Since the greatest geniuses were conceived to be masculine, it was correspondingly difficult to make room for the works of female artists in the lists of important art. The degree to which women have been hindered from practising art varies according to genre: arts such as painting and music have been highly exclusionary; literature and dance less so. Philosophically, the most important issue regarding the absence of women from the canon is the effect of this on the concept of art itself. Here conceptual analysis merges with social history: the idea of fine art includes the production of objects that are conceived not only to have enduring value, but to be public objects that are products of individual talent. Throughout the history of Western art, few women have had the access to education and studio training that men have enjoyed, and furthermore many of them have chiefly been assigned domestic roles. What they created in such an ambience were not the sorts of objects that could easily join the category of fine art, but were rather objects of domestic crafts, designed as much for practical function as for beauty or expressivity. Moreover, products such as quilts are often the work of many hands, making the creative talents of individuals hard to discern. Thus the limitations of education and social roles are not the sole explanation for the scant presence of women in the history of Western painting, music and sculpture. The reigning concept of art and its attendant notion of creative genius is blind to the objects that most women in fact have created during much of recorded history. In recognition of this fact, many feminist scholars of the arts are expanding the scope of their enquiries to include hitherto neglected genres, such as domestic arts and crafts or private diaries and letters, in order to bring the art of women of the past into full view.

3 Perception and the male gaze

Above it was noted that formative eighteenth-century theories of the beautiful frequently mention women as objects of beauty and aesthetic attention. This fact needs to be placed in context with one of the most influential ideas that has governed the idea of the aesthetic in Euro-American theory: that of disinterested attention. (Several terms are employed to express this notion, including distanced appreciation and aesthetic contemplation.) For two centuries this idea has formed the heart of theories of the aesthetic; indeed, it has virtually defined the notion. The aesthetic is classically defined as the realm of pleasure or enjoyment that is contrasted to practical, moral, religious or political interests. The desires of the individual perceiver are set aside in aesthetic enjoyment, which is a receptive state of appreciation of presentational qualities of an object of art or nature.

Such a description of a mental state makes it seem generic, that is, to be the same whoever is looking; gender difference would not be seem to play any role in the concept of aesthetic attention. However, feminist critics have juxtaposed this ideal mental state with standard examples of works of art: the history of art, sculpture and literature is rife with seductions and rapes, nude figures of odalisques and prostitutes. Sceptical about the figurative distance that the notion of the aesthetic puts between the viewer and the object, feminist theorists have speculated that the disinterested viewer actually assumes a position of power over the object viewed. Especially when the object is a (real or portrayed) female character or figure, the aesthetic attitude is one that assumes a kind of prerogative on the part of a viewer and passivity on the part of the object, whose chief purpose is to be posed for the enjoyment of the viewer. In place of the notion of disinterested aesthetic attention, feminists have introduced the notion of the ‘male gaze’.

While the general point is made for all art forms, the critique of aesthetic perception has been especially strong in discussion of the visual arts of film and painting. (The work of film-maker and theorist Laura Mulvey has been particularly influential.) The term ‘male gaze’ sums up an analysis of the privileged art connoisseur, who embodies a perspective of social dominance and particularly of traditional, patriarchal authority. Psychoanalysis provides a theoretical scaffolding congenial to many theorists of the gaze, because it fosters an understanding of how perception and pleasure become gendered. It is important to note that the viewer is in an imaginative masculine position, but need not actually be male. Male or female, socially powerful or marginal, the viewer assumes this position in order to appreciate art according to accepted norms. Nevertheless, identifying the ideal aesthetic position as masculine and patriarchal also raises questions about the critical, appreciative and interpretive act, and

about the uniformity of aesthetic responses.

4 Style

Given the above analysis of the history of aesthetic theory as gender-biased, and the suspicion that many of the central concepts and terms with which theory is conducted retain the mark of gender, what positive remedies are available to feminist theorists? Are there distinctions between the art works of females and those of males that might be developed into a 'feminine' aesthetic theory that offers fruitful alternatives to customary aesthetic values? Is there a discernible female creative tradition? Does feminist analysis suggest gender differences in looking, reading, listening or appreciating?

There are proponents of both affirmative and negative positions on all of these issues. A particular problem that must be addressed in answering any of these questions affirmatively is the problem of essentialism, by which is meant the view that all women at all times share certain common aesthetic responses or stylistic traits - identifiably feminine qualities that are manifest in spite of their social differences.

As feminist theory developed in the 1970s, some theorists argued that there are certain common themes and styles in women's art works. Since women regularly share experiences that are different from those of men, the case might be made that their common social histories yield similar artistic themes, such as childbirth and domesticity. Some tied thematic focus to speculations about style, surmising that fluidity and softness are more characteristic of feminine style than are rigid boundaries and divisions. Perhaps the strongest and certainly the most sophisticated suggestions regarding the feminine style have come from francophone theorists such as Julia Kristeva, Luce Irigaray and Hélène Cixous. Pursuing suggestions made by Lacan and Derrida that language represents the feminine only in terms of absence, these thinkers (in their different ways) introduce the possibility of writing that disrupts patriarchal, symbolic order. *L'écriture féminine* - one of the concepts that has issued from this work - is posited as women's writing that rejects patriarchal discourse and inscribes a distinctively feminine voice. This type of theory is both a deep critique of language that inscribes a patriarchal order in which women have no subject position of their own, and a visionary prescription for women's language once these fetters are recognized and broken.

Against these views lie the objections that such categorization merely mimics stereotyped notions of femininity; that women's social circumstances often vary; and that historical periods, positions of social class, race, ethnicity, nationality and religion are all factors that distinguish women from one another. According to this view, to look for a common 'feminine style' is to assume wrongly that there is some essential femininity to be discovered. An emphasis on variety in gender identities and fluidity of social roles undermines the search for distinctively feminine voices and styles. However, the search for common feminine aesthetic qualities needs to be distinguished from the empirical search for the work that women have created outside traditionally recognized art forms. Such a search presumes no female essence, but acknowledges that if one is going to study the work of women, one must look in the right places.

Not only have feminist perspectives in aesthetics been developed to re-examine assumptions and basic concepts and to envision alternatives, but it is also the case that aesthetics contributes to projects of feminist theory. Art, language and representation are powerful components of the formation of subjectivities and self-concepts, as well as of public culture; they perpetuate cultural norms and provide imaginative space for violating or transcending these norms. Thus the aesthetic and its pleasures, art, style and representation are locations for the investigation of gender and the boundaries of masculinity and femininity.

Feminist epistemology

The impact of feminism on epistemology has been to move the question 'Whose knowledge are we talking about?' to a central place in epistemological inquiry. Hence feminist epistemologists are producing conceptions of knowledge that are quite specifically contextualized and situated, and of socially responsible epistemic agency. They have elaborated genealogical/interpretive methods, have advocated reconstructions of empiricism, have articulated standpoint positions and have demonstrated the potential of psychosocial and post-structural analyses to counter the hegemony of epistemological master narratives. In these reconfigured epistemologies, feminists have argued that the cognitive status and circumstances of the knower(s) are central among conditions for the possibility of knowledge. They have demonstrated the salience, in evaluating any epistemic event, of the social arrangements of power and privilege by which it is legitimated or discredited.

Feminists are engaged at once in critical projects of demonstrating the privilege-sustaining, androcentric character of 'the epistemological project' in most of its received forms, and in transformative projects of reconstructing methodologies and justificatory procedures so as to eradicate their oppressive, exclusionary effects. They have shown that, in late-twentieth-century western philosophy, the circumstances of mature white men continue to generate prevailing ideals and norms of 'human nature', while the ideals of reason, objectivity and value-neutrality around which most mainstream theories of knowledge are constructed, like the knowledge they legitimate, tacitly validate affluent male experiences and values. Scientific knowledge, which is still an overwhelmingly male preserve, stands as the regulative model of objective epistemic authority; and the experiences and values of non-male, non-white and otherwise differently placed knowers typically have to accommodate themselves, Procrustean-style, to an idealized scientific and implicitly masculine norm, or risk dismissal as inconsequential, aberrant, mere opinion.

In engaging with these issues, most feminists - like many other participants in 'successor epistemology' projects - retain a realist commitment to empirical evidence, while denying that facts or experiences 'speak for themselves' and maintaining that most truths are as artefactual as they are factual. Questions of cognitive authority and answerability thus figure as prominently as issues of epistemic warrant in these projects, where feminists are concentrating less on formal, universal conditions for making and justifying knowledge 'in general' than on the specificities of knowledge construction. Hence these inquiries are often interdisciplinary, producing detailed analyses of everyday knowledge-making and of scientific or social scientific inquiry; drawing out their gendered and other locational implications. In these projects feminists are showing that avowedly engaged, politically committed investigations can yield well-warranted conclusions.

1 Epistemologies of privilege

Feminist epistemologies, like many other post-Enlightenment, post-colonial epistemological projects, have grown out of critical interrogations of the universalistic presumptions of the theories of knowledge of the Western philosophical tradition. Sceptical about the very possibility of developing a theory of knowledge 'in general', whose claims to universal validity are premised on its abstraction from the specificities of human circumstances, feminist epistemologists have insisted on the constitutive part that epistemic location plays in the making and evaluating of knowledge claims. Many of the best-established post-positivist and neo-rationalist theories of knowledge - together with the conceptions of reason, epistemic agency, objectivity, experience and knowledge itself that comprise their core - tacitly draw their conceptual and theoretical apparatus from an idealized view of the knowledge produced and validated by the (male) occupants of the dominant social, political and economic positions in white Western societies. The consequent distribution of epistemic authority perpetuates a hierarchical order in which women and other 'others' occupy the least authoritative positions. Eschewing traditional a priori approaches with their normative goal of determining what an ideal knower ought to do, feminists are producing critical and self-critical analyses of what variously embodied, historically and materially 'situated' knowers (in Donna Haraway's (1991) phrase) actually do, deriving normative conclusions from critical-constructive readings of epistemic practice.

The dominant epistemologies of modernity, as they have developed out of the Enlightenment with a later infusion of positivist-empiricist principles, have defined themselves around ideals of objectivity and value-neutrality. Ideal

objectivity, in post-positivist times, has come to mean a detached, neutral and disinterested approach to a subject matter that exists in a publicly observable space, separate from knowers/observers and making no personal claims on them. Value-neutrality elaborates this disinterested aspect to insist that knowers must have no vested interest in the object of knowledge and are responsible only to the evidence. Such ideals are best suited to govern evaluations of the knowledge claims of persons whose situations allow them to assume that theirs is a ‘view from nowhere’, that through the autonomous exercise of their reason they can transcend particularity and contingency and the accidents of gendered embodiment. Such persons have usually tended, within the social arrangements of affluent Western societies, to be white and male, though the specificity of their identity and circumstances are usually effaced in their self-presentation as ‘representative’ human subjects.

Ideals of Reason, both in theories of knowledge, and in their trickle-down effects in everyday discourse, have been consistent even across centuries of historical variation in yielding a regulative conception of rationality in which, as Genevieve Lloyd ([1984] 1993) has shown, traits, values and activities commonly associated with ‘the feminine’ are systematically suppressed. Analogously, feminists such as Evelyn Fox Keller (1985) and Susan Bordo (1987) have shown that the psychosocial characteristics that affluent, white, male children in such societies have commonly been nurtured to embody have been just those that prepare them for a lifetime of detached, objective control in everyday and scientific knowledge-seeking, and in a public world of work and deliberation. Instrumental reason and a science-derived ideal of knowledge have shaped conceptions of good epistemic practice, with consequences that are often exclusionary not just of women’s knowledge, but of the knowledgeable activities of other marginalized people. The point is not that women and other ‘others’ cannot emulate the ideal, but rather (as Lloyd has shown) that the symbolisms out of which the ideal acquires its (historically mutable) content work simultaneously to validate the knowledge and epistemic status of would-be knowers whose socio-culturally fostered character traits coincide with the ideal, and to suppress those whose subjectivities are differently produced. In short, feminist genealogies and deconstructions of these ideals have shown that, despite their proclaimed neutrality, they derive from, naturalize and normalize the experiences and social positions of privileged European men and their (male) descendants.

No simple taxonomy of feminist epistemologies classified as distinct or self-contained categories could present an accurate, state-of-the-art picture of these ongoing projects. Yet certain strands run through them, sometimes separately but usually intertwined. Here I elaborate the principal features of an empiricist strand in feminist theories of knowledge, of standpoint positions, and of genealogical and interpretive practices (see Feminism and social science; Gender and science §§1-2, 6).

2 Feminism and empiricism

The relationship between feminism and empiricism, both classical and post-positivist, has been uneasy. Feminists have to work with empirical evidence if they are to move knowledgeably about the physical world and engage effectively with the social, political and ‘natural’ realities that sustain hierarchical social structures. Yet, classical and many contemporary versions of empiricism are constructed around assumptions that are inimical to feminist emancipatory projects (see Empiricism). They are as androcentered as the liberal moral-political theories that they inform (see Liberalism). A woman can claim space within them only in so far as she is prepared and able to be ‘more like a man’ - that is to say, a privileged, able-bodied white man.

It is with the abstract individualism of empiricist orthodoxy, and its residues within everyday conceptions of knowledge in Anglo-American societies, that many feminists take issue. Individualist assumptions yield a picture of knowers as interchangeable in their autonomous epistemic projects, where they are at once sceptical of testimony and unswayed by emotion. Such knowers are ‘individuals’ in their place-holder status as units of analysis, yet they are never individuated. Correlatively, knowledge is objective, universally valid, available impartially and indiscriminately to everyone in identical observation conditions; and observation often reduces to simple, atomic givens, reportable in discrete propositions of the form ‘*S* knows that *p*’ (‘Sara knows that it is raining’). The apolitical character of such utterances, together with their paradigm (and often foundational) status in theories of knowledge, generates an assumption that all knowledge claims worthy of the title will be equivalently apolitical; and that propositional knowledge alone merits the (honorific) title ‘knowledge’.

Yet many classical versions of empiricism and their latter-day analogues come apart around a paradox: for all their alleged grounding in experience, that experience is itself an abstraction. Orthodox empiricists are not equipped,

conceptually or theoretically, to deal with real, idiosyncratic, specifically located experiences. Historical, gendered, locational differences reduce to bias, aberration, errors, to be eradicated and thence discounted in justificatory procedures. When empiricist claims are upheld within social-political structures that deploy a rhetoric of formal equality, yet depend upon structural inequalities to maintain themselves (as do liberal, capitalist societies), the elusiveness of their democratic egalitarianism is apparent. None the less, committed to eradicating uneven distributions of epistemic power and privilege - where gendered unevenness always intersects with the unevenness of race, class, ethnicity and other disprivileged locations - feminists have drawn, albeit critically and selectively, on the resources of many of these same theories to enlist them in transformative and emancipatory projects.

For feminist empiricists, then, the goal of inquiry, both secular and scientific, is to produce knowledge that is neither androcentric nor marked by sexist, racist, classist or other biases. They contend that an unabashedly value-laden yet rigorous empiricism can yield more adequate knowledge than methods whose practitioners are ignorant of their specificity, and of their complicity in a sex/gender system, can yield. Objectivity, in these feminist projects, is disconnected from the universalist assumptions on which analyses of knowledge ‘in general’ depend, and reconfigured around a requirement to take the subjectivity of the inquirers as seriously into account as the objects of inquiry. Thus for feminist empiricists, investigators cannot function as anonymous, isolated and silent spectators. They become answerable for their interventions and epistemic negotiations, as much to the epistemic community as to the evidence; and details about an inquirer’s epistemic location and interests are likewise subject to empirical scrutiny. The central idea is that politically-informed inquiry fosters a better empiricism, and what Sandra Harding (1991) calls a ‘strong objectivity’ that is more objective than an objectivity that defines itself by bypassing the conditions of its own possibility.

According to Lynn Nelson (1990), Quinean empiricism demands neither the stark individualism nor the theory-neutrality of the classical theories; hence it lends itself to feminist reconstructions in which communities, not individuals, are knowers and knowledge claims are entangled in and shaped by webs of belief, testable always against (communal) experience (see Quine, W.V. §2). For Nelson, communities are knowers in a strong sense, for which ‘individual’ experience and knowledge are possible only within a community. The point recalls Wittgenstein’s private language argument: it amounts to a contention that there could be no knowledge, no appropriately justified beliefs, without communal standards of justification and critique (see Private language argument). In a radical rereading of Quinean ‘naturalized’ epistemology, Nelson finds a rich resource for feminist successor epistemology projects (see Naturalized epistemology). Departing from preoccupations with determining whether knowledge is possible, naturalized epistemologies start from an assumption that people can and do have knowledge. Appealing to scientific psychology, they abandon transcendence to examine how people actually know, individually and socially. Yet because they adhere to principles of empirical objectivity and retain a realist commitment to ‘the evidence’, they are effective in producing reliable knowledge of the physical and social world. For Nelson, the value of these inquiries for feminist epistemologies depends on their being ‘socialized’ to focus on questions about how knowledge is made and adjudicated in gender-inflected social groups. Lorraine Code argues that it also depends on their taking an appropriately critical stance towards residues of a positivistic orthodoxy that informs much of present-day cognitive psychology, with the individualistic, tacitly masculine conception of ‘human nature’ it often presupposes. Jane Duran (1991) contests that conception by advocating a justificatory approach that is both naturalized and gynocentric, appealing to ‘essentially feminine’ principles. Object relations theory, psychoanalysis read through French feminist theory, and cognitive science will inform its studies of how gendered knowers are psychologically produced and reproduced, she maintains.

In the contextual empiricism that Helen Longino (1990) elaborates, evidential reasoning is context-dependent, and data count as evidence only in relation to background assumptions and hypotheses. Knowledge construction is a thoroughly social practice; hence acknowledging the constitutive role of values and ideology in inquiry does not require an indiscriminate tolerance of individual subjective preferences. Objectivity is ensured by high standards of social criticism, which all epistemic products must satisfy. Such criticism can unmask androcentricity and other ‘centricities’ even in ‘good’ science and inquiry, even from an admittedly interested position that is at once open to scrutiny and rigorously committed to working within the limits and multiple possibilities of empirical evidence.

Lorraine Code’s position is residually empiricist in its realism. Yet it departs from canonical versions of empiricism in its conception of socially constructed and interactive subjectivities, located and enacted within

uneven structures of power and privilege; and in situating issues of responsibility firmly within epistemological inquiry. Here the monologic individualism of post-positivist theories gives way to a picture of situated, socially embedded knowers conducting epistemic negotiations across the multiply configured rhetorical spaces of the social-political world. Code proposes that knowing other people is as exemplary an epistemic activity as knowing medium-sized physical objects, and that testimony is as crucial a source of knowledge as perception and memory. She advocates an ecologically modelled epistemology that draws on narrative analyses to position human knowing within interconnected systems of social, natural and other environmental relations.

3 Standpoints, interpretations, genealogies

Feminist standpoint theorists such as Patricia Hill Collins, Sandra Harding, Nancy Hartsock and Hilary Rose contend that neither orthodox nor feminist empiricists can adequately address the historical and material conditions that produce both epistemic agency and knowledge itself. Because the authoritative, standard-setting knowledge in Western societies is derived from and tested against the social experiences and material circumstances of white, middle-class, educated men, women (like the proletariat of Marxist theory) are oppressed in marginal, underclass epistemic positions. Science as practice has created an esoteric discourse to which few women and non-white men gain ready access. It explains their limited success with ‘scientifically proven facts’ about their natural intellectual inferiority: facts that have been established by a methodology not explicitly designed to oppress, but whose oppressive consequences are manifold. Yet it is possible to transform oppression into epistemic advantage. Just as Marxist inquiry started from within the lives of the proletariat to produce historically-materially located analyses that offered a sharply focused lens through which to inspect the social system as a whole, shorn of its naturalistic ideology, so starting from the diverse and often contradictory lives of women casts a critical frame around taken-for-granted epistemic hierarchies and practices of disempowerment. Collins (1990) claims, for example, that a Black feminist standpoint rooted in the everyday experiences of African-American women resonates with the epistemologies of subordinate groups in a multitude of disparate locations. It ‘makes strange’ the taken-for-granted practices of rejecting concrete experiences and testimony in favour of standardized abstractions, and it values wisdom over knowledge more conventionally (propositionally) conceived. And Rose (1983, 1994) maintains that an epistemology that bypasses the hands-on, affectively engaged labour that attests to a profound knowledge of the nature of things cannot hope to be adequate to the knowledge that enables people to work and live well.

A standpoint is more than merely a perspective, one among many. It is an achieved intellectual and embodied political position, forged out of painstaking analyses of the systems that legitimate oppressive practices, and firmly located *in media res*. Standpoints are neither guaranteed innocence, nor are they immune from criticism: their affinities with the consciousness-raising practices of the 1970s work to preserve a critical interpretive stance for which even first-person experiential claims have often to be interrogated, albeit responsibly, in mutually respectful debate.

Some critics claim that because there is no single, unified feminist position, standpoint theory obliterates differences and hence fails by its own feminist standards. Others argue that its ‘locatedness’ merely produces a perspective that is as limited as any other. Yet few self-identified standpoint theorists would assume that there can be a single privileged speaking position or one unified epistemic voice. Because they work from within the specificities of women’s lives and are resistant to the reductivism that obliterates lived, practical differences, they take limitation and partial perspective as facts within which epistemologies must be produced, not as obstacles they must seek to overcome. Points of commonality from one material, embodied location to another produce sites of feminist solidarity and opportunities for strategic coalition-building; points of difference confirm the necessity of ongoing critical negotiation.

In the interpretive and genealogical projects of postmodernity, feminists such as Linda Alcoff and Susan Hekman have found critical-constructive tools that work sometimes in concert with empiricist and standpoint theories, sometimes in tension with them. Interpretive strategies, with their origins in Gadamerian hermeneutics, contest any claim to the effect that experience, evidence or texts speak for themselves (see Gadamer, H.-G.). It is philosophy’s task to interpret the cultural-historical prejudgments out of which knowledge necessarily comes into being: prejudgments which are neither pernicious nor escapable, but which have to be confronted if the knowledge that they inform is to be adequate. Hekman (1990), for example, argues that all knowledge is interpretive; and Alcoff (1996) proposes a coherentist, ‘immanent epistemology’ that contrasts with transcendent, observational

theories of knowledge in revealing connections between power-infused political issues and epistemic justification.

Genealogical inquiry, with its Nietzschean origins and later Foucauldian elaborations, situates knowledge-production within historically changing structures of power, maintaining the radical contingency of currently hegemonic modes of understanding, legitimating, and establishing knowledge claims (see Genealogy). Some theorists, such as Kathy Ferguson, see a tension between interpretation with its presumed quest for one true original meaning, and genealogy with its commitment to unearthing a multiplicity of meanings which gain hegemonic status through complex power structures and strategies. Again, some self-identified feminist empiricists and/or standpoint theorists resist making common cause with these postmodern projects because they fear that such resistance to totalizing, stabilizing theory initiates a slide into a pernicious form of relativism. Others, such as Haraway, Code and Alcoff, see interpretation and genealogy as mutually informative; they draw on these strategies from within feminist inquiries that resist exclusive alignment with any single category or strand.

In their concentration on the real-world effects of knowledge-making within a community of inquirers, many of these feminist positions demonstrate affinities with the epistemological preoccupations that Charlene Siegfried discerns in the thought of the American pragmatists. Siegfried (1996) shows how feminism and pragmatism might make common cause as social movements inspired by the emancipatory potential of the everyday experiences of real, embodied and active knowers.

4 Implications

If feminist critiques are taken seriously, then epistemologists cannot assume that ‘reason is alike in all men’; nor can they represent knowers as mere place-holders in an infinitely replicable process, whose minds convert information, mechanically and indifferently, into knowledge. Many of the dichotomies around which western philosophy has been built are pulled apart under feminist scrutiny. Feminists have shown that such hierarchically ordered pairs as reason/emotion, mind/body, abstract/concrete, objective/subjective, theory/praxis, universal/particular - and of course male/female - with their persistent veneration of the first and devaluation of the second term, have sustained conceptions of knowledge and subjectivity that are neither dictated by natural necessity, nor exhaustive of the available options. Knowledge is as much body-dependent as it is mind-dependent; fostered as much by well-schooled emotions as by a well-honed reason; at once subjective and objective; its universal and abstract claims are only as good as their concrete and particular manifestations allow. Working across the territory opened out by the revealed instability of these dichotomies, feminists have resituated knowledge-constructing practices within human lives. They have reclaimed testimony as a source of knowledge as valuable (and as fallible) as perception and memory (see Testimony); and have challenged the divide that is often thought to separate ‘knowing how’, ‘folk wisdom’, and narrative knowledge from ‘knowledge properly so called’. Feminists have demonstrated the effectiveness of dialogic, negotiated epistemic deliberation and the integrity of local knowledge, contrasted with monologic or reductive pronouncements and projects designed to affirm the unity of science. Feminists are not alone in articulating these challenges: neo-pragmatists, deconstructionists and hermeneuticists, naturalistic epistemologists, Marxists, narrative theorists and reassessors of relativism, to mention only a few, often make good scholarly allies (see Cognitive pluralism; Epistemic relativism). But few of their projects are explicitly gender-sensitive to the extent that feminist inquiry has to be: hence feminist voices cannot simply speak in chorus with these other voices. Theirs are distinctive, and often necessarily dissident, speaking parts.

None the less, most late-twentieth-century feminists resist affirming simplistic, across-the-board alignments, say of men with objectivist, distanced, positivistic, scientific methods and women with subjectivist, connected, interpretive, non-scientific methods. Nor do they opt for an essentialism that would identify quantitative methodologies as male, qualitative ones as female; positivism as male, interpretation as female. Few would endorse a wholesale science-bashing that smacks more of ideological excess than of a genuine quest for knowledge. Even feminists who are wary of the oppressive effects of scientific and other authoritative knowledge rely upon its (intermittent) successes. Yet feminists are also convinced, on good evidence across a range of disciplines and areas of inquiry, that feminist research makes a difference. Hence questions about ‘method’, which are central to feminist epistemological debates become, in effect, questions about what difference feminism makes, and how. Its answers come from as many directions as there are epistemic practices. They are not reducible to a single, closed set of ideals and principles, for the era of theoretical and methodological monotheism has passed.

But they provide nodal points for ongoing deliberation and active engagement with social and material issues.

Feminist ethics

Critics greet feminist ethics with suspicion, alleging that it is biased towards the interests of women. Feminist ethicists reply that it is traditional ethics which is biased. As they see it, for centuries traditional ethicists claimed to speak for all of humanity, when they were speaking only or primarily for men, and the most privileged of men at that. In contrast, although feminist ethicists openly admit that they proceed from the perspective of women's experience, their paramount goal is simply to reconstruct traditional ethics so that it becomes more universal and objective by including women's as well as men's moral voices.

Far from being monolithic, feminist ethics encompasses a wide variety of woman-centred approaches to the moral life. Feminine *approaches to ethics, with their stress on personal relationships and an ethics of care, put a premium on the value of human connection.* Maternal *approaches focus on one relationship in particular, that between mothers and children, as the paradigm for moral interaction.* Lesbian *approaches stress choice rather than duty, aiming to define the conditions in which lesbian women can flourish. Finally, specifically* feminist *approaches to ethics emphasize the political task of eliminating systems and structures of male domination and female subordination in both the public and the private domains.*

1 Feminine ethics

Woman-centred approaches to ethics, as well as debates about gender and morality, are hardly new. Thinkers like Mary Wollstonecraft, John Stuart Mill, Harriet Taylor, Catherine Beecher, Charlotte Perkins Gilman, Elizabeth Cady Stanton and others considered the 'woman question' in the eighteenth and nineteenth centuries. They asked whether morality is gendered, and whether moral and psychological traits come from culture or biology. Such thinkers paved the way for twentieth-century debate about whether women's biology and maternal experience predispose them to espouse an ethics of care, while men's biology and public experiences predispose them to espouse an ethics of justice.

For centuries, men wrote most of the great books of ethics, speaking, as might be expected, from a male perspective. The response of those developing feminine approaches to ethics has been to offer the traditionally 'feminine' characteristics of care, compassion, benevolence, nurturing and kindness as no less morally significant than the traditionally 'masculine' characteristics of rationality, justice and independence. Among others, psychologist Carol Gilligan (1982) has claimed that women, for whatever reasons, tend to speak in a voice of care that focuses on concrete relationships, rather than in a voice of justice that focuses on abstract rules (see Virtue ethics §6). In the personal narratives of women contemplating abortion, for example, Gilligan heard more concerns expressed about the personal and professional needs of particular people than about a foetus' right to life or a woman's right to choose. Although Gilligan denies that she regards women's and men's respective moralities as decidedly separate, many of her critics still view her approach to morality not only as a deeply gendered ethics, but also as a highly femininized ethics meant to counter the supposedly 'masculinist' morality of psychologist Lawrence Kohlberg.

Kohlberg, who mentored Gilligan early in her career, constructed a six-stage scale of moral development: while men tend to ascend to at least stage five on this ladder, 'the social contract legalistic orientation', women tend to stop at stage three, 'the interpersonal concordance of "good boy-nice girl" orientation' (1971: 164-5). Doubting that women are in any way men's moral inferiors, Gilligan hypothesized that women did poorly on Kohlberg's scale simply because it was calibrated to gauge male, rather than human moral development. As such, she proclaimed it an inappropriate scale for judging female moral development. Whereas men typically interpret their greater independence and reliance on an ethics of justice as signs of their moral growth, Gilligan speculated that women tend to regard their greater interdependence and reliance on an ethics of care as signs of their moral growth (see Moral development; Moral education §1).

Nell Noddings' relational ethics is another example of a 'feminine' approach to ethics. In any good human relationship, says Noddings (1984), there is the 'one-caring' and the 'cared-for'. The one-caring should engross themselves in the cared-for, focusing on their needs, actions and thoughts. In return, the cared-for should welcome the one-caring's attention and willingly share their own needs, hopes and accomplishments with the one-caring. Noddings believes that caring consists more in specific obligations to particular people than in general duties to

human kind. Concrete actions, far more than abstract intentions, define real caring.

There is reason to suspect, however, that Noddings - like Gilligan - makes caring the special province of women. Although Noddings claims that caring should be the responsibility of all humans, in most of her examples the carers are women, some of whom push their acts of caring to the point where their own identity, needs, and even existence are sacrificed. Thus, many critics fault Noddings as well as Gilligan for over-stressing women's role as carers. As Sheila Mullett points out (1988), since equality of care between men and women is unlikely in a still patriarchal society, caring remains dangerous for women. Until full social, political and psychological equality between the sexes exists, men will be inclined to let women take care of them without reciprocating the favour.

2 Maternal ethics

Critics also express reservations about maternal ethics, another feminine approach to ethics. Virginia Held (1993), Caroline Whitbeck (1974/5) and Sara Ruddick (1980) all offer a good mother-child relationship as a promising paradigm for any relationship. They find the traditional rational-contractor model inadequate (see Contractarianism). After all, most human connection and interaction does not take place between equally autonomous, powerful and informed adults (typically men). Instead it occurs between unequals, such as parent-child, student-professor, professional-client, doctor-patient, and employer-worker. Therefore, a caring, although unequal, mother-child relationship provides a normative standard for the assessment of relationships that are inevitably imbalanced. Presumably, mothers have their children's best interests at heart. They try to protect and teach them, and make them socially acceptable and successful. In the process, they teach both themselves and their children to be sensitive, responsible people, aware of others' needs (Ruddick 1984) (see Family, ethics and the §5).

Both feminists and non-feminists challenge maternal approaches to ethics, however. Non-feminist critics object to using one relationship in particular as a moral paradigm for all relationships in general, especially a relationship that seems to exclude all men and non-reproducing women. Feminist critics also challenge the adequacy of the mother-child relationship. As they see it, in a patriarchal society, mothers are already laden with guilt, expectations and demands. They doubt that anyone, but especially women, should seek to emulate the all-sacrificing mother who denies her own needs to serve those of her child. Instead people should pattern their relationships on a good friendship relationship (see Friendship). Like the mother-child paradigm, a friendship paradigm rings truer with our moral experience than the abstract rational-contractor relationship; unlike the mother-child paradigm, however, it comes closer to signalling the kind of give-and-take only equals can achieve.

3 Lesbian ethics

The women-centred approach to ethics most specifically tailored for women is clearly the lesbian one. Lesbian ethicists focus unapologetically not simply on women, but on women-loving women. Lesbian approaches are varied and complex, and generalizations are difficult, but most lesbian approaches seem to replace the traditional moral question, 'Is this action good?' with, 'Does this action help my quest for freedom and self-identity?' Although lesbian ethicists stress choice rather than duty, they are not relativists (see Duty; Moral relativism). As Sarah Lucia Hoagland asserts (1988), lesbian ethics concerns community: when a lesbian chooses for herself, she chooses for other lesbians, and those lesbians in turn will choose for her. Ethics, on this view, involves not an individual lesbian doing what she believes is absolutely right, but a community of lesbians weaving moral values together. Moral value and meaning is born and sustained in the spaces between oneself and others. Lesbian ethicists seek to become persons 'who are not accustomed to participating in relationships of domination and subordination' (1988: 241), but who are 'playful' beings with 'the ability to travel in and out of each other's world' (Lugones 1987: 13). To the degree that lesbians learn to move among and delight in a variety of worldviews, they lose interest in using ethics as what Hoagland has termed a 'tool of control' (1988: 246).

4 Feminist ethics

What makes specifically feminist approaches to ethics different? The answer is their strong emphasis on politics. Susan Sherwin aptly comments that a feminist approach to ethics 'applies a specifically political perspective and offers suggestions for how ethics must be revised if it is to get at the patterns of dominance and oppression as they affect women' (1992: 42). Feminist ethicists focus not so much on goodness as on power. They emphasize the ways in which traditional approaches to ethics maintain a status quo oppressive to women.

Many feminists discuss ways in which traditional ethics support women's subordination. Alison Jaggar, for example, discusses five specific ways in which this occurs, in her essay, *Feminist Ethics* (1992). First, traditional ethics focuses on men's rights and interests at the expense of women's. Indeed, traditional ethics has even encouraged women to develop supposed 'virtues' like patience and self-sacrifice that tend to further women's subordination. Second, traditional ethics justifies its neglect of women's interests by claiming that important moral questions rarely arise in women's world, the domestic sphere. Thus, women's double-workday, reproductive burdens, and sexual vulnerabilities, for example, are often dismissed as 'private' matters of little genuine moral significance. Third, traditional ethics often adds insult to injury by alleging that women are men's moral inferiors. Since the time of Aristotle and Plato, to Freud and the present day, (male) philosophers have described women as capable of only limited moral thought and action. Fourth, traditional ethics tends to overrate traditionally masculine traits such as 'independence, autonomy, intellect, will, wariness, hierarchy, domination, culture, transcendence, product, asceticism, war, death', and to undervalue traditionally feminine traits, such as 'interdependence, community, connection, sharing, emotion, body, trust, absence of hierarchy, nature, immanence, process, joy, peace and life' (Jaggar 1992: 364). Finally, traditional ethics tends to employ a 'masculine' way of thinking characterized by rules, abstraction, and impartiality, eschewing 'feminine' ways of thinking as 'emotional', rooted as they are in relationships, particularity, and partiality.

As a remedy for the sexism in traditional ethics, Jaggar suggests a feminist approach to ethics that does at least the following: (1) begins by acknowledging that men and women have different experiences and situations in life; (2) provides guides to action 'that will tend to subvert rather than reinforce the present systematic subordination of women'; (3) offers action guides and approaches to handle issues in both the public and the private realms; and (4) 'takes the moral experience of all women seriously, though not, of course, uncritically' (Jaggar 1992: 366). Thus, feminist approaches to ethics - unlike feminine and maternal approaches - do not call upon women to become exemplary carers. Nor do they, like lesbian approaches, ask women to develop meaning and value only for women-loving women. Instead, feminist approaches call upon women *and* men to overcome gender inequality and oppression. Therefore, they offer something of value to all human beings - for care, justice, and moral value can flourish only in a truly equal and balanced world.

Feminist jurisprudence

The diversity of feminist philosophy and theory is represented in feminist jurisprudence, but two models of feminist jurisprudence predominate: the parity model, according to which women should be given legal parity with men; and the transformative model, which proposes the transformation of male legal categories and concepts to address women's experiences. The parity model has also been identified by the terms 'the male monopoly of law', or 'law as male bias'. The transformative model has sometimes been equated with feminist jurisprudence per se, *sometimes more specifically with US feminist jurisprudence. The two models differ primarily in their response to the claim of liberal jurisprudence - a claim made by law itself - that law is a neutral, rational and fair institution which defends individual liberty and treats people equally. The models also differ over the analysis of rights, and over the place of feminist jurisprudence in the legal curriculum. Both models have been subjected to a subversionist critique of any form of feminist jurisprudence.*

The parity model supports the values of liberal jurisprudence as imputed to law, but identifies a discrepancy between those liberal values and legal practice, such that women are not accorded parity with men. It follows either that law must be persuaded to apply these standards more rigorously in the case of women or that liberal values must be revised to recognize gender as a source of social injustice. The objective is to give women genuine, as opposed to nominal, equal rights or, where their special social situation demands it, special rights. On this model, courses in feminist jurisprudence comprise what have come to be known as 'women and law' studies which generally promote the visibility of women in jurisprudence. These studies may include documentation of law's discrimination against women, analyses of law's male bias against women, and reviews of all liberal jurisprudence which omits reference to gender.

The transformative model also notes the discrepancy between the liberal values imputed to law and law's treatment of women but recognizes the limitations of attempting to close the gap between liberal jurisprudence and legal practice either by making law apply liberal principles more scrupulously in the area of gender or by revising liberal principles. Instead, feminists working with this model argue that liberal jurisprudence can make no impact on law's treatment of women so long as legal categories, such as crime or family law, and legal concepts, such as provocation or marriage, embody male norms and accordingly fail to address women's experiences. It follows that such legal categories and concepts must be transformed to address women's social position and experiences. In so far as rights discourse embodies male norms, it too must be transformed. On this view, courses in feminist jurisprudence comprise the transformation of broad legal categories and specific legal concepts so that they engage with the reality of women's lives.

The subversionist critique seeks to undermine both the parity model and the transformative model. This critique questions the value of feminist jurisprudence for feminist politics. The reason given is that to work within the paradigm of jurisprudence is to legitimate the strategy of recourse to law as the proper means of solving social problems, the very strategy which both the parity model and the transformative model have exposed as inadequate. The subversionist critique recommends instead that feminists subvert the paradigm of jurisprudence, if necessary by abstaining from engagement with it. The use of rights discourse becomes a tactical calculation, and the inclusion of feminist jurisprudence in the law curriculum is a dubious strategy for feminists. The subversionist critique has been criticized in its turn for undervaluing the achievements of liberal legal systems and liberal jurisprudence.

1 The parity model

Central to the parity model of feminist jurisprudence is the theory of law as an institution for the defence of individual liberty and the resolution of disputes between individuals which upholds the values of neutrality, rationality and fairness, all individuals being equal before the law. This doctrine is fundamental to law's conception of itself, as expressed in the ideology of the rule of law, and it provides the rationale for the introduction of equality legislation, such as anti-discrimination and equal pay legislation. It is also typical of contemporary jurisprudence dedicated to the development of liberal theories of justice. For example, Rawls (1972) is a major exponent of the liberal jurisprudential doctrine of justice as fairness. Similarly, Dworkin (1978) is concerned to develop a jurisprudence according to which all people have the fundamental right to be treated as

equals (see Dworkin, R.; Rawls, J. §1).

The parity model of feminist jurisprudence subscribes to such liberal doctrines, but identifies a discrepancy between liberal principles and legal practice such that, in failing to uphold the values of neutrality, rationality, fairness, and liberty and equality in their treatment of women, neither the law nor contemporary liberal jurisprudence ascribes parity to women (see Law and morality §2). The parity model offers two main types of argument to support that claim: the socio-legal and the philosophical.

First, Sachs and Wilson (1978) have amassed a wealth of socio-legal materials to show that the law has systematically operated as a male monopoly. They examine the 'persons' cases in the UK and the 'monopoly cases' in the USA, which focus on the law's resistance to extending the category of the legal person to include women. They argue that, through the biased use of judicial discretion, the judiciary has pursued male interests in maintaining obstacles to women's entry into public spheres of citizenship and the professions, notably medicine and law.

The work of Sachs and Wilson has provided the impetus for many similar socio-legal studies revealing the discrepancy between anti-discrimination legislation, such as the principle of equal pay for work of equal value, and the actual benefits experienced by women (see Discrimination). Feminists have identified sex stereotyping as a key mechanism for maintaining this discrepancy. For example, Atkins and Hoggett (1984) argue that the law has consistently worked on the assumption that women are primarily dependent on men, and that their lives are defined by their domestic and sexual roles. These socio-legal materials are the basis for the parity model's claim that, in its failure to uphold its own proclaimed values of equality and neutrality, the law continually fails to accord parity to women.

Here, the parity model urges ever more vigilance in the pursuit of genuine equality for women and their unbiased treatment in legal practice. The strategies include general vigilance for discrepancy between law's stated values and intentions and its actual practice in relation to women, political pressure for improved anti-discrimination legislation, the introduction of gender issues into legal education, and reform of the judiciary and parliament so that women's issues are given greater recognition.

Second, feminist philosophers have challenged liberal jurisprudence for its articulation of the values of liberty and equality in ways which neglect the inferior social status of women. For example, Pateman (1988) has criticized Rawls' theory of the social contract, in particular his use of the 'original position'. She argues that Rawls' attempt to justify our intuitions about contemporary society incorporates implicit but unjustifiable assumptions about gender and sexual relations, thereby obscuring 'the sexual contract' which provides the foundation of modern patriarchy and the political right of men over women. Similarly, Okin (1989) has pointed to the omission of family justice and gendered family structures from contemporary theories of social justice. This omission reinforces the notion of justice as a public virtue, and, in perpetuating women's exclusion from social justice, impedes progress towards a just and democratic society (see Justice §6).

The parity model of feminist jurisprudence here requires revision of liberal jurisprudence so that the social significance of gender inequalities is given due recognition. Of particular importance is the need to extend the scope of liberal jurisprudence so that it is not restricted to the public sphere of social justice but extends also to the private sphere. By pointing to the limitations of liberal jurisprudence in this regard, feminists hope to undermine the assumption that the attribution of formal equality to women is sufficient to ensure that women enjoy material equality with men. Working within the parity model, feminists have identified the discrepancy between women's formal equality, for example in labour legislation, and their material inequality, for example through financial disadvantage incurred by their assumption of domestic and child-rearing responsibilities.

This concern with the neglect of the private sphere is typically expressed in terms of rights. For while the parity model accepts the claim of liberal jurisprudence that rights are the inalienable moral possessions of equal individuals, feminists have pointed out that many rights have not been fully enjoyed by women. While liberal jurisprudence articulates concepts of rights situated in the public sphere, such as civil rights, the parity model emphasizes rights which should be enjoyed in the private sphere, such as the right to protection against domestic violence (see Privacy §4).

A corollary of this view is scepticism about campaigns for women's rights expressed in terms of equal rights when

these are inappropriate to women's social situation. Here supporters of the parity model argue that women need special rights in recognition of their different social position from men's, particularly in the sphere of reproductive rights and in the institution of the family. Yet there are difficulties in determining when special rights are more appropriate than equal rights. Accordingly, some feminists within the parity model have become disillusioned with the potentially divisive nature of rights and argue that rights discourse must be transcended in order to achieve the goals of a communitarian society in which persons can live as genuine equals with respect for their different talents (see Rights).

On the parity model, courses in feminist jurisprudence comprise what has come to be known as 'women and law' work: cataloguing the failures of anti-discrimination law and equality legislation, the operation of male bias and sexist stereotypes (for example, in family law), the shortcomings of legislation and legal practice in the areas of abortion, rape and domestic violence, and exposure of the legal profession's exclusion of women. The parity model of feminist jurisprudence also includes the revision or adaptation of liberal jurisprudence to produce analyses which draw attention to gendered social institutions, such as the family, as major sources of social injustice.

The parity model has been subject to the criticism that the discrepancy between liberal principles and legal practice cannot be made good either by exhorting law to uphold them more scrupulously or by revising liberal principles. The reason given is that, by concentrating on the discrepancy between liberal principles and legal practice, and by giving prominence to 'women's issues', the parity model leaves intact existing categories of law, such as crime and family law, and existing concepts of law, such as provocation and marriage. These criticisms are more fully developed by feminists working within the framework of the transformative model of feminist jurisprudence.

2 The transformative model

The transformative model follows the parity model in noting the discrepancy between the liberal values imputed to law and law's actual treatment of women. But feminists working with the transformative model argue that the attempt to make good that discrepancy either by reforming legal practice or by amending liberal jurisprudence is doomed. The attempt is doomed because it leaves undisturbed broad legal categories and legal concepts which embody male norms and which consequently fail to address the reality of women's social position and experiences. It follows that these legal categories and concepts must be transformed so as to address the concrete reality of women's lives. There are two main versions of the transformative model of feminist jurisprudence: the systematic and the thematic.

The systematic version is associated almost exclusively with the work of MacKinnon (1989). She argues that the legal manifestation of the liberal state is institutionalized male power based on male sexual dominance of women. She identifies two main ways in which law effects male domination. The first is by the eroticization of sexual abuse, so that legislation on rape, prostitution and obscenity is proposed ostensibly for the protection of women but works in practice to protect men's sexual power over women. The second is by law's claim to the standard of neutrality. Here MacKinnon argues that it is futile and dangerous for feminists to demand that law apply this standard. For this legal standard is itself male. Furthermore, the greater the *prima facie* neutrality of law - for example, in equality legislation governing paid work - the more effectively 'neutrality' works as a key mechanism for masking the law's defence of male domination, for example, by requiring women to fit into an economic system which denies them substantive equality.

For these reasons, MacKinnon believes that feminists have wrongly made their demands in terms of rights, whether equal or special, because the pursuit of rights requires women to aspire - in vain - to men's rights. Rights are little more than the expression of institutionalized male power. Consequently, MacKinnon advocates the development of a feminist jurisprudence, namely the systematic inversion of the complete and comprehensive institutionalization of male power and ideology, all derived from male sexuality. This feminist jurisprudence would have a central place in legal education.

Other feminists working with the transformative model, however, have reservations about the project of an exclusively feminist jurisprudence. They suspect that it is a form of essentialism, namely the view that masculine law and feminine law are discrete and unitary spheres. On this view, MacKinnon's feminist jurisprudence is essentialist because it theorizes women as the permanent victims of male sexual power. Instead, these feminists

have advocated the development of thematic feminist jurisprudence through the strategic transformations of key areas of law. This exercise is characterized by two linked approaches: first, the transformation of legal categories; and second, the transformation of legal concepts.

Key exponents of the transformation of legal categories are Graycar and Morgan (1990). They show how it is not possible to consult a traditional legal textbook for the collected legal rules and regulatory practices concerning, for example, domestic violence. Relevant material will be found in textbooks on criminal law, family law, housing and social security rules, tort law, and in some jurisdictions constitutional law. These classifications, however, are meaningless for women who experience domestic violence. They and their lawyers typically need to identify an immediate practical remedy, one which can be rapidly selected from a compendium of legal doctrines and rulings related specifically to domestic violence. Graycar and Morgan accordingly engage in a fundamental recategorization of law according to themes such as women’s sources of financial income, legal responses to motherhood, and gendered injuries to women, such as rape.

The transformation of legal categories may well involve the transformation of specific legal concepts. For example, feminist scrutiny of criminal law from the point of view of women’s experiences has focused on provocation as a partial defence open to women and men charged with murder. For the charge to be reduced to one of manslaughter, the accused needs to prove that the act of killing followed a sudden and temporary loss of control, such as might be experienced by a person goaded beyond endurance. Feminists have argued that this concept of provocation embodies male norms of physical strength and anger. One feminist response, articulated by the pressure group Rights of Women (1992), has been to recommend the introduction of a new partial defence to murder, namely self-preservation. This defence would be open to persons who kill someone who has subjected them to continuing sexual and/or physical abuse and intimidation, to the extent that they honestly believe they have reached a point where there is no protection or safety from the abuse and that they will die if the aggressor remains alive.

A further example of the transformation of a specific legal concept to reflect women’s lives is Howe’s use of the term ’social injury’ (1991). This concept has had an established use in criminology, where it was used to broaden the definition of crime to include injury to the state, thereby bringing white-collar crime within the scope of criminology. Howe appropriates this concept for feminist jurisprudence with the identification of social injuries which are gender-specific, or social injuries by gender stereotype. The transformed concept can then be used to theorize not only offences such as rape, sexual assault and domestic violence but also superficially gender-neutral offences under anti-discrimination legislation and divorce law reform.

The scrutiny of legal categories and concepts for the extent to which they embody male norms will also include the investigation of rights discourse in law-oriented feminist campaigns. Unlike the systematic transformative model, however, the thematic transformative model makes no a priori judgment about whether feminists should continue to use appeals to rights. Rather, each instance of rights discourse requires evaluation. Sometimes the appeal to a right has great popular appeal for a specific cause; none the less it may have damaging implications. For example, justifying abortion as a woman’s right to choose has been a powerful slogan for law reform. At the same time, it invites the assertion of counter-rights, such as fathers’ rights and foetal rights, which are potentially damaging to women. Instead, feminists have argued, rights discourse in the context of abortion needs to be transformed into ‘safe strategies’ which emphasize not the individual choice of a pregnant woman but social responsibility for women in a state of emotional distress and economic need.

The principle that feminist jurisprudence should transform legal categories and concepts to reflect the reality of women’s lives is carried into the legal curriculum. At Dahl’s law school in Oslo, there are specialist courses in women’s law (1987). These organize materials from existing law into collections which follow the typical pattern of women’s experience, such as money law, law surrounding birth, and housewives’ law. Further, all mandatory courses in the law school are required to include feminist legal analyses. Where such radical measures are not possible, however, feminists have also seen the merits of a process of ‘infecting’ the traditional legal curriculum with feminist perspectives.

The main criticism of the transformative model, whether in its systematic or thematic form, is that feminist jurisprudence is of questionable value for feminist politics. This is because, however much feminists seek to transform legal categories and concepts, feminist jurisprudence remains a form of jurisprudence. As such it will

retain the notion, common to all forms of jurisprudence, that law is the proper site for the resolution of social conflicts. Yet feminist analysis has shown that this strategy has been unreliable for the achievement of feminist goals. This criticism constitutes the subversionist critique.

3 The subversionist critique

This critique does not comprise a third model of feminist jurisprudence; rather it constitutes a warning to feminists about the impressive resilience of jurisprudence in the face of critical analyses in and from other disciplines. Of special note is its capacity to absorb and redefine interventions issuing from feminist analyses.

On this view, every engagement with law, either as an object of theoretical analysis or as a political reality, needs to be reprimanded by the reminder that, by entering on to the terrain of law, and by implication the field of jurisprudence, the endeavour may be, and probably is, conceding territory for law’s hegemony. To the extent that it is incorporated within the paradigm of jurisprudence, feminist jurisprudence will reproduce the assumption that law is the proper terrain for feminist politics. Feminist jurisprudence is therefore in danger of collusion with jurisprudence. For example, according to the subversionist critique, the feminist recommendation that criminal law introduce self-preservation as a new partial defence to murder is helpful to women only when they are already embroiled in certain criminal law procedures; it leaves unanswered the question of whether the courts are the appropriate context for solving problems of domestic violence.

A further example of the subversionist critique draws attention to feminist engagement with the policy debate on how women should be supported financially after divorce. Smart (1984) shows that the policy debate is constructed so that the policy options are reduced to only two alternatives: support by former husbands or support by the state. Smart has argued that neither option permits a satisfactory answer, because feminists have argued both for women’s financial independence from men and for recognition of the value to their husbands of women’s unpaid domestic labour in the fixing of maintenance payments.

It follows easily from this example of the subversionist critique that formulating feminist politics in terms of equal rights, or indeed in terms of special rights, is unlikely to produce justice for women. For rights are law’s preferred language, and they are tainted with law’s claim to sole authority to adjudicate disputes between individuals who advance competing rights claims. Similarly, the inclusion of feminist jurisprudence into legal education carries all the risks of assimilation - the depoliticization of feminism in the academic sphere.

The subversionist critique has itself been criticized for its tendency to undervalue the genuine achievements of liberal legal systems and of liberal jurisprudence. For example, it undervalues relatively liberal abortion legislation, anti-discrimination legislation, and greater awareness on the part of the judiciary of the need to strengthen the position of vulnerable female cohabitants. Similarly, the subversionist critique misguidedly undermines the success of feminists working with the transformative model of feminist jurisprudence in forcing liberal jurisprudence to acknowledge gender as a significant social division impeding progress to greater social justice.

Feminist literary criticism

Feminist literary criticism looks at literature assuming its production from a male-dominated perspective. It re-examines canonical works to show how gender stereotypes are involved in their functioning. It examines (and often rediscovers) works by women for a possible alternative voice. A study of the social suppression and minimalization of women's literature becomes necessary. These questions emerge: What is sexual difference and how has it been represented? How has the representation of woman relied on a presupposition of inequality between the sexes? Is there a feminine essence, biological or otherwise, that produces 'women's writing'? Feminists who believe that a 'woman' is culturally or socially constructed look for evidence of that process in literature. The socio-cultural and politico-economic construction of sexual difference is 'gender.' A study of the difference between sexual and gender difference can establish alliances with gay and lesbian studies. Feminist criticism sometimes relates to psychoanalysis and/or Marxism, criticizing their masculinism and using their resources. It expands into film/video as well as social-scientific or philosophical texts. Feminists sensitive to racism and imperialism demonstrate the culture-specificity of all of the above.

1 History

Although the remote antecedents of feminist literary criticism may be located in many ways, the source-texts of modern feminist criticism are Virginia Woolf in Britain and Simone de Beauvoir in France. The generations that came of age during the Vietnam War found evidence of discrimination against women within the New Left Anti-War movement in the USA. In Britain, a comparable dissatisfaction with Marxism is to be found in works such as Sheila Rowbotham, Lynne Segal and Hilary Wainwright's *Beyond the Fragments* (1979). Women of the 'baby-boom' generation (born at the end of the Second World War), though not necessarily involved in political struggle, became increasingly dissatisfied with the treatment of women at home and in the workplace. This combination of protest and dissatisfaction worked to produce the first wave of feminist literary criticism in the USA and Britain. The first important texts are Elaine Showalter's A *Literature of Their Own* (1977) - echoing Woolf's title *A Room of Her Own* - and Sandra Gilbert and Susan Gubar's *The Madwoman in the Attic* (1979) - establishing Charlotte Brontë's *Jane Eyre* as the model feminist text (see Feminist political theory §2).

British feminist criticism was, at its inception, more marked by a sociological and psychoanalytic stance (see Feminism and social science; Feminism and psychoanalysis). Two path-breaking texts in this mode are *Women Take Issue* (1978) and Juliet Mitchell's *Psychoanalysis and Feminism* (1974). In the field of literary criticism proper, British feminists were reading US books such as Mary Ellmann's *Thinking About Women* (1968).

Although Simone de Beauvoir's *The Second Sex* (1949) was internationally influential as a source-text of feminist consciousness, it had little acknowledged influence on French feminist literary criticism. In France, feminist literary criticism was less disciplinary, more imbricated in the general social field than in the USA, where the professionalization of the academy is more systematic, and the apparent possibility of resistance more academically tolerated. The bringing together of Marx and Freud, or the feminization of philosophy, was the agenda of interventionist intellectual French feminism. The events of May 1968, when workers and students came together and almost toppled the State, were a motive force of French feminism. The groups *Psych et po* (psychoanalysis and politics) and *Cheveux longues idées courtes* (long hair short ideas) convey an idea of these characteristics of the French scene.

By the 1990s, Julia Kristeva, with her new readings of Freudian psychoanalysis, and Helène Cixous, with her writerly assimilation of the philosophy of deconstruction, had come to dominate the French feminist literary-critical scene. (It should be noted that the word 'feminism' denotes a particular group-politics in France, and therefore would not necessarily be acknowledged as a description by either of these women.)

In the USA and Britain, the impact of French feminist theory has divided the feminist literary-critical scene into two broad camps. (The work of the philosopher Luce Irigaray must also be counted as a French influence on literary criticism written in English.) This division is charted in Toril Moi's *Sexual/Textual Politics* (1985). In the field of feminist literary, film and cultural criticism the work of bell hooks (Gloria Watkins) has been a sustained combative voice. Black feminist criticism is in many ways at the cutting edge of British and US feminist thought.

As mentioned earlier, *Women Take Issue* was one of the early texts of British feminist cultural and literary intervention. Emerging as it did from the Birmingham School of Cultural Studies, it was a statement from postcolonial Black British women. (Hazel Carby, one of the chief spokeswomen of that group, has since moved to the USA and works both in the area of restoring the history of literature by African-American women as well as laying down ground-rules for a cultural critique of the representation of Black women, using some of the categories established by the philosopher Louis Althusser and the sociologist Stuart Hall.) In the USA, where the history of slavery, 'settlement' of indigenous peoples and immigration is complex and multi-layered, 'multiculturalist' feminist literary criticism began to appear in the 1980s, although the label is of later provenance. Cherrié Moraga and Gloria Anzaldua's *This Bridge Called My Back* (1983), with its focus on Chicana feminism, was an important early text of cultural criticism. As a result of a change in US Immigration Law in 1965, the influx of Asian immigration increased 500 per cent. It was among second-generation women of this group that a specifically 'postcolonial' multiculturalist feminism took root (see Multiculturalism §3). A not uncritical but fruitful exchange between the former British and French colonies and the metropolitan countries has been the result. In the British and French context might be mentioned Buci Emecheta from sub-Saharan Africa, Assia Djebar and Nawal el-Saadawi from North Africa, and Meenakshi Mukherjee from India. Feminist literary criticism from Japan and the Philippines is closely interactive with feminist criticism in the USA.

The relationship between feminist literary and cultural critique and the women's movement in the various countries mentioned here is a subject that must be taken into consideration in any extended study. Luce Irigaray (and Michel Foucault) in France, cultural workers such as Pratibha Parmar in Britain, and theorists such as Judith Butler in the United States have shown how an apparently empirical positioning outside heterosexuality can provide new presuppositions for general ethical, social, legal and cultural speculation. Their work is important for those feminists who feel that the alliance with gay and lesbian studies means a fuller critique of the assumption that the historico-legally sanctioned 'male' perspective is objective and just.

In colloquial academic parlance, and taking mainstream Britain and the USA as our examples, 'sixties feminism' was marked by protest and 'consciousness-raising' (collective self-education through sharing personal experience), 'seventies feminism' was Eurocentric and essentialist (emphasizing benevolent middle-class women as women as such); 'eighties feminism' was obliged to take race-class-gender and 'theory' into account; and 'nineties feminism' was marked by a post-feminist and/or multiculturalist impatience by the generation that grew up on, or on the other side of, the gains of 'white' feminist struggle. Feminist literary criticism relates to this general movement. A vade mecum for the twenty-first century is yet to be established.

2 Theory

If the feminine is ungeneralizable as the human, what is the validity of the human sciences? This is the first question of feminism. All methods that question the validity of the apparently reasonable can therefore potentially be its ally. This is how Marxism, psychoanalysis, the general critique of 'humanism', multiculturalism and multi-ethnicity (questioning 'Europe's claim to the culture of Reason), and gay theory (questioning the heterosexual male as the model of man), have contributed their methodological resources to feminism. At the same time, their theory and practice have also been questioned for participating in masculinism. Mainstream feminism, which builds on the strengths of liberal humanism, adopts Marxism via the Engelsian narrative of the origin of the family (Friedrich Engels, *The Origin of the Family and Private Property*; Gayle Rubin, 'The Traffic in Women') or the theory of the modes of production (Christine Delphy, *Close to Home*); psychoanalysis via its Oedipal storyline (Nancy Chodorow, *The Reproduction of Mothering*), and multiculturalism as liberal pluralism with an enlightened civil society at the centre. Feminist literary and cultural criticism are related to these moves.

Lively controversies within feminist literary and cultural criticism are a sign of its strength. The main line of debate is between 'essentialism' and 'anti-essentialism,' although sometimes the rubrics used are different. Is woman a special kind of human being by nature (or essence)? Or is what is understood by the word corresponding to 'woman' in English, a cultural and social construction? These seem to be the broad lines of the controversy.

There is a smaller group of more radical 'anti-essentialist' feminists who presume that the necessary focusing or centring of the thinking and acting subject may not be accessible to direct analysis. Whether such feminist literary and cultural critique can be 'politically engaged' is a question that is not without consequence.

If the non-'European' feminine is ungeneralizable as woman, socio-culturally constructed or otherwise, what is the validity of Eurocentric feminism? (The 'European' here is of Northwest Europe or its legacy: Euro-US, Euro-Australia, Euro-Canada.) The poignancy of this question is that it can only be asked for global attention by women marked by the modern university - an institution developed within the European tradition - or by migrancy - a Eurocentric phenomenon. Testimonies obtained from non-academic Third-World women are sometimes used in an effort to bypass this problem.

Feminist political philosophy

In all its forms, feminism asserts that social and political structures in society discriminate against women. Feminist political philosophy aims to show how traditional political philosophy is implicated in that discrimination and how the resources of political philosophy may nevertheless be employed in the service of women. Sometimes, feminist political philosophy extends the arguments of traditional political philosophy to indicate that women are unjustly treated and to propose ways in which that injustice might be removed. This is clearest in liberal feminism, where it is argued that since women are essentially the same as men in being rational creatures, they are entitled to the same legal and political rights as men: arguments which defend the rights of man also support the rights of women. Similarly, Marxist and socialist feminism extend the insights of Marxism and socialism in an attempt to expose and remove the oppression of women: Marxist emphasis on the exploitation of labour under capital is supplemented by Marxist feminist emphasis on the exploitation of women under patriarchy.

However, there are also forms of feminist political philosophy which are more critical of traditional political philosophy and which question the very distinctions upon which it is premised. Thus, radical feminist philosophers question the scope of the term 'political' as it is usually used by political philosophers, and argue that by excluding domestic concerns, traditional political philosophy excludes many of the things which are most important to women. The aim here is not to extend the insights of political philosophy, but rather to highlight the ways in which political philosophy itself shows a distinct gender bias.

Yet more radically, the postmodernists have been critical of philosophy's emphasis on truth and objectivity, and some feminists have extended their arguments to suggest that the very language of philosophy, and by extension of political philosophy, is 'man-made'.

Feminist political philosophy is therefore not one thing but many, and feminist political philosophers are deeply divided as to whether traditional political philosophy may be modified so as to include women's interests, or whether it is itself one of the ways in which women's politically disadvantaged position is legitimized and perpetuated.

1 The scope of feminist political philosophy

Political philosophy is primarily concerned with the justification of the state. It raises questions about what the state may demand of citizens and what citizens, in turn, owe to the state. Feminist political philosophy addresses those same concerns as they affect women. It asks whether and why there are differences between the ways in which men and women are treated by the state. Thus, in the nineteenth century, feminist political philosophers questioned the laws which dictated that men but not women were allowed to vote, and similarly they questioned the laws which prevented married women from retaining rights over their property. Here, feminist political philosophy emphasized the equality of men and women and demanded a justification for their different political and legal treatment.

More recently, feminist political philosophers have noted that even where the laws are gender neutral, women remain at a disadvantage: in most Western liberal democracies there are no longer laws which prevent women from being politically active, but nevertheless there are far fewer women than men in positions of political power or influence. This suggests that attaining full, as distinct from formal, political equality may require something more than laws which are gender neutral. As a result, feminist political philosophers have been concerned to argue for an understanding of the concept of equality which goes beyond the formal equality of gender-neutral laws (see Equality).

These two schools of thought exemplify distinct feminist approaches to political philosophy. In the first case, political philosophy's concern for equality is shown to be incompatible with laws which give women fewer political rights than men. In the second case, political philosophy's formalistic interpretation of equality is questioned. The two examples show how different forms of feminist political philosophy relate to traditional political philosophy: feminist political philosophers sometimes argue for the consistent application of the central concepts of political philosophy; sometimes for a reconsideration of those concepts.

The latter strategy manifests the more subversive character of some feminist political philosophy: traditional concern for justice and equality is often premised on a distinction between public and private life, and concern about the justice of political institutions and practices does not, in general, extend to the private world. But if political philosophy takes as its central concern the justice of political institutions, it needs to explain which institutions count as political and why. In particular, it needs to explain the grounds on which domestic affairs are deemed to be private and outside the domain of the political, outside the scope of theories of justice: for feminists, the decision to differentiate between public and private, between an area which is and an area which is not the legitimate concern of the state, is itself a political decision of some consequence (see Privacy §4). Hence the feminist claim that ‘the personal is political’, for what is meant by this is precisely that the decision as to what will and what will not count as the proper business of the state is a decision which itself has a political dimension.

Feminists who argue that the personal is political may take a further and yet more radical step, questioning the privileged position accorded to the concepts of justice and equality in traditional political philosophy. In private life, concern and compassion may be more important than justice, and if the distinction between the private world and the political world is undermined, then it seems to follow that concern and compassion should be more prominent, and justice and equality less prominent, than they usually are in political philosophy.

The views outlined above indicate that the term ‘feminist political philosophy’ covers a wide range of arguments. Some feminists argue for the consistent application of terms like ‘justice’ to women; others argue for the revision of those concepts; while yet others demand their replacement. At its most radical, feminist political philosophy is highly subversive of political philosophy, since it denies the existence of a separate, political realm or insists that the concept of the political is itself ‘male’. Nevertheless, in all its forms, feminist political philosophy seeks to identify the causes of women’s political disadvantage and to suggest remedies for it.

2 The history of feminist political philosophy

Feminist political philosophy may plausibly be said to begin in the late eighteenth century, with the publication in 1792 of Mary Wollstonecraft’s *A Vindication of the Rights of Woman* (see Wollstonecraft, M.). Wollstonecraft’s arguments owe much to Enlightenment philosophy and she champions vigorously the extension of the rights of man to women. One of her most important and controversial claims is that both men and women are essentially rational beings. Since they are alike in this respect, and since it is this which justifies the ascription of political rights, women should be accorded the same political rights as men. In its time, Wollstonecraft’s assertion that women are rational was highly controversial and had been denied by many of the great philosophers. Most importantly for her, it was denied by Rousseau, J.-J., her contemporary and one of the foremost philosophers of the Enlightenment. On Rousseau’s account, men were rational, whereas women were intuitive and emotional. *A Vindication* is in large part an attack on Rousseau’s political philosophy, and especially on its assertion that women lack the capacity for rationality.

Although it is somewhat anachronistic to refer to Mary Wollstonecraft as a feminist (the term was not used in England until 1894), *A Vindication* does nevertheless display both the critical and the constructive aims of feminist political philosophy: it exposes the ways in which traditional political philosophy excludes women and it presents a vigorous argument in favour of the extension of political rights to women.

However, Wollstonecraft also insists that, although men and women are equally rational and therefore equally entitled to be citizens of the state, they will express their citizenship in different ways. While men will occupy public positions, women will remain primarily within the private or domestic realm, and will express their citizenship in that context. Opinions differ as to the worth of Wollstonecraft’s thought in this area: some see her insistence on women’s role in the home as inappropriately conservative, while others argue that she is in fact a radical before her time, acknowledging the political importance of the domestic sphere. Whatever the correct judgment, we can see in her writings several of the most important features of feminist political philosophy: Wollstonecraft shows a keen awareness of the legal and political disadvantages which women suffered in the later eighteenth century, she identifies the cause of those disadvantages as being the belief that women and men have different natures, and she argues for the extension of political rights to women. Perhaps also she goes further, questioning the division between political and private on which political philosophy is premised, but even if she does not, her insistence on the common nature of men and women is still a central feature of feminist political philosophy and was taken up by other philosophers in the nineteenth century.

Chief among these were J.S. Mill and Harriet Taylor. Like Wollstonecraft, Mill presented an argument which was both critical and constructive. In *The Subjection of Women* (1869), he attacked those, like Rousseau, who argued that woman's political exclusion was justified by her different nature, insisting instead that women had been so repressed by social and political discrimination that it was impossible to tell what their true nature was. In so far as woman's nature appeared different from man's this was most likely to be a result of an education and upbringing which was distorting and repressive.

However, in his positive proposals, Mill appears less radical than either Mary Wollstonecraft or Harriet Taylor, who also wrote extensively on the subject of women's political position, most notably in her essay *The Enfranchisement of Women* (1851). For while Mill is eager to emphasize the fact that woman's nature has been deformed by her poor treatment, he also predicts that when women are granted equal legal and political rights with men, they will nevertheless not choose to exercise those rights in the public arena, but will prefer to remain within the home, pursuing the occupations traditionally reserved for women. And, contrary to his official position, he sometimes implies that this is because women are more emotional and intuitive than men and therefore better suited to domestic than to political occupations.

We have already seen that Mary Wollstonecraft favoured equal legal and political rights for women, yet also argued that men and women would express their citizenship differently. J.S. Mill also inveighs against women's inequality in legal and political contexts, but he sometimes implies that men and women are by nature the same, sometimes that they are different. His uncertainty about whether the differences between men and women are of political significance, and whether they spring from nature or from nurture, recur in the disputes which characterize much twentieth-century feminist political philosophy.

What is overwhelmingly clear, however, is that Wollstonecraft, Mill and Taylor set the agenda of modern feminist political philosophy. At a time when the rights of man were being declared in France and in the USA, Wollstonecraft raised the question of why those legal and political rights had not been extended to women. She argues in terms of justice and equality. Similarly, Mill and Taylor emphasize justice and equality in their discussion of women's subjection. In so doing, they provide the framework for modern liberal feminism, but it is arguable that they do more, and in some ways also anticipate the more radical forms of feminism which have become prominent in the late twentieth century.

3 Liberal feminism

The difficulties inherent in defining liberal feminism arise in part from the difficulties in defining liberalism itself, but in general we can identify the salient features of liberalism as being its individualism, its emphasis on justice and equality, and its understanding of the state ideally as a neutral arena within which people should be left to pursue their own interests in their own way (see Liberalism; Neutrality, political). For liberals, the most important function of the state is to protect individuals from interference by others. Liberalism takes as its premise the freedom and equality of all human beings and construes the state as justified in so far as it preserves that freedom and equality. Accepting these central premises, liberal feminism also emphasizes the rights of women as individuals; specifically, their right to equal treatment under the law and the responsibility of the state to ensure their freedom to develop as autonomous individuals.

Liberal feminism is primarily concerned with the legal and political rights of women and with the justice of political arrangements. Thus, members of the suffrage movement emphasized the injustice of denying the vote to women, and nineteenth-century campaigns for married women to be allowed to own property were also based on liberal premises: they appealed to the equality of men and women and to the consequent injustice of denying women the rights accorded to men.

More recently, liberal feminism has been concerned to argue for women's rights in the workplace: rights to equal pay and to equal opportunities more generally. These issues, however, raise doubts about the scope of liberalism in general, and liberal feminism in particular. The first doubt arises in connection with the individualism of liberal political philosophy: as we have seen, early liberal feminists argued for the essential sameness of men and women as rational beings. For liberal political philosophy, human beings are essentially rational creatures, and physical differences between people should not be used to justify differential treatment. Obviously, this argument was important in, for example, the Civil Rights movement in the USA. In similar vein, modern liberal feminists argue

that since women are, like men, essentially rational beings, they should be accorded all the legal and political rights of man. But in the case of women, it is far from clear that physical differences can be so easily disregarded, much less that it is just to disregard them. In this respect, it has been argued, liberal political philosophy is gendered, since it assumes the centrality of rationality and thereby ignores the important differences which spring from woman’s role as child-bearer and child-rearer. Connectedly, liberal feminism has been criticized for being altogether too willing to comply with the denial of difference and the characterization of human beings as essentially rational.

These reflections on woman’s different physical and biological nature can either inform or undermine liberal feminism and liberalism generally. Some have argued that differences can be incorporated within the liberal understanding of justice, while others have insisted that the differences cast doubt upon the very concepts of justice and equality themselves and their centrality to traditional political philosophy. Thus, Susan Okin (1990) argues that John Rawls’ theory of justice may be extended in such a way that the justice of a society is partly determined by the justice of domestic arrangements. Others have argued that the extension of justice to the domestic realm is inconsistent with central liberal principles, while yet others have cast doubt upon the importance which liberalism places on justice (see Justice §5).

4 Marxist and socialist feminism

Where liberal feminism emphasizes justice and equality and locates the source of women’s oppression in their unjustified exclusion from the political and legal rights accorded to men, Marxist and socialist feminism see women’s oppression as springing from their socio-economic condition, arguing that it will end only when social and economic circumstances change. The terms ‘Marxist feminism’ and ‘socialist feminism’ require elucidation because they are not used uniformly in the literature: sometimes they are used interchangeably, while at other times Marxist feminism is used to refer strictly to those who base their analysis on Marxist theory, and socialist feminism to refer to the more general belief that the liberation of women requires the transformation of the socio-economic system. Rather differently, socialist feminism is often used to refer to the synthesis of Marxist feminism and radical feminism. In general, however, we may take both Marxist and socialist feminism to be characterized by their belief that the causes of women’s oppression are rooted in the socio-economic system and by their proposals for remedies for that oppression - namely, the transformation of the system.

Orthodox Marxist feminism aims to extend the concepts and insights of Marx’s writings to the situation of women (see Marx, K.; Marxism, Western). In the past, this involved an understanding of women’s oppression as a special case of the quite general exploitation of workers within capitalist societies, and the remedy was to treat women’s work simply as one form of necessary labour under capitalism. This certainly seems to have been Engels’ position (see Engels). However, the analysis raises a number of problems: it is unclear whether housework should remain a ‘private’ matter, but shared equally between men and women or whether it should itself become a form of labour which attracts recompense. For many Marxist feminists, housework, or domestic labour, should not be seen as a personal service to an individual man, but as a more general presupposition of capitalism, one which is necessary if the workforce is to be reproduced. Additionally, and crucially, feminists have argued that housework is an area in which women are not merely exploited by men as capitalists, but by men as husbands. Put bluntly, Marxist feminism must account for the fact that it is not only capitalists who benefit from the oppression of women, but men generally. This argument undermines the ability of Marxist feminism to reduce all exploitation to class exploitation. For women, there is, or appears to be, a double exploitation - one rooted in class, the other rooted in gender. In consequence, there is reason to believe that women’s oppression will survive the demise of capitalism: there is no simple Marxist solution to the problem of patriarchy unless the Marxist understanding of production is extended to include reproduction.

These problems have generated a more general ‘socialist’ feminism which acknowledges the separate and distinct forms which oppression may take and which is reluctant to see all oppression as rooted in class. Here it is argued that women experience the dual oppressions of class and gender differently. Potential unities of class are disrupted by conflicts of gender (see Socialism §4).

But if this point holds, it signals not only the demise of Marxist feminism, narrowly construed, but also the possibility that different kinds of oppression will require different, and perhaps conflicting, remedies. This possibility, implicit in the denial of a single source of oppression, is problematic for feminist political philosophy

because it undermines the attempt to identify a single source of women's oppression, suggesting instead that for different women there will be multiple and conflicting sources, not easily reconcilable one with another.

5 Radical feminism

Where liberal feminism traces the oppression of women to unjust laws, and Marxist and socialist feminism traces it to socio-economic structures, radical feminism identifies the cause of women's oppression as men. It is to radical feminism that we owe the central feminist term, 'patriarchy', and the feminist slogan, 'the personal is political'. As the name implies, it is also in radical feminism that we find the most vigorous attacks on the aims and preoccupations of traditional political philosophy. For whereas liberal feminism, Marxist feminism and socialist feminism all subscribe to political philosophies which they believe can be modified to include women's interests, radical feminism is inherently critical of political philosophy itself, seeing it as one of the many ways in which male power is legitimized. On this account, socialism, Marxism and liberalism all misidentify the cause of women's oppression by interpreting it as a specific case of a more general problem. But for radical feminists, the oppression of women is a distinctive form of oppression in itself: it transcends other forms of oppression and in order to combat it women must unite as women against men as the oppressors.

From the perspective of political philosophy, the importance of radical feminism lies in its reconstruction of the concept of the political. Where liberal feminism emphasizes the injustice of existing laws, and urges the extension of the rights of man to woman, radical feminists construe the injustice of existing laws as part of an all-pervasive structure of male domination which begins in the family and spreads outward to political institutions. Hence the claim that 'the personal is political'. On this account, changes to existing laws governing divorce, property ownership and suffrage are merely cosmetic devices which conceal, and sometimes even perpetuate the injustice which exists in the structure of the family itself, and about which liberalism and liberal feminism, are largely silent. Similarly, the socialist and Marxist emphasis on the economic basis of women's oppression overlooks the important respects in which oppression may take non-economic, specifically sexual, forms. Thus, the ways in which women are disadvantaged in the workplace, and the problems associated with the status of domestic work, are but symptoms of a wider problem - the problem of women's sexual subordination to men.

But if the causes of women's oppression are as identified by radical feminists, what are the remedies? Here, radical feminists disagree profoundly: some claim that the demise of the family itself, and of women's role as child-bearers is what is required; others argue that what is needed is the re-evaluation of those roles and institutions. Expressed more generally, this is a disagreement about whether woman's biological nature is an inconvenient encumbrance obstructing her liberation, or whether it is the source of values which are currently unrecognized in politics but which, if cultivated, could provide a richer and more humane understanding of the political.

An example of the former strategy is to be found in the work of Shulamith Firestone, who argues in *The Dialectic of Sex* (1970) that the source of woman's oppression lies in her child-bearing capacity, in her 'fundamentally oppressive biological condition'. However, reproductive technology may enable woman to break free of the burden of her biology. If, therefore, women can control reproductive technology, they will, for the first time, be able to overcome oppression. Adapting Marx's arguments, Firestone argues that, like workers under capitalism, women must seize the means of (re)production with the ultimate aim of eliminating sex power and the sex distinction itself. By contrast, other radical feminists have asserted the value of reproduction and child-rearing, and have argued that women should not aspire to free themselves of those roles, but should rather emphasize the importance of the qualities which are developed through child-bearing and rearing. Thus, Sara Ruddick (1990) argues that distinctive ways of thinking may grow out of the work that mothers do. These ways of thinking are not, however, the unique preserve of women: they are developed via 'woman's work', but they are not rooted in woman's nature. They are, moreover, qualities which could have a political use in, for example, our dealings with conflict, but political philosophy's emphasis on justice and equality tends to disguise their significance.

In radical feminism, therefore, we find not so much a political philosophy as a critique of political philosophy. For this reason, radical feminism's lack of a theory of the state is not an indication that it is apolitical. On the contrary, its emphases on sexuality and child-bearing are themselves a political statement. For radical feminists, the identification of a separate, political realm is a mechanism for disguising the vast operations of power within the private world of the family. Until these latter are explained and removed, attempts to secure the liberation of

women via the 'political' methods advocated by liberal feminists, or the social and economic methods advocated by socialist and Marxist feminists, will be doomed to failure.

6 Postmodernism and feminism

In recent years, feminist political philosophy has been much influenced by the postmodernists. The term 'postmodern' covers a very wide range of thinkers, including the poststructuralists, deconstructionists, French theorists and psychoanalytic thinkers (see Postmodernism and political philosophy). However, from a feminist perspective, the important feature of all these thinkers is, as the name implies, their rejection of the modernism of Enlightenment philosophy. In the Enlightenment tradition, philosophy aims at the rational pursuit of truth, certainty and objectivity. We have already seen how some feminist philosophers reject the Enlightenment emphasis on reason and subvert traditional political philosophy by drawing attention to the 'maleness' of its central concepts. Thus, in moral and political philosophy, some radical feminists have argued that care and compassion should supplement, or even replace, justice and equality as core terms (see Feminist ethics). However, postmodernism goes further: its rejection of the Enlightenment search for truth is part of a general denial that truth or objectivity can be attained. Postmodernism is therefore at odds with both liberal feminism and Marxist feminism, since both, in their different ways, are committed to the possibility of certainty and objectivity. For postmodernists, all such commitment is itself a form of domination and therefore cannot form any part of a feminist project.

In addition, for postmodernists, the denial that there can be objective truth or certainty is often linked with an emphasis on the importance of language as a mediator between individuals and the world. Here, feminists sympathetic to postmodernism have emphasized the ways in which language itself is 'man-made' and thus constitutes a form of oppression for women. For many 'French feminists' such as Cixous and Irigary, the removal of patriarchy requires that we think as women, but thinking as a woman requires a recognition of the extent to which the language in which we think is itself man-made. The question which now arises is whether there can be such a thing as 'thinking as a woman' or whether there are simply different subjectivities and no unified category of woman.

Although postmodernism has found enthusiastic support among many feminists, it is not without difficulties. For one thing, there is an air of paradox about its confident assertion that there can be no such thing as certainty. But even ignoring that problem, postmodernism threatens to leave feminism as a rebel without a cause, for if there is no certainty or objectivity, what is the status of women's oppression? Is it also simply a feature of different subjectivities and not an objective fact? By denying the possibility of objectivity, postmodernist feminists appear to be depriving feminism of its central tenet - its claim that women as a group suffer systematic political disadvantage - and reducing it to little more than an analysis of different subjectivities. And this threatens to undermine both the possibility of, and the motivation for, feminist political action.

7 Recent feminist political philosophy

The categories of feminist political philosophy are, in part, artificial. The distinctions between socialist, Marxist and radical feminism are often blurred and controversial. Moreover, many writers resist categorization in this way - unsurprisingly, since one of the main aims of much feminist political philosophy is to indicate the ways in which the traditional branches of political philosophy themselves contribute to the oppression of women. In recent years, therefore, attention has shifted away from the distinct categories of feminist political philosophy towards the ways in which the insights of feminism, however categorized, may inform our understanding of political arrangements.

One important area here is feminist discussion of democracy and of the way in which democracy may involve a recognition of differences between people (see Democracy). In the history of political philosophy, and in the history of feminist political philosophy, individual rights have usually been asserted on the basis of the similarities between men and women. Mary Wollstonecraft, J.S. Mill and Harriet Taylor all emphasized the essential sameness of men and women as rational beings, and concluded that since women were the same as men in this respect, they should be accorded equal rights. However, the argument from sameness has its limitations. There are many important respects in which women are not the same as men, and these differences affect women's ability to make full use of their political rights, even when such rights are granted. For this reason, feminist political philosophers have turned their attention to the ways in which equality and justice between men and women may be guaranteed

through a recognition of difference, rather than through its denial or removal. One of the main proponents of this argument is the US writer, Iris Marion Young, who argues for the recognition of differences between different groups of people and for the differential treatment of those groups, in the name of fairness. Justice, she maintains, must not be interpreted as requiring abstraction from the particular circumstances of one's life (Young 1990). On the contrary, it requires a recognition and accommodation of those circumstances.

Young's argument against abstraction and universalism can, however, appear to license a special pleading at odds with an understanding of citizenship as essentially a relationship between equals. Thus, Mary Dietz argues that citizenship is about getting beyond one's immediate sphere, and dealing as a citizen with other citizens (Dietz 1985). In this respect she appears to insist upon precisely the abstraction and universalism of which Young is deeply suspicious. But the differences between them are less important than the similarities, since both insist on the importance of difference and on the need to find ways of acknowledging difference in political contexts (see Citizenship §3).

From Wollstonecraft to Dietz, feminist political philosophy has been concerned with the political significance of differences between men and women, and the ways in which those differences may be rendered compatible with political justice and equality. Often, that project has been pursued through a critique of the central concepts of political philosophy, and sometimes through a critique of political philosophy itself. In these respects, feminist political philosophy serves not only as a mechanism for drawing attention to the injustices of political arrangements as they affect women, but also as a means of revising our understanding of what political philosophy is.

Feminist theology

Feminist theology began as a reaction to the exclusion of women and women's concerns from traditional Christian theology, but it soon incorporated constructive as well as critical elements. Originating 'from the margins' of women's exclusion, it now is a major force within Christian theological thought. The issue it raised initially was the cultural and social suppositions that inform all theological thinking and that enter into theologies as 'universals'. In response to such universals, a feminist 'hermeneutic of suspicion' seeks out the hidden norms and biases within religious texts.

Feminist theology is diverse, but it is characterized by pervasive themes. Immanence is valued over transcendence, relation over substance, change over immutability, liberation over salvation, and ecological concerns over traditional Christian eschatological concerns. As could be expected from its hermeneutic of suspicion, feminist theology is also characterized by its insistence on the social location of all thinking. Feminist theologians uniformly use gender-inclusive language not only in reference to humanity, but also in reference to God. Finally, all feminist theologians manifest a concern for liberation from every type of oppression, environmental as well as social, and not just liberation from the oppression women have experienced.

1 A brief history of contemporary feminist theology

Feminist theology began modestly in April 1960 with the appearance of Valerie Saiving's article 'The Human Situation: A Feminine View'. Saiving raised a critical question concerning the work of the prominent theologian Reinhold Niebuhr. In Niebuhr's monumental *The Nature and Destiny of Man* (1941-3), he analysed sin as pride and sensuousness, with pride clearly being the greater sin. Saiving suggested that perhaps pride was the distinctive sin of men; perhaps women's experience suggested a different understanding of sin as triviality, shallowness, and a deficiency of pride, which hindered women's self-development. Although it was eight years before the first major feminist work appeared (Mary Daly's *The Church and the Second Sex* (1968)), distinctive themes of feminist theology are already apparent in Saiving's article. These are: the particularity and social location of all theology; the marginality of women within male theology; and the social framework of patriarchy as the mediator of values, and the negative effect of these values upon women. These three themes formed the matrix of feminist theology in its early years. Feminist theology was a largely critical theology, aimed at exposing the pretensions to universality and the inherent sexism of all Western Christian thought.

Feminist theology moved towards constructive thought with Mary Daly's second book, *Beyond God the Father* (1973). Daly redefined the Christian doctrines of God, humanity, sin, salvation, Christology and ecclesiology by casting them within the framework of feminist values. She rejected the traditional notion of God as Being, and developed 'God the Verb' (see God, concepts of §§1-3). Humanity was depicted as distorted by patriarchy, so that any ideal of humanity could only be developed in separation from patriarchy. Women unfolding their potential in response to the call of God the Verb were presented as the model for anthropology. Daly identified the primal sin as 'stolen energy', or men's systemic victimization of women together with the attribution of blame for this victimization to women themselves. Salvation is not through a Christ figure (for no male can save women), but through women reclaiming their energy and answering death-oriented male values with life-oriented female values. With regard to ecclesiology, Daly called for a new sisterhood of humanity governed by the vision of a community of women living in harmony with the world of animals and nature, beyond the reaches of the evil patriarchy. The work had a catalytic effect within the feminist religious community.

Two other major feminist theologians in the 1970s were Rosemary Radford Ruether and Letty Russell. Ruether's first major feminist work was *Liberation Theology* (1973), which was quickly followed by *New Woman, New Earth* (1975). In the first text, Ruether related feminist theology to the emergent liberation theologies of African-Americans and South Americans (see Liberation theology); in the second work, she developed what was to become a dominant feminist theme concerning the connections between women and the earth in patriarchal theology. The earth, like woman, becomes object to man's subject; the earth, like woman, is exploitable for man's purposes. Thus the revaluation of woman entails a revaluation of earth as well. The redemption of women and men from patriarchy will result not only in new possibilities for women, but new possibilities for the earth.

Letty Russell's work focuses upon the implications of feminist theology for the redevelopment of the Church.

Unlike Daly (and like Ruether), Russell argues that Christianity contains the seeds of its own redemption. The prophetic strain of Christianity always offers a critique of every present state of affairs, and the role of women in the present is to call Christianity to a more faithful expression of itself in communities of justice. A dominant motif for Russell is 'partnership', which signifies women and men together transforming the patriarchal Church into a newly redemptive community of wellbeing.

Daly, Ruether and Russell continued to have a major influence on feminist theology through the 1980s and into the 1990s. Following *Beyond God the Father*, however, Daly abandoned Christianity entirely and devoted her subsequent works to feminist philosophy rather than theology. Ruether's major subsequent works are *Sexism and God-talk* (1983) and *Gaia and God* (1992). In both works Ruether continues to develop her earlier themes, exploring reconceptualization of Christian doctrines, further analysing the intertwined history of sexism and the disregard of nature, and proposing a transforming synthesis of Christian notions of God with ecological notions of the earth as Gaia. Ruether maintains that only through such a reconceptualization can we address the almost irreversible destruction of the earth's biosphere that has been brought about by patriarchy.

Other major feminist voices are Rebecca Chopp, author of *The Power to Speak* (1989), and Elizabeth Johnson, author of *She Who Is* (1992). Both focus on the doctrine of God in relation to communities of justice and wellbeing, with Chopp developing the traditional language of God as 'Word' into the notion of a 'perfectly open sign' that cannot be restricted within one image. She contrasts 'Word' as perfectly open sign with the restrictive metaphor of 'father', arguing that because of the latter's patriarchal limitations, it is no longer an adequate portrayal of the God whose very being is directed towards emancipation for the oppressed.

Johnson develops a new understanding of the Trinitarian God, both drawing from the tradition and transforming it through explicitly putting feminist theology and classical theology in dialogue with one another. In the process, she shows that feminist sensitivities can illuminate much in the ancient concept of God - particularly through revision of concepts such as 'omnipotence' and 'impassivity'. She also argues that feminist theology is given increased depth through incorporating aspects of the tradition.

In the decades since Saiving's initial article, it has become apparent that feminist theology can no more be reduced to a single voice than traditional theology. Not only is feminist theology itself diverse, but it has led to such alternative modes of theology as Womanist Theology, Mujerista Theology, Asian Women's Theology and Goddess Thealogy. The first three criticize the implicit and sometimes explicit racism of feminist theologians, who are seen to speak only for white middle- or upper-class women. These modes of theology go beyond critique, however, and create constructive theology by building upon insights developed through the distinctive ethnicities of (respectively) African-American women, Hispanic/Latina women and women from the various countries in Asia. Goddess Thealogy criticizes the orientation towards God and/or Christianity of feminist theologians, claiming that Christianity, in large part by virtue of its notion of God, is the primary perpetrator of sexism and should therefore be abandoned. Despite its diversity, however, feminist theology tends to be characterized by the themes described below.

2 Feminist themes

Immanence over transcendence. Traditional theologies claim both of these categories, but the emphasis is clearly on transcendence. Feminists either retain both, but reverse the valuation, or eliminate or ignore transcendence in favour of immanence. Carter Heyward, in *The Redemption of God* (1982), falls into the latter category. For Heyward, God is wholly immanent, and is defined as the power of relationships between persons. Whether or not there is a transcendent locus to this power is irrelevant; the issue is our ability to relate to one another in constructive ways that value not only the individual but also the community. The power that generates this form of relation is also generated by this form of relation, so that, in a sense, the God who empowers relation is also strengthened by the dynamism of the resultant relations.

While Heyward comes close to collapsing the notion of God into the notion of community, other feminists, such as Mary Daly, retain the sense of transcendence in balance with immanence. Daly's naming of God moves successively from 'God the Verb' in *Beyond God the Father* to 'Goddess the Verb', the 'Unfolding Verb', 'Be-ing' and 'Meta-being' in her later works. The transcendent aspect of this 'Be-ing' functions as a power of the future. Patriarchal theologians such as Wolfhart Pannenberg also named God the power of the future, but in Daly's

treatment the deity's transcendence acts as a lure to women who are freed from, or seek to be freed from, the powers of patriarchy. This dynamic 'Be-ing' calls women into a new future; hence this divine reality transcends the present moment. As a new future, this transcendent reality is also a transformative reality, calling women into a mode of being that has never before been achieved. Thus, in its transformative mode, 'Be-ing' is immanent as well as transcendent. 'Be-ing' becomes the other side of woman's self as a kind of meta-self, or, in Daly's capitalized version, the Self. It is the transcendent 'Be-ing' of the future become immanent, empowering woman's transformation. Thus in feminist theology, transcendence becomes a temporal rather than a spatial term, and immanence becomes an inward 'otherness' that is more than the self, yet intimately connected to it.

Relation over substance. The major category of Western theology is arguably 'substance' (see Substance). Substance is that which requires nothing other than itself in order to exist, with the understanding, of course, that only God conforms perfectly to this ideal. Feminists roundly repudiate the notion of an independent substance, capable of existing apart from any relation, and argue instead that existence is itself profoundly relational. To exist is to be in relation; thus substance as that which requires nothing other than itself in order to exist is an absurdity.

The feminist value of relation over substance is not unique in late-twentieth-century theology; process theologians, who follow Alfred North Whitehead (§4), have long argued that process is reality, and that process is a dynamic movement in which every existent reality comes into being through integrating the influence of its predecessors into its own becoming (see Process theism). Feminist theologians have generally not developed the metaphysical basis of relationships; rather, they tend to assume the primacy of relationships. In many respects, the appeal is simply to women's experience. Who one is develops in and through the relationships in which one participates. Relationships can be negative when one is subsumed into subservience to another, as in the sexist attempt to 'own' another person, or relationships can be positive, as in the richness of mutual relation. But that existence is formed in and through relationships tends to function as a given in feminist theology.

Change over immutability. Traditional theology tended to attribute immutability to God and mutability to the world, with mutability being the clearly subordinate and dependent state (see Immutability). Given the feminist assertion of the primacy of relation over substance, feminists likewise value mutability over immutability. The latter is regarded as an abstraction, merely posited as the antithesis of what is considered to be universal movement, process or change.

A major implication of the feminist rejection of immutability is the redefinition of perfection. Classical theology related perfection to immutability, holding that if a subject could change, it was either better or worse than the state from which it changed; hence perfection required immutability. The feminist rejection of immutability entails a change in the understanding of perfection. In feminist hands, perfection is a dynamic condition that requires change in order continuously to manifest itself. Far from being a subordinate category, change is essential to existence.

Liberation over salvation. Traditional theology maintained that there were both historical and everlasting aspects to salvation, but feminist theologians focus almost entirely on the historical. For them, salvation is not a change of state before God, an imputed righteousness covering one's sins, or an individual affair. But since 'salvation' connotes all these things, feminists eschew the word and speak instead of 'liberation'. Far from being individualistically oriented, liberation bespeaks a transformation of the social/symbolic system of one's culture from patriarchal exclusiveness to communities of inclusive wellbeing. In *The Power to Speak*, Rebecca Chopp describes such communities as existing through 'emancipatory transformation'.

Many feminist theologians envisage such communities of liberation as already existing through para-Church organizations such as 'women-church' (Ruether 1985). These small group communities are both inside and outside the Church. Inside, they function to bring about change within congregations; outside, they function as small worship and support groups for like-minded feminists. Other feminists, such as Russell (1993), focus more clearly on the existing Church as a community of liberation, finding congregations within the Church that are willing to experiment with new modes of inclusive wellbeing. But all feminists call for transformation not only within the Church, but within society, with the aim of achieving more just and sustainable conditions of life. This is liberation, and like the symbol of 'salvation' before it, it is both the goal and the process of Christian life.

Ecology over eschatology. As implied in the preceding section, feminist concerns focus on the wellbeing of this world, both the many-cultured world of peoples and the many-splendoured world of nature. As early as the 1970s, feminists pointed out the symbolic connections between women and nature, and argued that the liberation of one entails the liberation of the other. For example, Ruether in *Gaia and God* contrasts the feminist ecological concern with Christian eschatology (see Eschatology §1). While the latter dealt in temporal as well as eternal salvation, it tended to include an end of the world, along with other-worldly redemption and spiritualized bodies. Feminist adaptation of this eschatology also speaks about an end of the world, but through human wastefulness rather than through divine judgment. The apocalypse often associated with eschatology becomes the natural disasters resulting from deforestation, ozone depletion, air, ground and water pollution, and the rapid extinction of species. This feminist adaptation of eschatology into ecology decries eschatology's depiction of the loss of this world in favour of another, calling instead for social and individual conversion in order to realize responsible, just and sustainable communities of wellbeing.

The above five themes characterize feminist theology. Emphasis and development vary, depending upon the perspective of the particular theologian. But the impact of feminist theology as a new genre within theological discourse is raising awareness of these issues within all modes of contemporary theology.

Feminist thought in Latin America

Any analysis of feminist thought in Latin America is burdened by the task of combatting the frequent assumption that feminism is an ideology imported from the USA or Europe. One could begin by arguing that in certain senses autocthonous feminist thought has existed in Latin America for centuries. The thought of Sor Juana Inés de la Cruz, a seventeenth-century Mexican writer and nun, had certain qualities, themes and perspectives that can be called feminist. Her autobiographical essay, 'Reply to Sor Filotea de la Cruz', is a brilliant defence of a woman's right to engage in intellectual pursuits and includes many feminist strategies and dimensions.

Among the Latin American feminists through the centuries, exemplary passages are easily found, such as the following from the Peruvian Flora Tristán, who said 'Without liberation of woman, there will be no liberation of man' (1843). Revisionist reappraisals of underappreciated women thinkers have grown more common. Venezuelan Teresa de la Parra's important writings which have been re-examined as texts by women continue to be rescued from relative obscurity. Rosario Castellanos, Rigoberta Menchú and Domitila Barrios de Chungara count among those whose work has enjoyed increased critical attention. Concurrently, the voices of traditionally voiceless women are being heard through expanding oral history projects, such as those of domestic workers in Bogotá: 'It is not enough to have rights. We must raise consciousness and organize ourselves to defend those rights'.

In recent years, particularly after the international year of the woman in 1975 and the decade of the woman sponsored by the United Nations from 1976 to 1985, women and men have continued to develop feminist philosophies appropriate for Latin American contexts.

Professional feminist philosophy has been practised in Latin America since the early part of the twentieth century. Perhaps surprisingly, a theoretically sophisticated feminist philosophy was practised in Uruguay at this time by male social philosopher, Carlos Vaz Ferreira (1871-1958). His work had significant impact on women's rights in Latin America. Vaz Ferreira was a pioneer in feminist theory.

1 The early twentieth century: Carlos Vaz Ferreira

The ideas of this seminal Latin American social thinker and his thought-provoking study of gender and family have stood the test of time since they were first delivered in Uruguay in 1914. *Sobre feminismo (On Feminism)* (1933) was written between 1914 and 1922 in the form of lectures which were delivered at the University of Montevideo where Vaz Ferreira was an academic. The book is concerned primarily with examining 'factual' differences between the sexes and 'normative' issues, such as the political, civil rights, their social life and the organization of the family within society. Vaz Ferreira analyses the disproportion between the ideas and faculties of women and the scope which society allows to their activity. He advocates the right of women to participate in all that makes life valuable to the individual human being. The ideas he expresses in *Sobre feminismo (On Feminism)* are poignant, relevant and innovative in the light of contemporary social debates throughout the Americas.

Sobre feminismo (On Feminism) is the Latin American counterpart of John Stuart Mill's *The Subjection of Women* (1869) in terms of content and tone, and more importantly, its impact on elite thinking. *Sobre feminismo (On Feminism)*, however, reflects the social changes that could be expected more than fifty years later. Vaz Ferreira's early influence on the suffrage movement was significant and his contributions are particularly noteworthy given that in general Hispanic men of his culture and age were not renowned for their progressive attitudes towards women. In Latin American intellectual circles in the early part of the twentieth century, an effect of the pervasive *machismo* and its complementary femininity was to marginalize women so thoroughly that thought about gender and family roles only had widespread impact when expressed by powerful men.

As one of Latin America's most influential social philosophers in the early twentieth century, Vaz Ferreira's complete works were collected in twenty-five volumes (1957-63). *Sobre feminismo (On Feminism)*, set within the Latin American experience, presents cogent arguments against the marginalization of women, the infringement of their political rights and their second-class status in marriage. Vaz Ferreira outlined a theory of cooperation between men and women which privileged monogamy, the family and the equitable division of household tasks. He studied the ways in which pregnancy can be a disadvantage for women and suggested remedies to compensate

for what he viewed as biological inequity. Ahead of his time, Vaz Ferreira reflected on divorce, artificial insemination and abortion. He was a painstaking, self-consciously philosophical craftsman who clearly grappled with what evidence he could muster to support what was essentially cultural and social criticism of the intimate dealings of men and women. He was avid in avoiding contradiction so as to insist on a certain philosophical probity which was not expected in Latin American discourses on women's roles at that time. Because of this insistence, he was considered a model of anthropologically-sensitive social philosophy.

The first print-run of *Sobre feminismo (On Feminism)* (1933) coincided with the year in which Uruguayan women's suffrage was enacted. Since Uruguay was one of the first Latin American countries in which women's suffrage was achieved, the lengthy gestation period and public lectures which led to its publication reveal both its timeliness within Uruguayan society and Vaz Ferreira's role as an influential public thinker.

These dates are historically significant because they show that serious feminist thought has been going on in Latin America since the early part of the twentieth century. However, the theories of Vaz Ferreira have not received the critical attention they deserve. *Sobre feminismo (On Feminism)* is still a relatively unknown work, while European and North American analyses of feminism remain privileged and widely disseminated. One distinguishing feature of Vaz Ferreira's work is that it includes analysis of justice for women within the context of the family while many contemporary theories of justice omit consideration of women in families (see Family, ethics and the; Justice).

Sobre feminismo (On Feminism) is an analysis of the social situation of the woman 'of flesh and bone' in the context of 'feminism' and 'antifeminism'. In Vaz Ferreira's words, 'those terms "feminism" and "antifeminism", "feminist" and ''antifeminist", in reality, do more harm than good, and they complicate the many and sometimes enormous difficulties of the problems: they complicate them further with questions of words and with confusions derived from the words' (1933: 14). He believed that a false polarization is produced by the terms 'feminism' and 'antifeminism' because there are those who believe 'we are the true feminists because we want to preserve the distinctive traits of the female sex. You want to make men of women; your true name ought to be ''hominists" and not "feminists"' (1933: 17). In Vaz Ferreira's view, the issues are neither so polarized nor so simple and this kind of resentment impedes serious analysis of the situation in which modern woman finds herself. Nevertheless, considering the various connotations implicit in the term 'feminism', contemporaries run the risk of being misunderstood when calling themselves 'feminist'. Vaz Ferreira recognized the importance of clarifying language usage and tried to extract concrete meanings when discussing feminism.

He felt the best strategy for confronting the problem of the social situation of women is to examine, on the one hand, the possible questions relating to the similarities and differences between the two sexes and, on the other, examine normative problems. Vaz Ferreira distinguished factual questions from normative ones in *Lógica viva (Living Logic)* (1910). Such factual questions relate to knowledge and verification and the normative questions relate to action, preference and choice. The latter are most relevant in terms of the female condition.

Among the questions of similarities and differences between the sexes, Vaz Ferreira maintains that there are debatable and undebatable data. The important undebatable fact, radical for his time is: 'From the union between a man and a woman, the woman can become pregnant; nothing happens to the man'. He argued that, 'finding this fact to be satisfactory is to be ''antifeminist"' (1933: 25). The factual data are of three types: biological, physiological and psychological. A recurring debate is that of 'the comparative intelligence of the two sexes, a special case in the category of comparative psychology' (1933: 12). However, in his treatment of the intelligence and mental aptitudes of women, Vaz Ferreira takes seriously the possibility that it could be verifiable that women might be less intelligent than men as he ponders why there have been no female Beethovens or Darwins, for example. This is the weakest point in his argument and one of the rare occasions when he fails to take socialization into account when trying to explain differences between social groups and their roles.

More convincing is his treatment of normative problems in *Sobre feminismo (On Feminism)* (1933). The normative problems for Vaz Ferreira are women's political rights, their activity in society, their access to public office, careers, professions and education; civil rights, the relations between the sexes and the organization of the family.

The basic idea in his analysis of these problems is to maintain the difference between 'feminism of equality' and 'feminism of compensation'. The former, according to Vaz Ferreira, is based on the idea that 'jobs and careers should be open to women as they are to men; that women should have the same civil capacity as men, the same

level of education; that, in general, the sexes should be equalized by diminishing the difference between them and by placing women in the same situation as men, making them more like men' (1933: 16). For him, 'feminism of equality' does not merit much attention because of the mere fact that women are biologically mistreated by the likelihood of pregnancy in their unions with men and therefore it is not possible to speak of 'equalization'. The only acceptable feminism to Vaz Ferreira is that of 'compensation', based on the idea that it is necessary to compensate physiological injustice given that it will never be possible to equalize it and that it would be counterproductive to attempt to do so. Thus, 'Antifeminism takes as its guide that fact (women's biological disadvantage). Bad feminism does not even take it into account. Good feminism strives to correct it and compensate for it' (1933: 38).

With respect to the civil and political rights and social participation of women, Vaz Ferreira had a decisive impact in favour of women in the Uruguayan legislature. Suffrage in Uruguay was enacted in 1933, following the USA (1920) and Ecuador (1929). Vaz Ferreira also proposed a bill, the law of unilateral divorce, which passed into law in the form he had conceived it. The law gave women the power to obtain a divorce at will 'without giving cause, while men have to show just cause' (1933: 83). This law is consistent with his theory that the situations of men and women are fundamentally different. When the law was passed, 'opponents of divorce did not like it because of their need to preserve the family as the basis of society. Proponents of the right to a divorce did not like it either because they framed the question as one of "equality"' (1933: 83). Vaz Ferreira's position can be criticized as a case of reverse sexism in which men do not have the same rights as women. It can also be placed in the context of his theory of 'feminism of compensation' in the way he seems to propose replacing patriarchy with matriarchy to correct historical inequities. To some extent Vaz Ferreira also believed that matriarchy deserved a turn in beginning the long process of compensation.

The normative problem which most concerned Vaz Ferreira was that of relations between the sexes and the organization of the family. His analysis of marriage and divorce was a curious mix of obsolete and progressive ideas. He asserted that roles outside the home are for men and those inside the home are for women; that it is possible that women are less intelligent than men because most great cultural figures are men and that 'free love' is a destructive social force.

At the same time, Vaz Ferreira was a pioneer of feminist ideas which became widespread much later. For example, although he believed that relationships are ideally constituted as monogamous marriages, he also indentified marriage as an institution which unfairly regulates and limits the role of women both in professions and as part of a workforce, and therefore needed modification. Vaz Ferreira wrote, 'A woman's capacity to live for herself, which has to do with power, ability, and opportunity, should not depend wholly on marriage, as it seems to in mainstream society, which is one of the saddest and most unpleasant aspects of traditional society' (1933). He also criticized the arguments of opponents of divorce who 'reason as if those who support the right to a divorce maintained that divorce is a good' (1933: 81). He believed that it was unfair that women have been expected to change their names when they marry while men do not modify theirs. He asked: 'Isn't this a relic of antiquated social structures in which the man owned the woman, or she was subordinate to him?' (1933: 141).

2 Recent trends

Women's suffrage did not immediately translate into social change. After 1933, although suffrage spread throughout Latin America, with Paraguay being the last country to enact it in 1961, philosophy continued to be practised almost exclusively by men. However, feminist concerns sometimes arose tangentially in other philosophical discussions. The Mexican philosopher Leopoldo Zea (1912-) focused on women, indigenous peoples and children as early as 1952 in his analyses of marginality (see Marginality; Mexico, philosophy in). Similarly, theories of liberation often selfconsciously advocated the rights of women (see Liberation philosophy).

Since the 1980s Latin American women have entered the academy in greater numbers, many of whom have become actively engaged in feminist philosophy in addition to other philosophical areas of expertise. Scholars of literature and the social sciences have increasingly drawn philosophers into their debates about feminist theory. There has been an increase in the number of feminist conferences, books and journals, most notably in Mexico and Argentina, as well as throughout Latin America. *Fem* (1975-) and *Debate feminista* (1988-) are journals of feminist thought published in Mexico. *Feminaria* has been published in Argentina since 1988.

One of the key points of debate among feminist thinkers has centred on the primordial nature of gender and class. While some have maintained a traditional socialist idea that women must work towards justice with men rather than emphasize differences between men and women, others have argued that patriarchy must be subverted before there can exist a society unconstrained by divisions of gender. Thus, the former believe that class is primordial, while the latter privilege gender-based social order in their analyses.

Feminist thought in Latin America can be differentiated from many of its North American and European counterparts by an almost ever-present concern for the family and certain forms of Latin social life and relationships. Although alternative lifestyles do exist among women in Latin America, feminist philosophy has commonly attempted to end discrimination against women while simultaneously accepting the family as the fundamental social unit. Many translations of North American and European feminist thought are published in Latin America and read widely, despite the fact that their emphasis on the individual rather than the family is not easily adapted to Latin American contexts and is often seized on as evidence of fundamental cultural difference.

Feminist thought in Latin America continues to focus on the pressing concerns of Latin American societies first, without necessarily concerning itself with questions of its applicability to other regions of the world. Rather than being a separatist movement, feminist thought is often well-served by connections forged with other areas of contemporary thought in Latin America, such as the development of democracy, equality and socialism, religious and secular ethics and liberation philosophy.

Ferguson, Adam (1723-1815)

Rarely mentioned by philosophers except as companion of David Hume and Adam Smith, Ferguson contributed a political consciousness to the moral philosophy of eighteenth-century Scotland. In An Essay on the History of Civil Society (1767), Ferguson used a comparative method to reflect on a commercial society distinguished by refined division of labour and to caution against its political dangers. With his intentionally elevated rhetoric he sought to counter his philosophical contemporaries' analytical aloofness from the negative effects of the civility, commerce, security and critical philosophy they prized. Ferguson's textbooks and Roman history deserve philosophical attention for their help with interpreting his distinctive social diagnosis of the liberal political constitution.

Ferguson's Highlands birth and Gaelic made him unique among the figures prominent in the 'Scottish Enlightenment' (see Enlightenment, Scottish), but he was unexceptionably Whig in politics and Moderate in Church affairs. Born 1723 in Logierait near Perth, Ferguson moved to Edinburgh for divinity studies after an MA from the then provincial St Andrews. An intimate of the circle around David Hume, he early abandoned a clerical career. Ferguson served five years as professor of natural philosophy in the University of Edinburgh, thanks to political patrons of the literary set, and then, in 1765, began a popular twenty years as professor of pneumatics and moral philosophy. The professorial position was more didactic than scholarly, as was clear from Ferguson's effectiveness in the science chair; but Ferguson's *Essay on the History of Civil Society* (1767) gained him recognition beyond the lecture room and salon. There were French and German translations, and attention from philosophers on the Continent. In addition to four pamphlets on political controversies, Ferguson published two textbooks for his course, the second a retrospective work, in which he systematized the changes he made during his years of teaching and a long-standard, but largely derivative, *History of the Progress and Termination of the Roman Republic* (1785). He died in 1815. His books were staples of instruction in American colleges well into the nineteenth century.

Neither Hume nor Adam Smith was impressed by Ferguson as a theorist. Philosophers have left his work to on the one hand intellectual historians, who find there the epitome of republican misgivings - perhaps conditioned by a pre-Romantic Highlands sensibility - about the Scottish race to modernity after the Jacobite Rising of 1745, and on the other hand to sociologists, who honour Ferguson as a science-minded progenitor of sociological theories of modernity. With his invocation of classical models and his alarms against corruption in nations dedicated to individual gain rather than heroic action, Ferguson amplifies the discourse of 'civic humanism' or 'Machiavellian moralism', as many historians emphasize; but he also fits in with a wider class of didactic rhetoricians who sought to bolster a religiously latitudinarian moral community in eighteenth-century Scotland. Sociologists' claims to Ferguson are no less justified, first and especially by Ferguson's insistence that the study of human nature is an empirical study of humans in civil societies differing in design from one developmental stage to another, and second by his conjectural reconstruction of these designs to recognize not only political, economic and ideological differences, in the manner of Montesquieu, but also sociological mechanisms such as integration through conflict, stratification, and diverse forms of sociation. Karl Marx's incidental commendation of Ferguson as a materialist thinker with original insights into the harm done to workers by a refined division of labour (see Marx, K.) stimulated a tradition of commentary that emphasizes - and exaggerates - the extent to which Ferguson first identifies each historical period with a distinctive mode of subsistence, second, rationalizes the respective schemes of stratification, property, mentality, political formation by reference to this feature, and, third, identifies a potentially explosive tension in the latest stage - a commercial society whose political order is progressively undermined by its own socioeconomic arrangements.

Although modest about the originality and rigour of his efforts, Ferguson counted himself a participant in the philosophical debates of his time and, indeed, as Adam Smith's competitor in addressing what George Davie calls 'the central problem of Scottish philosophy', namely, reconciling material advance with traditional moral standards in a 'teachable philosophy of civilization' (Davie 1976). Viewed from this perspective, Ferguson's writings appear as exercises in complementarity, in which their author is seeking a reasonable strategy for co-ordinating two distinct modes of reflection. On one side is an analytical model of the progressive development of the human species through a sequence of stages in the history of civil society, with each stage conceived as a configuration of diversely formed productive, legal, moral, intellectual and hierarchical relations, some more

systematic than others. On the other side is the evocation of a practical capacity to act in the diverse historical contexts, with the quality of actions assessed by standards of active virtue, especially manifest in political practice.

Ferguson submits the first level of study to Newtonian rules of method, in principle; and his work often varies themes from Hume and Smith. The second type of knowledge he distinguishes from the first as the knowledge appropriate to actors, not spectators; and he attacks Smith for neglecting this dimension and for allowing moral psychology or economic laws to stand in for responsible decisions. Moral conduct is opaque without a science of the facts of human existence, but incoherent without practical understanding. Historical stages constitute scenes for actions subject to principles derived from a practical philosophy of elevated happiness. Political arrangements express modes of action designed to counter the negative effects of adventitious social circumstances. The essay form bypasses philosophical difficulties in interrelating these levels, but Ferguson's experiment gains in philosophical seriousness from his astute reflection on literary forms like the essay.

In his moral philosophy class, as documented in the *Institutes of Moral Philosophy* (1768) and the retrospective *Principles of Moral and Political Science* (1792), Ferguson grounded the 'history of the species' in a psychological theory of the individual, and elaborated a distinction between explanatory and normative theories. Although his decisive construct, of 'man's progressive nature', has the wobble of improvisation, the effort to constitute a structured connection between the distinct domains marks an advance in the literature of Common Sense responses (see Common Sense School) to Hume. Put in the context of his view of constitutions as imperfect syntheses of conflicts, Ferguson's designs are suggestive for a period of philosophical experimentation.

Ferrier, James Frederick (1806-64)

Ferrier represents the transition within nineteenth-century Scottish philosophy from the tradition of common-sense realism begun by Thomas Reid, the last major exponent of which was Ferrier's mentor, Sir William Hamilton, to versions of idealism influenced by German philosophers, especially Hegel. Although he is largely forgotten, Ferrier merits study for at least two reasons. First, he had a role in importing Hegelian ideas into British thought; and second there are parallels between his arguments and those advanced by antirealist philosophers in the analytical tradition.

Ferrier was born in Edinburgh into a Scottish legal family. He studied at Edinburgh University (1825-7) and at Magdalen College, Oxford (1828-32), then began a short-lived legal career before turning to writing. In 1834 he toured Germany and in Berlin was taken with the ideas and cultural influence of Hegel who had died there three years previously. In 1837 Ferrier married and around that time began writing and publishing philosophical work. His first and most accessible publication was 'An Introduction to the Philosophy of Consciousness' which appeared in seven parts in *Blackwood's Magazine* during 1838-9. Subsequent works included 'Berkeley and Idealism' (1842); his *magnum opus*, the *Institutes of Metaphysics* (1854); and 'Scottish Philosophy, the Old and the New' (1856). Further material was published posthumously, such as the 'Lectures on Greek Philosophy' (1875) and 'Criticism of Adam Smith's Ethical System' (1986). Ferrier began his academic career as Professor of Civil History at Edinburgh (1842-6) but failed in his efforts to succeed Sir William Hamilton (1791-1856) in the Chair of Logic and Metaphysics there. In 1845, however, he was appointed Professor of Moral Philosophy at St Andrews, where he remained until his death.

Although much indebted to the teaching and writings of William Hamilton, who had edited the works of Thomas Reid, the 'father' of the Scottish 'common sense' tradition, Ferrier rejected the doctrines and methods of the 'Scottish Philosophy', as that tradition had come to be titled (see Common Sense School). In an effort to refute Humean scepticism,Reid and his followers had argued that in cognition the mind is directly engaged with reality and not with mental intermediaries such as 'impressions' or 'ideas'. This cognitive power was taken to be a constitutive feature of the human mind, and the study of it and of other mental faculties had come to be a major focus of interest for Reid's realist contemporaries and successors, who sought thereby to develop a 'Science of the Human Mind'.

As this study became more empirical a new form of scepticism began to emerge, since it was realized that all the method could reveal is how things appear to consciousness. Given a different empirical constitution, however, it might be that a subject's experiences would be quite unlike those taken to be common among human beings as they actually are. The resulting conception of the 'Relativity of Knowledge', as it came to be called, also drew upon Kantian themes which suggested the possibility that we are not even acquainted with the world and the self as they are *in themselves*, but only with subjectively conditioned *appearances*. Ironically, then, by the time of Hamilton, the anti-sceptical realist tradition initiated by Reid had come to the point of finding our knowledge of self and of reality problematic.

Ferrier's rejection of this tradition was due in part to its tendency to generate scepticism, which he judged to be ultimately incoherent, but also to what he saw as its disastrous substitution of empirical psychology for a priori reasoning. Following in the tradition of the Rationalists, in particular Descartes, Ferrier sought to show that philosophy is able to determine the necessary limits and structure of reality, showing what can and must be so and not restricting itself to what contingently exists. In the *Institutes of Metaphysics* he even goes as far as to claim that his entire philosophical system, comprised of 'epistemology' (a term of which Ferrier was the author), 'agniology' and 'ontology' (the theories of knowledge, ignorance and being, respectively) is derivable by deduction from the law of identity: 'that a thing must be what it is. A is A'.

Ferrier's charge against his predecessors is related to the objection made by later writers to the psychologizing of logical reasoning. One aspect of this is his observation that empirical study is incapable of refuting philosophical arguments such as those taken to imply scepticism. His own response to the sceptic is unmistakably aprioristic, involving the claim that epistemological and metaphysical relations between the subject of cognition, the act of cognitive consciousness and the object of cognition are internal or non-contingent. All 'subjects' and all

‘objects’ are, as such, necessarily terms of actual or possible cognitive relations. Even ignorance ensures the possibility of knowledge inasmuch as one can only fail to know that which can be known. Thus, anticipating arguments of later phenomenologists and antirealists, he concluded that the idea that reality might in principle transcend our capacity to know it is an incoherent one: the real is the knowable.

Among his contemporaries, other than those within the sphere of his immediate influence in Edinburgh and St Andrews, Ferrier’s idealist system was not well-received. Those who knew his work recognized his ability but were unpersuaded by his doctrines. In part that was probably due to the fact that the temper of the period was increasingly one of empiricism and naturalism, approaches opposed to that of a priori metaphysics. Set against this, however, there are interesting parallels between aspects of Ferrier’s philosophical system and ideas developed within analytical philosophy by writers such asMichael Dummett andHilary Putnam, concerning the extent to which ‘reality’ is a function of our ways of thinking, (see Realism and antirealism), and there is certainly scope for useful scholarship exploring these points of similarity. Indeed, the time is overdue for a proper assessment of Ferrier’s philosophical contribution.

Davie, G. (1967) ‘J. Ferrier’, in *Encyclopedia of Philosophy*, ed. P. Edwards, New York: Macmillan.(A brief account of Ferrier’s life and work emphasizing the interest of Ferrier’s earlier ‘phenomenological’ writings.)

Haldane, E. (1899) *James Frederick Ferrier*, Edinburgh: Oliphant.(Notwithstanding a more recent study by Thomson (see below), this remains the most comprehensive and reliable introduction to Ferrier’s life and work.)

Mayo, B. (1969) *The Moral and Physical Order: A Reappraisal of James Frederick Ferrier*, St Andrews: University of St Andrews.(A short but interesting discussion of aspects of Ferrier’s epistemology and moral psychology which argues that they anticipate ideas associated with twentieth-century analytical philosophy).

Thomson, A. (1964) ‘The Philosophy of J.F. Ferrier’, *Philosophy* 39: 46-62.(An account of Ferrier’s thought, as presented in the ‘Introduction to the Philosophy of Consciousness’, which holds that among Scottish philosophers he is second only to Hume in the originality and value of his ideas.)

Thomson, A. (1985) *Ferrier of St Andrews: An Academic Tragedy*, Edinburgh: Scottish Academic Press.(Although much more detailed in biographical aspects thanHaldane (1899), like Thompson’s *Philosophy* article (1964) this exaggerates Ferrier’s philosophical importance. It also makes controversial claims concerning his private life.)

Feuerbach, Ludwig Andreas (1804-72)

Ludwig Feuerbach, one of the critical Young Hegelian intellectuals of the nineteenth century, has become famous for his radical critique of religious belief. In Das Wesen des Christentums (Essence of Christianity) (1841) he develops the idea that God does not exist in reality but as a human projection only, and that the Christian principles of love and solidarity should be applied directly to fellow humans rather than being regarded as an indirect reflection of God's love. In religion, the believer 'projects his being into objectivity, and then again makes himself an object of an object, another being than himself'. Religious orientation is an illusion and is unhealthy, as it deprives and alienates the believer from true autonomy, virtue and community, 'for even love, in itself the deepest, truest emotion, becomes by means of religiousness merely ostensible, illusory, since religious love gives itself to man only for God's sake, so that it is given only in appearance to man, but in reality to God' (Feuerbach 1841: 44, 48). In Grundsätze der Philosophie der Zukunft (Principles of the Philosophy of the Future) (1843) he extends his criticism to all forms of metaphysics and religion: 'True Dialectics is not the Monologue of the sole Thinker, rather the Dialogue between I and Thou', he writes in paragraph 62 (1846-66 II: 345), criticizing in particular his former teacher Hegel. The philosophy of the future has to be both sensual and communal, equally based on theory and practice and among individuals. In an anonymous encyclopedia article (1847) he defines his position: 'the principle from which Feuerbach derives everything and towards which he targets everything is "the human being on the ground and foundation of nature"', a principle which 'bases truth on sensuous experience and thus replaces previous particular and abstract philosophical and religious principles' (1964- III: 331). Feuerbach's sensualism and communalism had great influence on the young Karl Marx's development of an anthropological humanism, and on his contemporaries in providing a cultural and moral system of reference for humanism outside of religious orientation and rationalistic psychology. In the twentieth century, Feuerbach influenced existential theology (Martin Buber, Karl Barth) as well as existentialist and phenomenological thought.

1 Philosophy of the I and the Thou

Born in Landshut, son of the legal scholar and Bavarian diplomat Anselm von Feuerbach, Ludwig Andreas Feuerbach studied theology with Karl Daub in Heidelberg and philosophy with Hegel in Berlin. He became lecturer in philosophy at the Bavarian university of Erlangen in 1829, but retired into private life after his marriage in 1837. His later years were without much communication and social activities; he died a poor and sick man in Rechenberg, near Nuremberg.

The interaction between the individual and the worlds of facts and thought, and the interrelatedness of individuals, were the central topics in Feuerbach's thinking. His dissertation *De infinitate, unitate atque communitate rationis (On the Infinity, Unity and Universality of Reason)* (1828) concerns the relationship between the individual and the general, the subjective and the objective; here his answer is that panlogic rationality is the universal individual as well as the general mode of essence and existence. Two years later he published his fiercest critique of Christian belief in immortality and eternal life after death in *Gedanken über Tod und Unsterblichkeit (Thoughts on Death and Immortality)* (1830). Here he holds that the mystical experience of sensual love and interpersonal community has infinity and eternity in itself, and that the neglect of this world and its riches in favour of the anticipated eternal world to come causes unhappiness and great discontent. Both studies mark two different attempts at a non-religious, humanistic transformation of traditional mystical insights concerning the unity of object and subject into, first, panlogical rationalism and, second, sensualistic realism. The publication of the critique of immortality, even though it appeared anonymously, made it impossible for Feuerbach to get a permanent salaried position as professor of philosophy in Christian Bavaria; he quit his teaching post after nine years of only moderately successful academic teaching at the University of Erlangen.

Feuerbach's existentialist concept of philosophy is explicated in *Abelard and Heloise* (1834) and *Pierre Bayle* (1838), as well as in his selected studies on Spinoza and Leibniz. In *Grundsätze der Philosophie der Zukunft* (*Principles of the Philosophy of Future*) (1843) he asserts that the philosophy of the future is 'the complete, coherent, and absolute resolution of theology into anthropology', into the 'unity of the I and the Thou': 'The essence of man is contained only in community, in the unity of man with man - a unity which however is founded only in the reality of the differences between I and Thou'. Thus, the new philosophy 'replaces religion… contains the essence of religion… truly is religion'. Epistemologically, reality resides in human rational and sensuous

perception, in the rational, sensuous and passionate nature of man; 'Truth, reality, and sensation are identical. Only the sensuous being is a true and real being' (Feuerbach 1846-66 II: 344, 346). In critically reconstructing the history of religious systems of reference, Feuerbach finds in references to God the believers' complex reference to themselves. Thus his method of critical reconstruction of previous systems of reference and self-reference reveals, as Wartofsky (1977) observes, a mode of self-revelation and self-articulation which represents the essential pattern of human consciousness and self-understanding, a consequent application of the existentialist interpretation of Hegel's *Phenomenology of Spirit* in Feuerbach's anthropological interpretation: 'the true critique lies in the development itself'.

This unorthodox approach to traditional metaphysics and anthropology influenced twentieth-century theologians and philosophers such as Martin Buber, Karl Barth, Karl Loewith, Henri Arvon and Louis Althusser. Feuerbach's influence on the young Marx also played an important role in the post-Leninist interpretation of the humanism of the young Marx as an alternative to Marxism-Leninism and Stalinist interpretation of political economy.

In his last period in *Über Spiritualismus und Materialismus (On Spiritualism and Materialism)* (1866) Feuerbach developed an eudaimonistic and utilitarian ethics on the basis of the I-Thou anthropology, and a critique of perverted forms of seeking happiness and community in religion: 'Good is the acceptance, bad the rejection of the drive to happiness. Happiness, but not reduced into one single person, rather disseminated among different persons, I and Thou integrating, therefore not one-sided but dual-sided and all-sided, is the principle of morality'. Sexual happiness is his paradigm for 'the human drive to happiness, which can only be fulfilled in and through the happiness of the other' (Feuerbach 1846-66 X: 62). The individual moral conscience thus works on the basis of reciprocity in assessing moral norms and attitudes: 'The conscience is nothing else than the I which looks at things from the perspective of the vulnerable Thou, nothing else than the proxy for the happiness of the other on the basis and on the calling of one's own happiness' (Feuerbach 1846-66 X: 65).

2 Critique of religion

Feuerbach's humanist approach prevented his philosophy of religion from merely rejecting religion as unrealistic and unfounded. On the contrary, he believed that religion contains the dreams and visions of individuals and cultures in an indirect way, a human product of self-transcending and visualizing oneself and humanity in ideal terms, not a divine inspiration: religion is the 'knowledge of the infinite, it is therefore and can be nothing else than the consciousness which man has of his own - not finite and limited - but infinite nature' (Feuerbach 1846-66 VII: 26). Feuerbach therefore rejects the notion that he is a promoter of atheism; he calls himself 'a natural philosopher in the domain of the mind', an 'anthropocentric' thinker: 'the mystery of theology is anthropology, that of the divine being the human being' (Feuerbach 1846-66 V: xiv-xv). This was exactly the interpretation of religion used by Hegel to interpret Greek and Roman mythology and religion as centred around the human world and simply transposing human characters, virtues and vices into the gods and goddesses. While Hegel's main interest in the philosophy of religion was dialectically and speculatively to harmonize Christian tradition with speculative idealism, for Feuerbach all religious references are models of 'alienation' of man from himself, as God is nothing else but the artificially created outside nature of man's own inside nature (see Alienation §2). Feuerbach rejects religion to the extent that it separates God and humans, and deprives humans of their best by making them a part of the divine; but he accepts religion to the extent that it recognizes divine powers and challenges which are genuinely human.

Feuerbach originally intended to entitle *Das Wesen des Christentums* (*Essence of Christianity*) (1841) as 'Critique of Pure Unreason' in order to set it alongside Kant's *Critique of Pure Reason*; and indeed the composition of his book mirrors that of Kant. Its first part characterizes religion as a human product and its positive content (that is, the 'true and anthropological essence of religion' which understands God as 'love' in the New Testament or as 'a moral being or law' in the Old Testament), just as Kant in the first part of the *Critique of Pure Reason* develops the positive capacities of epistemology in his transcendental analytics and aesthetics. The second part deconstructs religious speculation and metaphysics as being unrealistic and inhuman (that is, 'the false or theological essence of religion'), just as Kant destroys the arguments for metaphysics and the existence of God independently of human projection and existence (see Kant, I. §8). Thus, in making Christian monotheism his predominant object of critique, he presents an anthropological reduction of what in Hegel's interpretation still had

the form of speculative transcendentalism. The human being is not a bearer of reason, subordinated to as well as participating in the 'idea', but a natural being existing in relationship with others. The revised second edition (1843) moves away from the dominance of the 'species being' model of human religious projection and alienation, which was still strongly influenced by Hegel, towards a more naturalistic sensualistic approach under the influence of reading Luther.

Later, in a short essay on the nature of religion, *Das Wesen der Religion (Essence of Religion)* (1845), Feuerbach additionally identifies angst and fear of unknown natural elements as the prime sources of religious projection. This generalizes his earlier theory into the explanation of religion as a response to social as well as natural environmental challenges based in feelings of dependence of and exposure to nature: 'man's original dependence and the feelings of dependency relates to nothing else than nature'; therefore, '"spirit" is nothing other than a general term to name essences, things, utensils which man is confronted with and which are different to his own products, he also uses the collective term "nature"' (Feuerbach 1964- X: 4).

In his widely read *Vorlesungen über das Wesen der Religion (Lectures on the Essence of Religion)* (1851), originally delivered publicly in the revolutionary year 1848 on the invitation of students and citizens of Heidelberg, Feuerbach describes the cultural and social implications and consequences of religion and belief. Here, as in the *Essence of Religion*, the true object of religion and religious self-articulation or alienation is not primarily the individual and the social environment, but nature all-encompassing, the sum of powers and forces on which the individual feels absolutely dependent while simultaneously seeking freedom and self-determination.

His final exercise in promoting the thesis that 'man created God' is the voluminous book *Der Ursprung der Götter nach den Quellen des classischen, hebräischen und christlichen Altertums (Theogony following the Sources of the Classical, Hebrew, and Christian Past)*, written between 1852 and 1857, with an even greater arsenal of quotes and references from a broad variety of religious literature. Different forms of religion demonstrate different attitudes of humans towards themselves and towards nature. While polytheism expresses the subordination of man under a multitude of external powers in nature, monotheism suppresses those many forces and powers in nature under one single rule or ruler, indirectly under man, who has created this divine supreme power after his own human image.

It is this analytical and educational drive to 'transform friends of God into friends of man, believers into thinkers, devotees of prayer into devotees of work, candidates for the hereafter into students of this world' and the I-and-Thou which became instrumental in shaping modern existentialist theology, both Jewish (Martin Buber) and Protestant (Karl Barth). Despite being religious believers, Buber and Barth were nevertheless struck by Feuerbach's suggestion that all previous forms of theology and dogmatics, including Hegel's philosophy of religion, were nothing other than 'esoteric psychology', and they themselves became critics of religious fundamentalism. Most of Feuerbach's theological critics agree that the importance of religion as a mode of reference to oneself, to others and to the social and natural world rarely has been grasped as comprehensively as it was by Feuerbach.

3 Individual emancipation versus political revolution

Feuerbach refused to accompany Marx, Ruge and other political revolutionaries and liberals into the course of direct political argumentation and action. He held that the time was not yet right for a political revolution because individual emancipation and the development of a culture of self-determination had not run its course in Germany. Therefore he chose the emancipatory and educative approach, analysing and criticizing traditional models of orientation in religion, philosophy and ideology in order to promote political change by promoting self-understanding and self-determination based on the principles of enlightenment. Contrasting his method to that of socialist political action, he compares his philosophical methodology to the methods of medical diagnosis, prognosis and therapy: 'I have, determined by internal and external factors, decided to assess the diseases of the head and of the heart of mankind'.

Feuerbach's belief that the grounds for a true revolution lay in the liberation of human sensuousness and feeling in interpersonal relations, not primarily in the externalities of political life, had an enormous influence on the more radical former disciples of Hegel, the Young Hegelians Bruno Bauer, Karl Marx, Friedrich Engels, and Max Stirner. Instead of becoming a member of the 1848 revolutionary parliament in Frankfurt, he chose to lecture

publicly in Heidelberg where he declared religion to be closely related to politics, emphasizing that his lectures were focused on practical rather than theoretical politics. He maintained that 'individualism in practical consequence is socialism, but not in the sense of French individualism'; for him 'the dissolution of theology into anthropology in the realm of thinking is the dissolution of the monarchy into the republic in the realm of practice, of life…. Imagination is the power of religion and imagination is the power of the monarchy. Only so long will monarchs rule over humans as humans will be ruled by imagination. Despots rule only where phantasies rule' (Feuerbach 1846-66 VIII: 460). It has been stressed in the literature (Arvon 1964; Cabada 1975; Kamenka 1970; Sass 1972) that Feuerbach is not merely a transitional figure towards Marx and Marxism-Leninism, but an alternative to the concept of political revolution and party elites.

Thus Feuerbach gave his own meaning to the term 'communist', in direct opposition to that employed by Marx and the socialist movement, when answering Max Stirner's question 'where does Feuerbach stand?': 'neither a materialist, nor an idealist, nor an identity philosopher is Feuerbach. So, what is he? He is in thought what he is in his deeds, in spirit what he is in flesh, in essence what he is in his senses - human being [mensch]; for Feuerbach only sees the essence of man in community: communal being, communist' (Feuerbach 1846-66 V: 359).

In his *Grundsätze der Philosophie der Zukunft* (*Principles of the Philosophy of the Future*) (1843) Feuerbach uses the image of the ellipse having two focal points, as compared to the circle having only one centre, to compare the purely intellectual philosophy of Hegel and other schools of rationalism and metaphysics with his own approach of 'head and heart', rationality and sensuality, as the two commanding principles for theory and practice (Feuerbach 1846-66 II: 344). Marx took this image of the two centres of the ellipse from Feuerbach in 1844 in order to identify philosophy and proletariat as 'head and heart' of the emancipatorial process of history, this time in terms of political revolution, not educational and critical evolutionary emancipation as Feuerbach had done.

Feyerabend, Paul Karl (1924-94)

Feyerabend was an Austrian philosopher of science who spent most of his academic career in the USA. He was an early, persistent and influential critic of the positivist interpretation of science. Though his views have some affinities with those of Thomas Kuhn, they are in important ways more radical. Not only did Feyerabend become famous (or notorious) for advocating 'epistemological anarchism' - the position that there is no such thing as scientific method, so that in advancing scientific research 'anything goes' - he also argued that the scientific outlook is itself just one approach to dealing with the world, an approach that is not self-evidently superior in all respects to other approaches. This radicalism led to his being widely attacked as an irrationalist though perhaps he might better be seen as a sceptic in the humane and tolerant tradition of Sextus Empiricus and Montaigne.

Paul Feyerabend was born and educated in Austria. His studies were interrupted by the Second World War, in which he served as an infantry officer in the German army and was awarded the Iron Cross. His wartime service ended when a bullet in the spine left him with injuries from which he never fully recovered. After the war, he resumed his education, eventually switching from physics to philosophy of science. His academic career, which began in England and included a year working with Karl Popper, was spent mostly in the USA.

Feyerabend was an early and persistent critic of the once-dominant logical positivist interpretation of science. Like other such critics - Thomas Kuhn and N.R. Hanson for example - Feyerabend insisted on paying close attention to the history of science and to contemporary scientific debates. Again like them, he thought that such attention showed standard philosophical accounts of science to be wildly at variance with actual scientific practice.

Feyerabend is perhaps best remembered for two views. First, he was an early advocate of the view that competing theories are often 'incommensurable', meaning that there is no common standard by which their respective merits can be judged. Positivist philosophers of science sought such a standard in the 'basic' or 'protocol' statements of a purely observational language, uncontaminated by theoretical preconceptions (see Logical positivism §4). But according to Feyerabend - and this aspect of his thought goes all the way back to his doctoral dissertation - there is no such language. The meanings of the observation-terms that figure in statements relevant to the confirmation and disconfirmation of scientific theories are affected by the theories in which they are embedded. This can be disguised by the retention of the same words, as when both classical mechanics and special relativity talk about 'length'. But classical and relativistic length are different quantities, so that the measurement of 'length' is a different operation, depending on which theory we are working with (see Incommensurability; Observation).

Feyerabend argued further that, even if there were a pure observation language, this would not guarantee commensurability, since competing theories typically address themselves to different ranges of data. It is rarely, if ever, the case that a new theory explains everything an old theory explains and more besides. In consequence, choosing a new theory over an old one will typically involve explanatory loss as well as gain. For example, after Newton, theories of the heavens no longer attempt to explain the number of the planets, though it was previously thought essential to do so.

The second idea for which Feyerabend became famous - or notorious - is his 'epistemological anarchism'. Feyerabend denied that there is such a thing as 'scientific method': there are no universally valid methodological precepts by which scientific practice either is or should be governed. If we insist that there must be some such precept, the only defensible candidate is 'anything goes' (see Pluralism).

One of Feyerabend's reasons for taking this position was that methodology can no more be abstracted from substantive, theoretical ideas than can observation. (The quest for a permanent, theory-neutral, observation language is just one way of trying to force science into a methodological straightjacket.) But, even if it could, strict adherence to abstract methodological rules (such as Popper's critical rationalism, with its emphasis on attempts to falsify theories via severe tests) would spell the death of scientific progress. The history of science shows that all theories, even the most successful, swim in a sea of anomalies; but this is reason to develop them, even with the aid of *ad hoc* hypotheses, not a reason for going back to the drawing board. Furthermore, old, well-developed theories typically do better than new theories by just about any methodological standard one cares to name. In part, this reflects the 'law of uneven development': a persuasive defence of a new theory in one area may depend on

theoretical advances in various ancillary domains, and there is no guarantee that these will appear on cue. New ideas therefore need breathing space if we are to appreciate their full potential. But granting them this breathing space can involve violating any and every canon of ’rationality’. Feyerabend did not deny that, if a new idea turns out to be a good one, it will be possible - after the fact - to demonstrate its superiority according to one’s favourite methodological prescriptions. His point, however, was that such prescriptions provide no guidance whatsoever to the practice of research. Whatever story one tells about the merits of an idea that worked out well, there will be alternatives that, in their undeveloped state, look worse but which, in their turn, could prove to be better. One simply never knows, which is why there are no rules to guide our efforts (see Scientific method §2).

Feyerabend’s views have clear affinities with Kuhn’s. Nevertheless, while he admired Kuhn, he criticized him for remaining in thrall to the idea of method. According to Feyerabend, Kuhn’s distinction between ’normal’ and ’revolutionary’ science applies to different *aspects* of scientific research but not, contrary to Kuhn himself, to separable *phases*. However, Feyerabend did not only see Kuhn’s model as failing to correspond to the actual workings of science: he also regarded it as a disastrous normative ideal. This shows that, his professed anarchism notwithstanding, Feyerabend did have methodological advice to offer. Where Kuhn commends working within a dominant theoretical tradition, until it collapses from internal strains, Feyerabend held that progress depends on the constant proliferation of theoretical ideas, hence continuous ‘philosophical’ criticism of entrenched views. He saw the desirability of proliferation as a consequence of the fact that observation-terms and methodological preferences do not float free of background theoretical ideas, so that the experiments that supposedly *confirm* such ideas are often better seen as *illustrating* them. To be fully understood, hence seriously tested, a theory needs to be criticized from the outside, not just the inside. And since there is no neutral standpoint, beyond all theoretical preconceptions, this means criticized from the perspective of some alternative theory. Feyerabend differed from Popper in many ways, but his epistemological views, with their scepticism about justification and stress on the importance of critical argument, retained a distinctly Popperian coloration.

At the time of their publication, Feyerabend’s writings, especially his book *Against Method* (1975), enjoyed a considerable *succes de scandale*. They have come to seem less outrageous. While some of his views may strike some philosophers as overstated, their general spirit has some claim to be seen as today’s conventional wisdom. However, there is a way in which Feyerabend differed from most academic philosophers of science of his generation and which sets him apart even now. This is that he did not recommend proliferation merely as the best way of proceeding within science. On the contrary, he held that modern science is itself just one approach to dealing with the world and should not simply be assumed to be superior to alternative approaches.

By being willing to argue that, say, witchcraft could usefully be studied with the degree of seriousness currently reserved for science, Feyerabend acquired a reputation for irrationalism. This is hardly surprising, for when Feyerabend recommended studying witchcraft, he did not mean studying it in a scientific manner, as a detached observer: he meant immersing oneself in its practices, with a view to becoming a witch. In fact, it is not easy to gauge how seriously Feyerabend himself took the nonscientific outlooks he so often commended. He enjoyed playing the *enfant terrible* and, as he remarked in response to criticism of his supposed beliefs, ’argument is not confession’. But the main point is that what he opposed was not science as such but - our according any outlook, the scientific outlook included - authoritative status. His epistemological aim was to sharpen our critical sense by making us more keenly aware of the ways in which all outlooks have their weaknesses as well as their strengths, their costs as well as their benefits. Not surprisingly, then, he rejected the ’irrationalist’ label. What he objected to, he claimed, was all petrified conceptions of rationality, together with the orthodoxies they support. He can thus usefully be seen as a late representative of the classical sceptical tradition - the urbane and tolerant tradition of Sextus Empiricus and M. de Montaigne - in which the sceptic explores and counterposes all manner of competing ideas without regarding any as definitely established. The sceptic of this stamp need not deny his own *preferences*, including theoretical preferences, but he will not see them as singled out for approval by some extra-human authority: reason, for example. His scepticism thus grows out of the acuteness of his critical faculties. To the sceptic, his dogmatist opponents are the real irrationalists.

Feyerabend’s distrust of authority led him to argue that a truly humane society would make room for the greatest possible variety of what Mill called ’experiments in living’ (see Mill, J.S. §12). But although his philosophy took an increasingly political turn, he never gave serious thought to the question of how this conception of society might be given institutional expression under the conditions of modern life. In consequence, the political

dimension of his thought amounts only to a vague and romantic utopianism.

Fichte, Johann Gottlieb (1762-1814)

Fichte developed Kant's Critical philosophy into a system of his own, which he named 'Theory of Science' or Wissenschaftslehre. *Though Fichte continued to revise this system until the end of his life, almost all of his best known and most influential philosophical works were written in first portion of his career, when he was a professor at the University of Jena.*

The task of philosophy, as understood by Fichte, is to provide a transcendental explanation of ordinary consciousness and of everyday experience, from the standpoint of which philosophy must therefore abstract. Such an explanation can start either with the concept of free subjectivity ('the I') or with that of pure objectivity (the 'thing in itself'), the former being the principle of idealism and the latter that of what Fichte called 'dogmatism' (or transcendental realism). Though neither of these first principles can be theoretically demonstrated, the principle of freedom possesses the advantage of being practically or morally certain. Moreover, according to Fichte, only transcendental idealism, which begins with the principle of subjective freedom and then proceeds to derive objectivity and limitation as conditions for the possibility of any selfhood whatsoever, can actually accomplish the task of philosophy.

One of the distinctive features of Fichte's Jena system is its thoroughgoing integration of theoretical and practical reason, that is, its demonstration that there can be no (theoretical) cognition without (practical) striving, and vice versa. Another important feature is Fichte's demonstration of the necessary finitude of all actual selfhood. The 'absolute I' with which the system seems to begin turns out to be only a practical ideal of total self-determination, an ideal toward which the finite I continuously strives but can never achieve. Also emphasized in Fichte's Jena writings is the social or intersubjective character of all selfhood: an I is an I only in relationship to other finite rational subjects. This insight provides the basis for Fichte's political philosophy or 'theory of right', which is one of the more original portions of the overall system of the Wissenschaftslehre, *a system that also includes a foundational portion (or 'first philosophy'), a philosophy of nature, an ethics and a philosophy of religion.*

1 Life and works I: Jena

Born in the village of Rammenau in the Oberlausitz area of Saxony, Fichte was the eldest son in a family of poor and pious ribbon weavers. At the age of 9 his extraordinary intellectual talents brought him to the attention of a local baron, who sponsored his education, first at the Pforta school and then at the Universities of Jena and Leipzig. With the death of his patron, Fichte was forced to discontinue his studies and earn his livelihood as a private tutor, a profession the proud young man quickly came to detest.

After several years of such employment, including a long sojourn in Zurich, where he met his future wife, Johanna Rahn, Fichte returned to Leipzig to pursue a literary career. All his projects failed, however, and he was again forced to survive as a tutor. This time he was asked by a university student to give lessons in the Kantian philosophy (see KANT, I.). This encounter with Kant's writings in the summer of 1790 proved to be decisive, and Fichte became an instant convert to a philosophy he described as having 'occasioned a revolution in my way of thinking'. Eventually he made his way to Königsberg, where he lived for a few months. After his first disappointing interview with Kant, he resolved to demonstrate his mastery of the new philosophy by writing a treatise on a theme as yet unaddressed by Kant: namely, the question of the compatibility of the former with any concept of divine revelation. In just a few weeks Fichte composed a remarkable manuscript in which he concluded that the only revelation consistent with the Critical philosophy is the moral law itself. Suitably impressed, Kant helped to arrange the publication of Fichte's manuscript, which was published by Kant's own publisher in 1792 under the title *Versuch eine Kritik aller Offenbarung (Attempt at a Critique of All Revelation)*. For reasons that have never been satisfactorily explained, the first edition appeared without the author's name and preface. Not surprisingly, the book was hailed as a product of Kant's own pen and was widely praised as such. When the true identity of its author was revealed, Fichte was immediately catapulted from total obscurity to philosophical celebrity.

At the time that this stroke of fortune occurred Fichte was again employed as a private tutor, this time in Poland, where he was also working on several political tracts, including the provocatively entitled *Reclamation of the Freedom of Thought from the Princes of Europe, who have Hitherto Suppressed it* (1793). In the summer of 1793,

however, he returned to Zurich where he married his fiancée and oversaw the publication of the first two instalments of his spirited *Contribution to the Rectification of the Public's Judgment of the French Revolution* (1793 and 1794), a work in which he outlined his own democratic view of legitimate state authority and insisted passionately on the right of revolution. Even though both of these political tracts were published anonymously, Fichte was widely known to be their author and thus acquired an early reputation as a political - as well as a religious and philosophical - radical.

In Zurich, Fichte's time was increasingly occupied by his efforts to construct for himself a systematic revision of what he still took to be Kant's Critical philosophy. It was while he was so engaged that he received an invitation to assume the recently vacated chair of Critical Philosophy at the University of Jena, which was rapidly emerging as the capital of the new philosophy and, together with nearby Weimar, as one of the liveliest intellectual centres in the German-speaking world.

Fichte arrived in Jena in May of 1794, and enjoyed tremendous success there for the next six years, during which time he laid the foundations and developed the first systematic articulations of his new system (the *Wissenschaftslehre* or 'Theory of Science'). Even as he was engaged in this tremendous theoretical labour, he also tried to address a larger, popular audience and also threw himself into various practical efforts to reform university life. As one bemused colleague accurately remarked, 'His is a restless spirit; he thirsts for some opportunity to act in the world. Fichte wants to employ his philosophy to guide the spirit of his age'. This passionate striving to address the pressing needs of his own time is plainly evident in the text of the enormously popular public lectures that he began to deliver immediately upon his arrival in Jena and published under the title *Einige Vorlesungen über die Bestimmung des Gelehrten (Some Lectures concerning the Scholar's Vocation)* (1794c).

The first hint of Fichte's new philosophical project and strategy came in his 1794a review of G.E. Schulze's *Aenesidemus*, which was soon followed by a brief but important manifesto for the new system, *Über den Begriff der Wissenschaftslehre (Concerning the Concept of the Wissenschaftslehre)* (1794b). The first full - albeit still provisional - presentation of the first or 'foundational' portion of the new system was presented in the so-called private lectures that Fichte delivered during the 1794-5 academic year, lectures he arranged to have printed in fascicles for the convenience of his students, to whom these printed sheets were distributed in instalments over the course of the year. Eventually, these same pages were bound together and offered to the public under the title *Grundlage der gesamten Wissenschaftslehre Wissenschaftslehre (Foundations of the Entire Wissenschaftslehre)* (Parts I and II, 1794; Part III, 1795), supplemented by the *Grunriß des Eigenthümlichen der Wissenschaftslehre in Rüchsicht auf das theoretishce Vermögen (Outline of the Distinctive Character of the Wissenschaftslehre with Respect to the Theoretical Faculty)* (1795), though each of these publications still bore on its title page the words 'a manuscript for the use of his listeners'.

Dissatisfied with many features of this initial presentation and surprised and shocked by the virtually universal misunderstanding of his published *Foundations*, Fichte immediately set to work on an entirely new exposition of the same, which he repeated three times in his private lectures on 'The Foundations of Transcendental Philosophy (*Wissenschaftslehre*) *nova methodo*' (1796-7, 1797-8, 1798-9). Though he intended to revise these lectures for serial publication under the title *An Attempt at a New Presentation of the Wissenschaftslehre in the Philosophisches Journal einer Gesellschaft Teutscher Gelehrten*, of which he himself was by then co-editor, the only portions of this projected *New Presentation* that ever appeared were the 'First and Second Introductions to the *Wissenschaftslehre*' (1797) and Chapter One of the same (1798).

At the same time that Fichte was revising the presentation of the foundational portion of his system he was also elaborating its various subdivisions or branches - first in private lectures and then in published treatises on *Foundations of Natural Right Based on the Wissenschaftslehre* (1796-7) and *Das System der Sittenlehre nach den Principien der Wissenschaftslehre) (System of Ethical Theory Based on the Wissenschaftslehre)* (1798a). Fichte's intention was then to turn to the development of the remaining subdivision of his system and to expound a philosophy of religion 'in accordance with the principles of the Wissenschaftslehre', but before he had a chance to do this he published a brief essay *Üeber den Grund unsers Glaubens an eine göttliche Weltregierung (On the Basis of Our Belief in a Divine Governance of the World)* (1798b), in which he attempted to sketch some of his preliminary ideas on this topic. This essay, along with another by K.L. Forberg, that was contained in the same issue of the *Philosophisches Journal*, provoked an anonymous author to publish a pamphlet charging Fichte with

atheism, which eventually led to the official suppression of the offending issue of the journal and to public threats by various German princes to prevent their students from enrolling at the University of Jena. The crisis produced by these actions and the growing number of publications for and against Fichte - which included an intemperate *Appeal to the Public* by Fichte himself (1799) - quickly assumed a life and even a name of its own: 'the Atheism Controversy' or *Atheismusstreit*. In the end, Fichte badly miscalculated his own position and was finally forced to resign from Jena and flee to Berlin, where he arrived in the summer of 1799 and where the final phase of his career largely unfolded.

2 Life and works II: Berlin

In Berlin, which was not yet home to a university, Fichte supported himself by giving private lectures on his philosophy and by a new flurry of literary production, increasingly aimed at a large, popular audience. The first of these new writings was a brilliant popular presentation of some of the characteristic features and conclusions of Fichte's system, with a strong emphasis upon the moral and religious character of the same. This work, *Die Bestimmung des Menschen (The Vocation of Man)* (1800b), which is perhaps Fichte's greatest literary achievements, was published in 1800, the same year that he also published a typically bold foray into political economy, *The Closed Commercial State*, in which he propounds a curious blend of socialist political ideas and protectionist economic principles. Defending his own philosophy against misunderstanding remained a primary concern for Fichte, however, as is attested by the publication in 1801 of the poignantly titled *Sonnenklarer Bericht an das größere Publikum über das eigentliche Wesen der neuesten Philosophie. Ein Versuch, die Leser zum verstehen zu zwingen (Sun-Clear Report to the Public at Large on the Actual Character of the latest Philosophy: An Attempt to Force the Reader to Understand).*

At the same time that he was addressing the public, Fichte was deeply engrossed in yet another effort to rethink and to restructure the foundations of his system. Hardly a year went by that he did not produce, either for his own use, or else for use in conjunction with the private lectures he was delivering in Berlin, yet another completely new version of the *Wissenschaftslehre*, each of which differed more and more dramatically from the familiar published version of 1794-5. (By 1804, for example, most references to 'the I' had been replaced with references to 'the absolute' and its various 'appearances'.) Having learned a lesson from the public reception of his 1794-5 presentation, Fichte resolved never to publish any of these new versions of his system (of which more than a dozen survive in manuscript), explaining in an official pro memoria of 3 January 1804 that the author of the *Wissenschaftslehre* 'wishes to confine himself to oral communication, so that misunderstanding can thereby be detected and eliminated on the spot'. Consequently, the sole public hint of Fichte's new understanding of his system was a brief and enigmatic *Die Wissenschaftslehre, in ihrem allgemeinen Umrisse dargestellt (General Outline of the Wissenschaftslehre)* published in 1810, as well as whatever hints in this direction readers might glean from the popular works published during this period.

In 1805 Fichte spent a semester lecturing at the University of Erlangen, but returned in the autumn to Berlin, where, in 1806, he published in rapid succession three popular and well-received books, all of which were based upon earlier lectures: *On the Essence of the Scholar* (a reworking of some of the same themes first addressed in the similarly titled lectures of 1794); *Der Grundzüge des gegewärtigen Zeitalters (Characteristics of the Present Age)* (1806a) (an attempt to show the implications of his 'system of freedom' for a speculative philosophy of history); and *Guide to the Blessed Life* (an eloquent and rather mystical treatise on philosophy and religion). With the entry of the French army into Berlin in 1806, Fichte joined the Prussian government in exile in Königsberg, where he held yet another course of lectures on the *Wissenschaftslehre* and wrote an important short work on *Machiavelli as Author* (1807), in which he defends a form of Realpolitik that appears to contrast starkly with the liberalism and political idealism of his earlier writings. Eventually, however, he returned to Berlin, where, under the eyes of the occupying forces, he delivered his celebrated *Reden an die deutsche Nation (Addresses to the German Nation)* (1808). Though these lectures later obtained a place of dubious honour as founding documents in the history of German nationalism, they are mainly concerned with the issue of national identity - and hence with the question of national education (which is the main topic of the work) - as a means to a larger, cosmopolitan end.

Fichte had always had a lively interest in pedagogical issues and hence took a leading role in planning the new Prussian university to be established in Berlin. Appropriately, when the new university finally opened in 1810, Fichte himself served as the first head of the philosophical faculty as well as the first elected rector of the entire

university. His final years saw no diminution in the pace either of his public activity or of his philosophical efforts. He continued to produce new lectures on the foundations and first principles of his system, as well as new introductory lectures on philosophy in general (‘Logic and Philosophy’ (1812) and ‘The Facts of Consciousness’ (1813)), political philosophy (‘System of the Theory of Right’ (1812) and ‘Theory of the State’ (1813)) and ethics (‘System of Ethical Theory’ (1812)). As presaged by the book on Machiavelli, these late forays into the domain of practical philosophy paint a far darker picture of human nature and defend a much more authoritarian view of the state than anything to be found in the earlier, published writings on these subject.

In 1813 Fichte cancelled his lectures so that his students could enlist in the ‘War of Liberation’ against Napoleon, of which Fichte himself proved to be an indirect casualty. Through his wife, who was serving as a volunteer nurse in a Berlin military hospital, he contracted an infection of which he died on 29 January 1814.

3 The project of a *Wissenschaftslehre*

The primary task of Fichte’s system of philosophy is to reconcile freedom with necessity, or, more specifically, to explain how freely willing, morally responsible agents can at the same time be considered part of a world of causally conditioned material objects in space and time. Fichte’s strategy for answering this question was to begin simply with the ungrounded assertion of the subjective spontaneity and freedom (infinity) of the I and then to proceed to a transcendental derivation of objective necessity and limitation (finitude) as a condition necessary for the possibility of the former. Hence, in his ‘First Introduction to the *Wissenschaftslehre*’ (1797), he describes philosophy’s task as that of ‘displaying the foundation of experience’, that is, ‘explaining the basis of the system of representations accompanied by a feeling of necessity’. Fichte owed this conception of the task and strategy of philosophy entirely to his reading of Kant, and no matter how far his own presentation of his system seemed to diverge from ‘the letter’ of Kant’s own presentation, he always maintained that it remained true to ‘the spirit’ of the same - which, for Fichte, lay entirely in its uncompromising insistence upon the practical indubitability of human freedom and its thoroughgoing dedication to the project of giving a transcendental account of ordinary experience that could explain the objectivity and necessity of theoretical reason (cognition) in a manner consistent with the affirmation of human liberty. For this reason Fichte sometimes referred to his own presentation of this same philosophy as ‘the system of human freedom’.

In accordance with this conception of philosophy’s task, Fichte insisted firmly upon the sharp distinction between the ‘standpoint’ of natural consciousness (which it is the task of philosophy to somehow ‘explain’) and that of transcendental reflection (from which alone such a philosophical explanation can be conducted - if at all). Thus there is no possible conflict between transcendental idealism and everyday realism; on the contrary, the whole point of the former is to demonstrate the necessity and unavoidability of the latter.

However ‘Kantian’ in spirit Fichte’s enterprise might have been, he was at the same time all too keenly aware of certain glaring weaknesses and inadequacies in Kant’s own execution of this project. Taking to heart the criticisms of such contemporaries as F. JACOBI, Salomon Maimon and G.E. Schulze, Fichte realized, first, that the doctrine of the thing in itself, understood as an external cause of sensations, was indefensible on Critical grounds, and second, that Kant’s denial of the possibility of ‘intellectual intuition’, though certainly justified as a denial of the possibility of any non-sensory awareness of objects, was nevertheless difficult to reconcile with certain other Kantian doctrines regarding the subject’s presence to itself both as a (theoretically) cognizing subject (the doctrine of the transcendental apperception) and as a (practically) striving moral agent (the doctrine of the categorical imperative).

Fichte was also persuaded by his reading of the works of K. L. REINHOLD that the systematic unity of the Critical philosophy - specifically, the unity of theoretical and practical reason, of the First and Second *Critiques* - was insufficiently apparent in Kant’s own presentation of his philosophy. His study of Reinhold also convinced him that the most promising way to display the unity in question would be to provide both theoretical and practical philosophy with a common foundation. The task, then, was to discover a single, self-evident starting point or first principle from which one could then somehow deduce or ‘derive’ both theoretical and practical philosophy. Not only would such a method guarantee the systematic unity of philosophy itself, but, more importantly, it would also display what Kant hinted at but never demonstrated: namely, the underlying unity of reason itself.

Since it is a central task of philosophy, so construed, to establish the very possibility of any knowledge or science

(*Wissenschaft*) whatsoever, Fichte proposed to replace the disputed term 'philosophy' (or 'love of wisdom') with the new term *Wissenschaftslehre* or 'Theory of Science' - a name that clearly designates the distinctively 'second order' character of philosophical reflection. Though Fichte's proposal never caught on as a general name for what was once called 'philosophy', it did become the universally acknowledged name for his own distinctive version of transcendental idealism. It is, however, important to note that *Wissenschaftslehre* is not the name of any particular Fichtean treatise, but is instead the general name for his entire system or project - a larger system that consists of a number of interrelated parts or systematic subdisciplines and an overarching project that could be expounded in a series of radically different presentations and a bewildering variety of systematic vocabularies. In fact, Fichte spent his entire life demonstrating this last point: that is, expounding and re-expounding what he himself took to be the same philosophy ('the *Wissenschaftslehre*') in a number of radically different forms and guises (*The Foundations of the Entire Wissenschaftslehre* of 1794-5, 'Wissenschaftslehre nova methodo', 'the *Wissenschaftslehre* of 1801-2', 'the 1804 *Wissenschaftslehre*', 'the *Wissenschaftslehre* of 1805', and so on) - more than a dozen in all between 1794 and 1814.

4 Idealism versus dogmatism

In order to construct any genuine philosophy of freedom, thought Fichte, the reality of freedom itself must simply be presupposed and thus treated as an incontrovertible 'fact of reason' in the Kantian sense. This, of course, is not to deny the possibility of raising theoretical objections to such claims; on the contrary, it was the very impossibility of any theoretically satisfactory refutation of scepticism concerning the reality of freedom that led Fichte to the recognition of the inescapable 'primacy of the practical' with respect to the selection of any philosophical starting point.

In so far as any proposed first principle of philosophy is really supposed to be the 'first principle' of all knowledge and hence of all argument, it clearly cannot be derived from any higher principle and hence cannot be established by any sort of argument. Furthermore, Fichte maintained that there are two and only two possible starting points for the philosophical 'explanation' of experience sketched above: namely, the concept of pure selfhood (freedom) and that of pure thinghood (necessity) - neither of which can be warranted, *qua* philosophical starting point, by a direct appeal to experience, and both of which can be arrived at only by a selfconscious act of philosophical abstraction from ordinary experience (within which freedom and necessity, subject and object, are invariably joined).

The two rival philosophical strategies made possible by these opposed starting points are unforgettably limned by Fichte his two 1797 *Introductions to the Wissenschaftslehre*, where he characterizes the sort of philosophy that begins with the pure I as 'idealism' and that which begins with the thing in itself as 'dogmatism'. Since, according to Fichte's earlier argument in *Concerning the Concept of the Wissenschaftslehre*, a unified system of philosophy can have one and only one first principle, and since there are two and only two possible first principles, then it follows that no 'mixed' system of idealism/dogmatism is possible. Moreover, since dogmatism, as understood by Fichte, unavoidably implies a strict form of determinism or 'fatalism', whereas idealism is, from the start, committed to the reality of human freedom, it is also practically impossible to reach any sort of 'compromise' between two such radically opposed systems.

Though Fichte conceded that neither dogmatism nor idealism could directly refute its opposite and also recognized that the choice between philosophical starting points could not be resolved philosophically, he nevertheless denied that any dogmatic system - any system that started with the concept of sheer objectivity - could ever succeed in accomplishing what was required of all philosophy. Dogmatism, he argued, could never provide a transcendental deduction of ordinary consciousness, for, in order to accomplish this, it would have to make an illicit leap from the realm of things to the realm of mental ideas or 'representations' (*Vorstellungen*). Idealism, in contrast, at least when correctly understood as the sort of Critical idealism that recognizes that the intellect itself most operate in accordance with certain necessary laws, could - at least in principle - accomplish the prescribed task and explain our experience of objects ('representations accompanied by a feeling of necessity') in terms of the necessary operations of the intellect itself, without having to make an illicit appeal to things in themselves. To be sure, one cannot decide in advance whether or not any such deduction of experience from the mere concept of free selfconsciousness is *in fact* possible. This is something that can be decided only after the construction of the system in question. Until then, it remains a mere hypothesis that the principle of human freedom, for all of its

practical certainty, is also the proper starting point for a transcendental account of objective experience.

Returning to the question of the starting point, however, it still must be granted that the truth of the latter cannot be established by any philosophical means, including its utility as a philosophical first principle. On the contrary, one must be convinced, on wholly extraphilosophical grounds, of the reality of one's own freedom before one can enter into the chain of deductions and arguments that constitute the system of transcendental idealism. This is the meaning of Fichte's oft-cited assertion that 'the kind of philosophy one chooses depends upon the kind of person one is'.

In the end, the only reason why transcendental idealists come to a stop with - and thus begins their philosophy with - the proposition 'the I freely posits itself' is not because they are unable to entertain theoretical doubts on this point nor because they cannot continue the process of reflective abstraction. Instead, as Fichte explains in his essay *On the Basis of Our Belief in a Divine Governance of the World*, 'I cannot go beyond this standpoint because I am not permitted to do so'. Of course I could think of myself as determined by things, but still 'I ought to begin my thinking with the thought of the pure I, and I ought to think of this pure I as acting with absolute spontaneity - not as determined by things, but rather, as determining them'. It is precisely because the categorical imperative is in this way invoked to secure the first principle of his entire system that Fichte can make the rather startling claim that the '*Wissenschaftslehre* is the only kind of philosophical thinking that accords with duty'.

5 Foundations of the Jena *Wissenschaftslehre*

The published presentation of the first principles of the Jena *Wissenschaftslehre* commences with the proposition 'the I posits itself'; more specifically, 'the I posits itself as an I - that is, as positing itself'. To be sure, this starting point is somewhat obscured in the *Foundations of the Entire Wissenschaftslehre* by a difficult and somewhat forced attempt to connect this starting point to the logical law of identity, as well as by the introduction of two additional 'first principles', corresponding to the logical laws of non-contradiction and sufficient reason. (Significantly, this distraction is eliminated entirely in the 1796-9 lectures on *Wissenschaftslehre nova methodo*.)

'To posit' (*setzen*) means simply 'to be aware of', 'to reflect upon', or 'to be conscious of', and thus the principle in question simply states that the essence of selfhood lies in the assertion of ones own self-identity. Such immediate self-identify, however, cannot be understood as a 'fact', no matter how privileged, nor as an 'accident' of some previously existing substance or being. Instead, it must be understood as an *activity*, albeit an activity of a most extraordinary, auto-productive type: in Fichte's own language, it is a *Tathandlung* or 'fact/act', a unity that is presupposed by and contained within every fact and every act of empirical consciousness, though it never appears as such therein.

This same 'identity in difference' of self-consciousness might also be described as an 'intellectual intuition', since it involves the immediate presence of the I to itself, prior to and independently of any sensory content. Understood in this way, this original intellectual intuition is merely the reflectively realized presupposition for the possibility of actual consciousness and does not designate any act or state of actual, empirical consciousness - including the consciousness of the philosopher. Fichte himself, however, confuses matters by sometimes using the term 'intellectual intuition' to designate the act of philosophical reflection through which the philosopher arrives at the former concept or, on still other occasions, to indicate our direct, practical awareness within everyday life of our moral obligations (categorical imperative *qua* 'real intellectual intuition'). Given the subsequent abuse of this term by SCHELLING and the romantics, it is important to recognize its systematic ambiguity in Fichte's own writings. Significantly, the term 'intellectual intuition' does not even occur in the 1794-5 *Foundations*.

A fundamental corollary of Fichte's understanding of selfhood as a kind of act is his denial that the I is originally any sort of 'substance'. Instead, the I is simply what it posits itself to be, and thus its 'being' is, so to speak, a consequence of its self-positing. The first principle of the Jena *Wissenschaftslehre* is thus equally 'practical' and 'theoretical', insofar as the act described by this principle is a 'doing' as well as a 'knowing', a deed as well as a cognition. Thus the problematic unity of theoretical and practical reason is guaranteed from the start, inasmuch as this very unity is a condition for the possibility of selfconsciousness.

After establishing the first principle and conceiving the act expressed therein, the philosophical task is then to discover what other acts must occur as conditions for the possibility of the original, 'simply posited', first act and then to do the same for each of these successively discovered acts (or the theorems in which they are formulated).

By continuing in this manner, one will finally arrive at a complete deduction of the a priori structure of ordinary experience - or, what amount to the same thing, a complete inventory of the ‘original acts of the mind’. This is precisely the task of the first or ‘foundational’ portion of the Jena system.

Just as we are never directly aware of the original act of self-positing with which the system commences, so we are also unaware - except, of course, from the artificial standpoint of philosophical reflection - of each of these additional ‘necessary but unconscious’, acts that are derived as conditions necessary for the possibility of this first act. Furthermore, though we must, due to the discursive character of reflection itself, distinguish each of these acts from the others that it is conditioned by and that are, in turn, conditioned by it, none of these individual acts can actually occur in isolation from all of the others. Thus what transcendental philosophy actually does is to *analyse* what is in fact the single, *synthetic* act through which the I posits for itself both itself and its world, thereby becoming aware in a single moment of both its freedom and its limitations, its infinity and its finitude. The result of such an analysis is a clear realization on the part of the transcendental philosopher that, although ‘the I simply posits itself’, its freedom is never ‘absolute’ or ‘unlimited’; instead, freedom proves to be conceivable - and hence the I itself proves to be ‘possible’ - only as limited and finite. Despite widespread misunderstanding of this point, the *Wissenschaftslehre* is not a philosophy of the absolute I. Instead, the conclusion of both the *Foundations of the Entire Wissenschaftslehre* and of the *Wissenschaftslehre nova methodo* is that the ‘absolute I’ is a mere abstraction and that the only sort of I that can actually exist or act is a finite, empirical, embodied, individual self.

An I must posit itself in order to be an I at all; but it can posit itself only insofar as it posits itself as limited (and hence divided against itself). Moreover, it cannot even posit for itself its own limitations, in the sense of producing or creating these limits. Instead, according to Fichte’s analysis, if the I is to posit itself at all, it must simply discover itself to be limited, a discovery that Fichte characterizes as a ‘check’ or *Anstoß* to the free, practical activity of the I. Such an original limitation of the I itself is first posited as a mere ‘feeling’, then as a ‘sensation’, then as an ‘intuition’ of a thing, and finally as a ‘concept’. The *Anstoß* thus provides the essential occasion that first sets in motion the entire complex train of activities that finally result in our conscious experience both of ourselves as empirical individuals and of a world of spatio-temporal material objects.

Though this doctrine of the *Anstoß* may seem to play a role in Fichte’s philosophy not unlike that which has sometimes been assigned to the thing in itself in the Kantian system, the fundamental difference is this: the *Anstoß* is not something foreign to the I. Instead, this term signifies the I’s original encounter with its own finitude. Rather than claim that the Not-I is the cause or ground of the *Anstoß*, Fichte argues that the former is posited by the I in order to explain to itself the latter. Though the *Wissenschaftslehre* demonstrates that such an *Anstoß* must occur if selfconsciousness is to be actual, philosophy itself is quite unable to ‘deduce’ or to ‘explain’ the actual occurrence of such an *Anstoß* - except as a condition for the possibility of consciousness. Accordingly, there are strict limits to what can be expected from any a priori deduction of experience. Though transcendental philosophy can explain, for example, why the world has a spatio-temporal character and a causal structure, it can never explain why objects have the particular sensible properties they happen to have. This is something that the I simply has to ‘discover’ at the same time that it discovers its own freedom, and indeed, as a condition for the latter.

But there remains much that can be demonstrated within the foundational portion of the *Wissenschaftslehre*. For example, it can be shown that the I could not become conscious of its own limits in the manner required for the possibility of any self-consciousness unless it also possessed an original and spontaneous ability to synthesize the finite and the infinite. In this sense, the *Wissenschaftslehre* deduces the power of productive imagination as an original power of the mind. Similarly, it can be shown that the I could not be ‘checked’ in the manner required for the possibility of consciousness unless it possessed, in addition to its original ‘theoretical’ power of productive imagination, an equally original ‘practical’ power of sheer willing, which, once ‘checked’, is immediately converted into a capacity for endless striving. The *Wissenschaftslehre* thus also includes a deduction of the categorical imperative and of the practical power of the self. For Fichte, therefore the Kantian principle of ‘the primacy of practical reason’ means not simply that philosophy must recognize a certain autonomous sphere within which practical reason is efficacious and practical considerations are appropriate; instead, it implies something much stronger: namely, the recognition that ‘the practical power is the innermost root of the I’ and thus that ‘our freedom itself is a theoretical determining principle of our world’. The *Wissenschaftslehre* demonstrates from the very start that reason could not be theoretical if it were not also practical - at the same time, to be sure, that it also demonstrates the converse of this proposition, that reason could not be practical if were not also theoretical.

Freedom, according to Fichte's argument, is possible and actual only within the context of natural necessity, and thus it is never 'absolute', but always limited and finite. On the other hand, just as surely as a free subject must posit its freedom 'absolutely' - that is to say, 'purely and simply' (*schlechthin*) or 'for no reason' - so must it never identify itself with any determinate or limited state whatsoever. Instead, a finite free self must constantly strive to transform both the natural and the human worlds in accordance with its own freely-posited goals. The sheer unity of the self posited in the starting point of the *Foundations* is thereby transformed into an idea of reason in the Kantian sense: the actual I is always finite and divided against itself, and hence always striving for a sheer self-determinacy that it never achieves. Between the original abstraction of pure selfhood as pure *Tathandlung* and the concluding ideal of a self that is only what it determines itself to be, in which 'is' and 'ought' wholly coincide, lies the entire realm of actual consciousness and experience.

6 Philosophy of nature and ethics

Having established the foundations of his new system, Fichte then turned to the task of erecting a fully-articulated transcendental system according to a plan that is perhaps most clearly outlined in 'The Deduction of the Subdivisions of the *Wissenschaftslehre*', with which the lectures on '*Wissenschaftslehre nova methodo*' conclude. At least as conceived during the Jena years, the entire *Wissenschaftslehre* consists of four parts: (1) first philosophy, which is to say, the 'foundational' portion of the system; (2) 'theoretical philosophy' or 'philosophy of nature', the latter understood in a sense corresponding to Kant's *Metaphysical First Principles of Nature*; (3) 'practical philosophy' or ethics; and (4) 'philosophy of the postulates', which includes the subdisciplines of political philosophy or 'theory of right' and philosophy of religion.

The closest Fichte himself ever came to developing a philosophy of nature according to transcendental principles is the compressed account of the same presented in the *Outline of the Distinctive Character of the Wissenschaftslehre with Respect to the Theoretical Faculty* (1795), in which, however, the domain of specifically 'theoretical' philosophy is not rigorously distinguished from the 'theoretical' portion of the *Foundations*, which also includes a discussion of the a priori structure of the objective world. In fact, the kind of theoretical philosophy of nature made possible by the *Wissenschaftslehre* turns out to be even more modest than Kant's and more closely resembles what later came to be called the philosophy of (natural) science than it does the speculative *Naturphilosophie* of Schelling and HEGEL.

In contrast to Fichte's rather cursory treatment of purely theoretical philosophy, ethics or 'practical philosophy', which analyses the determinate ways in which willing and acting are determinable by principles of pure reason, constitutes a major portion of the Jena system, and the *System of Ethical Theory* (1798a) is Fichte's longest single book. Whereas theoretical philosophy 'explains how the world is, and the result is the same as pure experience', practical philosophy 'explains how the world ought to be constructed by rational beings, and its result is something ideal'. Ethics thus considers the object of consciousness not as something given or even constructed by necessary laws of consciousness, but rather as something to be produced by a freely acting subject, consciously striving to establish and to accomplish its own goals. The specific task of Fichte's ethics is therefore to deduce from the general obligation to determine oneself freely the particular obligations of every finite rational being.

Viewed from the perspective of practical philosophy, the world really is nothing more than what Fichte once described as 'the material of our duty made sensible', which is precisely the viewpoint adopted by the morally engaged, practically striving subject. On the other hand, this is not the only way the world can be viewed, and, more specifically, it is not the only way in which it is construed by transcendental philosophy. For this reason it is somewhat misleading to characterize the *Wissenschaftslehre* as a whole as a system of 'ethical idealism'. As noted above, Fichte certainly does succeed in constructing an account of consciousness that fully integrates the imperatives and activities of practical reason into the very structure of the latter, but this integration is always balanced by a recognition, first, of the constitutive role of theoretical reason, and secondly, of the sheer 'giveness' of the I's original determinacy (doctrine of the *Anstoß*).

7 Political philosophy and philosophy of religion

The final portion of the Jena system is devoted to 'the philosophy of the postulates', a discipline conceived as occupying the middle ground between purely theoretical and purely practical philosophy. In this portion of the system the world is considered neither as it simply is nor as it simply ought to be; instead, the moral world is itself

considered from the perspective of the natural world (that is, one considers the postulates that theoretical reason addresses to the practical realm) or else, alternatively, the natural world is considered from the perspective of the moral world order (that is, one considers the postulates that practical reason addresses to the realm of theory). The first of these perspectives is that of political philosophy, or what Fichte calls ‘theory of right’ or sometimes the domain of ‘natural right’; the latter is that of the philosophy of religion.

A transcendental theory of right proceeds from the general principle that one must limit one’s own freedom in accordance with an a priori concept of the other free beings with whom one comes into contact, and goes on to consider the precise conditions under which such a postulated society of free and equal individuals is in fact possible. Ultimately, this leads Fichte to the formulation of his own version of the contract theory of political legitimacy.

If one is to posit one’s own freedom, then one must posit the freedom of others and limit one’s own freedom accordingly. It follows that a just political order is a demand of reason itself, since ‘the concept of justice or right is a condition of selfconsciousness’. This passage, from the *Foundations of Natural Right*, points to what is perhaps the most original feature of Fichte’s political philosophy: its attempt to demonstrate the intrinsically social character of reason itself and thus to deduce the concept of right from the ‘reciprocal concept’ of an individual free being. The strategy of Fichte’s deduction of intersubjectivity is to establish, first, that an I can posit itself only as an individual and, second, that it can posit itself as an individual only insofar as it recognizes other free individuals - a recognition facilitated by the presence, within selfconsciousness itself, of an immediate awareness of oneself as ‘summoned’ by the other to limit oneself freely in recognition of the latter’s freedom. This a priori deduction of intersubjectivity is so central to the conception of selfhood developed in the Jena *Wissenschaftslehre* that Fichte, in his lectures on *Wissenschaftslehre nova methodo*, incorporated it into his revised presentation of the very foundations of his system.

The theory of natural right developed by Fichte during his Jena period is clearly quite different from the kind of theories that have traditionally gone by this name. The task of Fichte’s theory of right is to consider the specific ways in which the freedom of each individual must be restricted so that several individuals can live together with the maximum amount of mutual freedom. Furthermore, it derives its a priori concepts of the laws of social interaction entirely from the sheer concept of an individual I, as conditions for the possibility of the latter. The concept of right obtains its binding force not from the ethical law, but rather from the general laws of thinking and from enlightened self-interest, and the force of such considerations is hypothetical rather than categorical. The theory of right examines how the freedom of each must be externally limited if a free society of equals is to be possible.

Unlike Kant, Fichte does not treat political philosophy merely as a subdivision of moral theory, but as an independent philosophical discipline with a topic and laws of its own. Whereas ethics analyses the concept of what is *demanded* of a freely willing subject, the theory of right describes what such a subject is *permitted* to do; and whereas ethics is concerned with the inner world of conscience, the theory of right is concerned only with the external, public realm, though only insofar as the latter can be viewed as an embodiment of freedom. If the *Wissenschaftslehre* as a whole can be described, in Fichte’s words, as a ‘system of freedom’, then the spirit of such a system is perhaps best reflected in the distinctively liberal political philosophy based thereupon.

In addition to the postulates addressed by theoretical to practical reason, there are also those addressed by practical reason to nature itself. The latter is the domain of the transcendental philosophy of religion, which is concerned solely with the question of the extent to which the realm of nature can be said to accommodate itself to the aims of morality. The questions dealt with within such a philosophy of religion are those concerning the nature, limits, and legitimacy of our belief in divine providence.

As it happened, Fichte never had a chance to develop this final subdivision of his Jena system and, somewhat ironically, he was prevented from doing so by a controversy that erupted in the wake of the publication, in 1798, of a tentative foray into this very domain in his essay *On the Basis of Our Belief in a Divine Governance of the World*. In this essay Fichte seems to contend that, so far as philosophy is concerned, the realm of the divine is wholly coextensive with that of the moral law itself and that no further inference to a ‘moral lawgiver’ is theoretically or practically required or warranted. In this same essay Fichte also sought to draw a sharp distinction between religion and philosophy (a distinction parallel to the crucial distinction between the ‘ordinary’ and

'transcendental' standpoints) and to defend philosophy's right to postulate something like a 'moral world order'. Philosophy of religion would thus include a deduction of the postulate that our moral actions really do make some difference in the world. The argument of the essay *On the Basis of Our Belief* is, nevertheless, primarily a negative one, designed to deny that any postulate of the existence of a God independent of the moral law is justifiable on philosophical grounds. In the wake of the atheism controversy, Fichte returned to this subject and, in his *From a Private Letter* (1800) and in Part III of *The Vocation of Man* (1800b), attempted to restate his position in a manner that at least appeared to be more compatible with the claims of theism.

Ficino, Marsilio (1433-99)

With Giovanni Pico della Mirandola, Marsilio Ficino was the most important philosopher working under the patronage of Lorenzo de'Medici, 'Il Magnifico', in the Florence of the High Renaissance. Ficino's main contribution was as a translator of Platonic philosophy from Greek into Latin: he produced the first complete Latin version of the works of Plato (1484) and Plotinus (1492) as well as renderings of a number of minor Platonists. He supplied many of his translations with philosophical commentaries, and these came to exercise great influence on the interpretation of Platonic philosophy in the Renaissance and early modern periods. Ficino's most important philosophical work, the Theologia platonica de immortalitate animae (Platonic Theology, On the Immortality of the Soul) (1474) aimed to use Platonic arguments to combat the Averroists, 'impious' scholastic philosophers who denied that the immortality of the soul could be proven by reason. The most famous concept associated with his name is that of 'Platonic love'.

1 Life and mission

Marsilio Ficino was born in 1433 in Figline Valdarno, a small town in the territory of Florence; his father, Dietifeci, was a doctor who worked in the city of Florence and served as private physician to Cosimo de'Medici, then the *de facto* ruler of Florence. Dietifeci intended that his son should follow him in the medical profession, and the young Marsilio was sent to the University of Florence to hear the lectures on Aristotelian logic and natural philosophy that would fit him for his medical studies. Though Ficino retained a lifelong interest in medicine, he eventually left the university without taking his degree. He had discovered that his true bent was for philosophy and theology, especially the Platonic and Augustinian theology he met in his confraternity, led by the priest and theologian Lorenzo Pisano. Thanks to the indulgence of Cosimo de'Medici, Ficino was able to study Greek so as to have direct access to Plato's works, only a few of which were available in Latin at the time (see Platonism, Renaissance). Ficino's desire to return to the original Greek text was also a symptom of his ties with the humanist movement; he had enjoyed something of a classical education under two minor humanist schoolmasters, and was surrounded in later life by friends, patrons and pupils who were deeply involved in the movement for 'good letters' (see Humanism, Renaissance).

In addition to supporting his Greek studies, Cosimo de'Medici had lent the young Ficino a precious manuscript containing the complete works of Plato, and Ficino's first large translation project was a Latin version of ten dialogues of Plato, dedicated to Cosimo de'Medici a few weeks before the latter's death in 1464. Before 1469 Ficino had drafted a translation of all thirty-six dialogues in the Thrasyllan canon, though the final version was not printed until 1484. All of these dialogues were provided with short 'arguments', philosophical in character, and several were also supplied with full-scale philosophical commentaries. Ficino eventually wrote commentaries on the *Timaeus*, *Symposium*, *Philebus*, *Phaedrus*, *Parmenides*, *Sophist*, and on the mysterious passage in Book VIII of the *Republic* on the 'Platonic number'; these were published together in 1496. In addition to his work on Plato, Ficino also produced an exceptionally fine translation and commentary on Plotinus' *Enneads* (published 1492), a version of Pseudo-Dionysius (dedicated 1492), and versions of texts by the Platonists Iamblichus, Proclus, Porphyry, Synesius, Michael Psellus, Priscianus Lydus, Albinus, pseudo-Pythagoras, Speusippus and pseudo-Xenocrates (collection published 1499). Ficino's work of translation and commentary makes him by far the most important conduit for the transmission of the ancient Platonic tradition to Renaissance and early modern Europe.

Ficino was able to devote himself to his scholarly and philosophical labours thanks largely to the support of the Medici family over four generations as well as of other wealthy Florentine aristocrats. Cosimo de' Medici had given Ficino a house in Florence and a small farm near his own villa at Careggi; Cosimo's son Piero gave Ficino a brief appointment as a lecturer at the Florentine *studio*; Piero's son, the great Lorenzo, arranged for Ficino to have two small ecclesiastical benefices after the philosopher was ordained a priest in 1473 and in 1487 had him made a canon of the Cathedral of Florence. Before receiving this major benefice Ficino supplemented his income by tutoring wealthy pupils in rhetoric, philosophy and other subjects. He referred to his pupils collectively as his *gymnasium* or *academy* and, since most of his students concurrently attended the University of Florence (also called a gymnasium or academy by contemporary humanists), the confusion of terminology led later scholars to elaborate the rich fable of Ficino's 'Platonic Academy' (an expression not documented before 1638). In fact,

Ficino's closest, though informal, institutional link was with the University of Florence.

Though Ficino was not the leader of a Platonic Academy at the centre of Florentine intellectual life, his influence went far beyond what might be expected of a private scholar and teacher. Thanks to his position as a protégé of the Medicis, his own wide circle of pupils and friends, his numerous publications and an extensive, Europe-wide correspondence, Ficino became the leader of a philosophical counterculture that challenged in a small but significant way the dominance of Aristotelian school philosophy (see Aristotelianism, Renaissance). Ficino saw himself as an educational and cultural reformer. A sincere Christian, he believed that religious belief in his day was under threat from the growing estrangement of piety from philosophy. On the one hand were priests and other religious authorities, too ignorant of philosophy to defend Christianity; on the other hand were impious university philosophers, chiefly those whom Ficino labelled the 'Averroists' and 'Alexandrists' (that is, followers of Averroes' and Alexander of Aphrodisias' interpretations of Aristotle's psychology), who denied the ability of philosophy to prove central tenets of the faith like the immortality of the soul. In Ficino's view the great medieval project to integrate Christianity and Aristotelian philosophy had ended in intellectual disaster. But Ficino believed the best way to combat the growing autonomy of philosophy from religion in the schools was neither to retreat to fideism nor to seek a more successful Christian interpretation of Aristotle, but to replace Aristotle with Plato as the primary philosophical authority of Christendom. It was Ficino's belief that Plato, who had believed in creation and in the immortality of the soul, would provide a better foundation for Christian belief than Aristotle, who had believed in the eternity of the world and had been fatally unclear on the immortality question. In this Ficino was supported by the authority of Augustine, who in a much-quoted passage of *De civitate Dei (The City of God)* had declared Plato to be the pagan philosopher closest to Christianity. Indeed, Ficino (who also thought himself to have prophetic powers) declared that he had personally been appointed by divine providence to bring about a rebirth of Platonic theology in order to save the Christian faith from impious intellectuals.

Ficino's other sharp difference from contemporary scholasticism was his interest in the therapeutic side of ancient philosophy. This interest grew out of his early medical training, which helped him recognize the close connection between medicine and philosophy in Plato, Aristotle and the Hellenistic philosophers. Psychic health for Ficino involved both the cultivation of moral virtue and the achievement of a proper equilibrium between states of the body and states of the soul. The former theme is mostly explored in Ficino's letters; the latter in his major work on magic, the *De vita (On Life)*. In this work Ficino tries to find magical remedies for scholar's melancholy, in particular psychosomatic remedies that work on the *spiritus* - the *tertium quid* linking soul and body. It was once believed on the authority of Frances Yates that the sources of Ficino's magic were to be found in Hermes Trismegistus, but this has recently been shown to be an error; Ficino's actual sources were the same late ancient Platonic texts that guided his interpretation of Plato (see Hermetism).

2 The 'ancient theology'

Ficino's real interest in 'Thrice-Great Hermes' was theological rather than magical. Ficino believed that the texts going under the names of Hermes Trismegistus and Orpheus, as well as the Chaldaean Oracles which he (following Pletho) attributed to Zoroaster, were theological writings of extreme antiquity, belonging roughly to the time of Moses. (In fact they were late ancient forgeries.) For him, they represented a tradition of gentile theology, parallel to the Hebrew Old Testament, that culminated in the writings of Plato. Like the Old Testament, they were inspired but obscure writings whose full meaning only became clear with the advent of Christ. Following Eusebius and Lactantius, Ficino held that the writings of the ancient theologians had prepared the gentiles for Christianity as the Old Testament writings had prepared the Jews. In Christian times the writings of the pagan philosophers and theologians in the Platonic tradition retained value for a variety of reasons. They provided a model for the kind of *pia philosophia* or *docta religio*, combining religious belief and philosophical wisdom, that Ficino wished to see revived in his own time. If Platonism could be successfully reconciled with Christian faith, the latter's credibility would be much enhanced among people educated by humanists for whom ancient authority was paramount. Platonism could also act as an introductory credo preparing the philosophically minded for the higher truths of Christianity, as it had in the case of Origen and Augustine. It could serve as an apologetic weapon against sceptical intellectuals: Ficino said as much in a letter praising Pico della Mirandola as a 'fisher of men' for having used Plato as a net to draw 'Averroists and Epicureans' back to Christianity.

It may be asked what could have led Ficino and his circle to promote so unusual a view of the role of ancient

theology and Plato within Christianity. It must be remembered that the efforts of those in the Renaissance movement to revalue all things classical led to a certain cognitive dissonance between classical and Christian values. While most Christian writers in antiquity were anxious to distinguish Christianity from the surrounding pagan culture, in the Renaissance many humanist writers wished to emphasize the common ground between Christian doctrine and the best pagan thought. Ficino's interpretation of the historical role of Platonism integrated the greatest of ancient philosophers into the Christian tradition, and strengthened the humanist hope that Christendom could renew itself from ancient sources without alienating itself wholly from pagan culture. The 'ancient theology' also presupposed Ficino's wider belief in natural religion: that religion was natural to all men, and that all manifestations of religion were in some degree good as expressions of the natural desire of man for God. Though Ficino did not declare all religions equal - he held that each species of belief should be arranged hierarchically with Christianity holding the first place in the genus - his attitude to religions other than Christianity stands in marked contrast with older medieval attitudes. While traditional church teachings declared Islam, for example, to be a demonic invention or a divinely-ordained scourge of sinful Christians, Ficino (like Nicholas of Cusa) regards Islam as a sincere though misguided form of worship. Ficino's conception of natural religion and the 'ancient theology' continued to retain a certain appeal throughout the later Renaissance; it has been shown that as late as the seventeenth century the Jesuits in China were attempting to convince their catechumens that the 'ancient theology' of the Chinese was a foreshadowing of the truths of Christianity.

3 The immortality of the soul

The question of the soul's immortality was perhaps the most hotly debated philosophical issue of the later fifteenth and early sixteenth century. After a long period in which 'the common doctrine of the philosophers' (that is, Averroism) had reigned almost unchecked in Italian universities (see Averroism), the 1470s saw a revival, in the religious orders and among secular thinkers like Ficino and Apollinaris Offredi, of attempts to establish rational proofs for the immortality of the soul. The campaign culminated with the Fifth Lateran Council (1512-7), summoned by Ficino's former pupil Leo X, which denounced 'those who assert that the intellective soul is mortal or is one for all mankind'. Ficino, like Thomas Aquinas and many others who argued for immortality, held that those who denied personal immortality were undermining the traditional belief in rewards and punishments in the afterlife, and thus removing a key sanction against immoral behaviour. In his argument to the tenth book of Plato's *Laws* Ficino went so far as to say that the immortality of the soul was the main foundation for religion.

This historical background does not however account fully for Ficino's preoccupation with human immortality. Ficino was the first philosopher to give the immortality of the soul the central place in his thought, a prominence indicated by the full title of his principal work, *Theologia platonica de immortalitate animae (Platonic Theology, On the Immortality of the Soul)* (1474). In his classic study of Ficino's thought (1943), P.O. Kristeller maintained that immortality was central to Ficino's work because of its close connection with contemplative experience. For Ficino, the experience of God which may be attained in contemplation constitutes the highest human act of consciousness, and it therefore both defines the essence of humanity and establishes the end of human existence. Since the contemplative experience of God in this life is only partial and transitory, the soul must be capable of some form of separate incorporeal existence in which its natural appetite for the knowledge and enjoyment of God may be fulfilled. Ficino does not seem to realize that this is at best an argument for the soul's survival after death and not necessarily for eternal existence, since he admits elsewhere that souls are created in time. But in fact, many of the dozens of immortality arguments that fill the last thirteen books of the *Theologia platonica* begin from similar subjective analyses of acts, habits, faculties, appetites and affinities of soul. The arguments from affinity, drawn in the first instance from Plato's *Phaedo*, are of particular importance, but Ficino also employs the argument from self-motion found in the *Phaedrus*, while the arguments from *appetitus naturalis* have Augustinian and Thomistic antecedents.

The immortal soul is also central to Ficino's philosophy in a broader metaphysical context. The early books of the *Theologia platonica* lay out an ontological hierarchy of five substances, God, angel, soul, quality and matter. This hierarchy was probably taken from Proclus, though the hypostasis of quality seems to be original with Ficino. Within the hierarchy soul functions as the central link: what is above soul is eternal, immaterial, unchanging, intelligible; what is below it is temporal, material, mutable and sensible. It is soul that binds the two spheres together and makes them a unity. Paradoxically, the unifying functions of soul within total metaphysical reality mean that the soul is radically divided within itself. It contains within itself two separate and opposing impulses. It

has a natural desire for God which drives it to cut itself off from the body and empirical reality, to turn within and upwards to the source of its being through rational activity. In addition to this contemplative nisus, obviously inspired by Plotinus, Ficino posits another which leads the soul to ‘care for’ lower things such as the body, for which it has a natural affection. To these two natural tendencies or affections there correspond the higher parts of the soul, pre-eminently the reasoning and noetic powers, and the lower parts of the soul such as sensation and vegetation which are responsible for its empirical activity.

Ficino’s definition of the soul, partly in consequence of this radical division within the soul, is not entirely satisfactory. In some passages he asserts, following Aristotle and Aquinas, that it has a hylomorphic relationship to the body, that is, it is the substantial form of the body. He rejects the Plotinian formulation of the relation of soul to body, in which the soul, while remaining separate from body, controls it by means of a *physis* or reflection of itself which it projects into the body. He also will not endorse the implausible solution of some medieval Augustinians, which calls for the soul to be a distinct substance, though composed of form and ‘spiritual matter’. Yet in most contexts Ficino does speak of the soul in Platonic terms as though it were an independent substance and not subject to material potencies. He infers from the fact that we form simple concepts and can conceive of pure simplicity that the soul itself is simple; he uses many of the old Platonic analogies, such as that the soul is imprisoned in the body, that the soul is to the body as the person at the helm is to the ship, and so forth.

Plato’s doctrine of the pre-existence and transmigration of souls presented Ficino with a major interpretative challenge, since it threatened the Florentine’s larger project of demonstrating the compatibility of Platonism and Christianity. The doctrine had been confidently attributed to Plato by Plotinus, Augustine, the standard commentary on the Bible (where King Herod is also said to have believed in it) and Thomas Aquinas. Several of Ficino’s contemporary opponents, such as the Dominicans Savonarola and Dominic of Flanders, used it to discredit Ficino’s Platonic revival and the doctrine was, significantly, condemned by the Inquisition in articles published at the University of Pisa in 1490. Ficino’s response was to deny that Plato had ever really held the doctrine. Metempsychosis as referred to in Plato and the other ancient theologians was to be understood as a mystery; to understand it in a literal sense was a vulgar error first put about in the late Academy. In reality the doctrine of transmigration must be taken as an allegory of the return of the soul to the One in contemplative experience, or typologically as a prophecy of the resurrection of the body, or as an obscure, proto-Christian premonition of the doctrine of purgatory. Ficino also employed the not wholly consistent argument that when Plato discussed transmigration in his works he was simply retailing a Pythagorean doctrine to which he was not himself necessarily committed. To the metaphysical problem of explaining how an eternal substance could have been created in particular souls at particular moments of time, Ficino argues that creation in this instance is to be understood as the ontological dependence of the temporal manifestations of soul on their eternal source, not as the production *ex nihilo* of new substances in time.

4 Platonic love

If the *Theologia platonica* was Ficino’s most substantial independent work of philosophy, his most influential work was his commentary on Plato’s *Symposium*, known as *De amore (On Love)* (1469). Unlike Ficino’s other commentaries, the *De amore* was cast in the form of a literary dialogue, set in the villa of Lorenzo de’Medici, with Ficino’s friends and patrons as the interlocutors. Each interlocutor gives a speech which is effectively a Neoplatonic reading of the several speeches in Plato’s *Symposium*. It was this work, and translations of it into Italian, French and German, that popularized the concept of ‘Platonic love’, a concept that became a popular poetical conceit in the later Renaissance and is still used in a debased sense in modern colloquial speech (see Love).

Ficino is usually credited as the inventor of this concept, and the expression *amor platonicus* actually occurs in one of his letters (though not in the *De amore*). Ficino’s account of love, however, is closely based on Plotinus (in particular *Enneads* 3.5), and a similar Plotinian reading of the *Symposium* can be found in Cardinal Bessarion’s *In Calumniatorem Platonis (Against Plato’s Calumniator)*, printed within a few months of the publication of Ficino’s *De amore* in 1469 (see Platonism, Renaissance §3). Nevertheless, it was certainly Ficino who gave the concept its currency in Renaissance Europe and invested it with the philosophical richness that gave it its wide appeal. As Kristeller (1943) points out, the concept combines a Plotinian reading of love with the will of St Augustine, the charity of St Paul, and ideas on friendship found in Aristotle, the Stoics, and Cicero’s *Laelius*.

Ficino's basic move is to interpret our experience of love in terms of the spiritual dynamics of the Neoplatonic cosmos. A true experience of love awakens one to the natural desire of the soul for union with God. It may begin with a sensual element but that is a mere preparation for genuine love, which is the love of God. The instantiations of beauty or goodness that kindle mutual desire between human beings are to be understood as reflections of the divine beauty and goodness. What we love in others rightly belongs to God; to give love to another without at the same time giving love to God, as Ficino says in a striking formulation, is 'nothing but robbery'. Yet the true basis of active love is not the unconscious dependence of attributes on their divine source, but a conscious striving of souls together towards God in contemplative experience. It is the active search for truth in the philosophical life which is the true basis of love and forms a genuine union between lovers. Real, divine love is thus independent of the sex of the lovers and can exist between members of the same or opposite genders. Ficino's concept of love in this way subsumes the Pauline and Augustinian concept of charity; it also absorbs the classical pagan concept of friendship. In the *Nicomachean Ethics*, for example, Aristotle argues that true friendship is necessarily between equals and has as its subject common pursuits. Ficino understands this to mean that souls united in contemplation of the same object are *eo ipso* equal. Such souls are always present to each other even when separated, and love even has the power to transform the lover into the image of the beloved.

Ficino insists that the biblical command to love one another has a metaphysical basis; he argues that unrequited love is, so to speak, spiritually defective. Mutual love which constitutes a concrete communion between persons is the only true and perfect form of love; it is not only a moral obligation but a cosmic necessity. If love is based on a similarity or equality between the souls of lovers and has the same divine source, then it must exist in both souls equally. A failure of charity is a denial of one's essential nature. It has recently been suggested that Ficino's emphasis on Platonic love has a political meaning, that it was meant as a cure for the endemic divisions in Florentine civil society. It has also been argued that Ficino feared criticism of Plato on account of the numerous scenes of homosexual gallantry depicted in the dialogues, and that the doctrine of Platonic love was in part intended as an exegetical device to protect Plato from this charge. Both statements may well be true. But the doctrine of Platonic love is one that grows naturally from the central themes of Ficino's philosophy, especially his emphasis on the special dignity of contemplative noesis among human cognitive powers and his belief in the unitive functions of soul within creation.

JAMES HANKINS

List of works

Ficino, M. (1433-99) *Opera omnia (Complete Works)*, Basle: Heinrich Petri, 1576; repr. Turin: Bottega d'Erasmo, 1959.(The only widely available edition for many of Ficino's Latin works; most of those not included here are given in Kristeller's *Supplementum Ficinianum*.)

Ficino, M. (1469) *De amore*, ed. and trans. R. Marcel, *Commentaire sur le Banquet de Platon*, Paris: Les Belles Lettres, 1956; trans. S. Jayne, *Commentary on Plato's Symposium On Love*, Dallas, TX: Spring Books, 1985. (Referred to in §4. Marcel's edition gives the Latin text with French translation; Jayne has a useful introduction describing the influence of *De amore* on Renaissance literature.)

Ficino, M. (1474) *Theologia platonica de immortalitate animae (Platonic Theology, On the Immortality of the Soul)*, ed. and trans. R. Marcel, *Théologie platonicienne de l'immortalité des âmes*, Paris: Les Belles Lettres, 1964-79, 3 vols.(Referred to in §3. Edition of the Latin text with a French translation; the third volume also contains most of Book 2 of Ficino's *Letters*.)

Ficino, M. (1489) *De vita libri tres*, ed. and trans. C.V. Kaske and J.R. Clark, *Three Books On Life*, Binghamton, NY: Center for Medieval and Early Renaissance Studies, 1989. (Referred to in §1. Critical edition of the Latin text of the *De vita* with English translation and notes.)

Ficino, M. (1496) *Commentaria in Platonem (Commentaries on Plato)*, Florence: Lorenzo di Francesco da Venezia; ed. M.J.B. Allen, *The Philebus Commentary*, Berkeley, CA: University of California Press, 1975; *Marsilio Ficino and the Phaedran Charioteer*, Berkeley, CA: University of California Press, 1981; *Icastes: Marsilio Ficino's Interpretation of Plato's Sophist*, Berkeley, CA: University of California Press, 1989; *Nuptial Arithmetic: Marsilio Ficino's Commentary on the Fatal Number in Book VIII of the Republic*, Berkeley, CA: University of California Press, 1994. (The 1496 edition is the final Latin text of the commentaries; now largely superseded by M.J.B. Allen's critical editions of the Latin text, which also provide English translations, monographs and notes.)

Ficino, M. (1937) *Supplementum Ficinianum: Marsilii Ficini… opuscula inedita et dispersa*, ed. P.O. Kristeller, Florence: Olschki.(Contains most of the Latin works not included in Ficino's *Opera* of 1576; gives textual improvements to, and the textual history of, many of the works included in the *Opera*.)

Ficino, M. (1975-88) *The Letters of Marsilio Ficino*, trans. by Members of the Language Department of the School of Economic Science, London: Shepheard-Walwyn, 4 vols to date. (Referred to in §1. English translation of the first five of Ficino's twelve books of philosophical letters.)

Ficino, M. (1990) *Lettere. I. Epistolarum familiarium liber I (First Book of Familiar Letters)*, ed. S. Gentile, Florence: Olschki.(Referred to in §1. Critical edition of the Latin text of Book I of Ficino's *Epistolarum familiarium*, with important biographical material in the introduction.)

Marcel, R. (1958) *Marsile Ficin*, Paris: Les Belles Lettres.(The standard biography, not very critical.)

Fiction, semantics of

Taken at face value, 'Anna Karenina is a woman' seems true. By using Tolstoi's name 'Anna Karenina' and the predicate 'is a woman' we appear to refer to the character Anna and to attribute to her a property which she has. Yet how can this be? There is no actual woman to whom the name refers. Such problems of reference, predication and truth also arise in connection with representational art and with beliefs and other attitudes.

Meinong distinguishes the 'being' of objects (including fictional objects) from the 'existence' of actual objects such as Napoleon. 'Anna Karenina' refers to a concrete, particular, nonexistent object that has the property of womanhood. However, Meinong's distinction seems to many ontologically suspect. Perhaps, then, being is existence and 'Anna Karenina is a woman' is actually false because 'Anna Karenina' has no referent. Russell in 'On Denoting' (1905) agrees. But how can we explain the apparent contrast in truth between this sentence and the unquestionably erroneous 'Anna Karenina is from Moscow'? Or is it that being is existence but 'Anna Karenina' refers to an abstract, not a concrete, thing - an existent, abstract thing that does not have the property of being a woman but has merely the property of being said, by Tolstoi's novel, to be a woman? Then, however, the meaning of our sentence about Anna no longer parallels that of 'Emily Dickinson is a woman'. Perhaps, as many argue, we only pretend that 'Anna Karenina' refers and that the sentence is true. This position may not adequately explain the intuitions that support Anna Karenina as a genuine object of reference and predication, however.

1 Meinongian and abstract-object views

Meinong distinguishes the 'being' of objects (including fictional objects) from the 'existence' of actual objects such as Napoleon. Although Meinong's position at first blush respects our face-value understanding of sentences about fiction, it encounters difficulties (see Meinong, A.). Fictional characters normally are incomplete: it is not true, according to the novel, that Anna is right-handed; and it is not true, according to the novel, that Anna is not right-handed. Yet how, without violating the law of excluded middle, can there be such a thing? Again, some fictions are inconsistent: in a story, a wood sprite squares the circle. Does the realm of being then include an object that infringes the law of contradiction?

Contemporary Meinongians suggest answers to such difficulties. Thus Parsons (1980) distinguishes sentence negation ('*x* is not *P*') from predicate negation ('*x* is non-*P*'). He correlates existent objects one to one with the sets of ordinary properties that they have and extends the correlation by introducing nonexistent objects as entities that are correlated one to one with the sets of ordinary properties that are not correlated with existent objects. No object is contradictory, that is, no object satisfies a formula of the form '*x* is *F* and not (*x* is *F*)'. But objects may have impossible properties - for example, being *P*-and-non-*P* - without implying the truth of any contradictions. (Such objects are impossible objects and cannot exist.) Objects also may be incomplete without violating excluded middle: the lack both of being-*P* and of being-non-*P* does not contradict the fact that an object either is *P* or is not *P*.

Such theories show that Meinongian views can be defended with far more plausibility than has been thought by philosophers heavily influenced by Russell's and others' identification of being and existence. Nevertheless, these views do not easily capture all aspects of sentences relating to fiction. For one thing, there are problems specific to particular Meinongian approaches. Thus in Parsons' theory, as in non-Meinongian theories that regard characters as collections of properties (for example, Wolterstorff 1980), it is difficult to allow that a novel may introduce two distinct characters assigned the same properties. Again, our epistemic situation and that of Sherlock Holmes are relevantly similar: Holmes senses and reasons about objects in the world, and so do we. How then can we know (as we do) that we exist, given that he - a nonexistent thing - cannot know that he exists? For another thing, the 'face-value' understanding just sketched of sentences relating to fiction - in which in saying 'Anna Karenina is a woman' we state a truth, refer to the character Anna, and attribute to her the property of womanhood - is over simple.

Thus although 'Anna Karenina is a woman' may be true *in the story*, so also is 'Anna Karenina exists'; and if we grant that the same character may occur in different stories and be described contradictorily by them, then it may be true that the character both is *P* (in one story) and is not *P* (in another story). On pain of contradiction, Meinongians cannot understand such claims as together implying that objects both have and do not have the

relevant properties. Complex Meinongian treatments of these claims can be devised. But it seems simpler to allow story-relative properties and then take fictional names to designate abstract, but existent, things that have properties such as being-*P*-according-to-story-*s* and being-not-*P*-according-to-story-*t* without having the non-relative properties of being-*P* and of being-not-*P*. We can thus proceed without having to introduce mysterious Meinongian nonexistent, particular things at all. As discussed in §§2-3 below, there are still further alternatives to considering claims relating to fiction as simple, literal truths in which objects of reference are assigned properties. Many writers would say that unless all these alternatives fail, it is unreasonable to commit ourselves to the perplexities of the Meinongian approach.

The one alternative that is clearly unsatisfactory is the unsupplemented Russellian view that a claim such as ‘Anna Karenina is a woman’ is false (or lacks truth-value, as Fregeans hold). Perhaps such a claim, taken on its own, is indeed false (or expresses no proposition at all, given direct-reference theories of proper names). But such a view leaves unexplained the contrast between that claim and ‘Anna Karenina is from Moscow’. Nor does it explain our inclination to ascribe truth to further claims such as ‘Sherlock Holmes is a fictional detective’, ‘Odysseus is the same as Ulysses’ and ‘Sherlock Holmes is far more famous than any real detective’ (Howell 1979; Parsons 1980; van Inwagen 1977). Unsupplemented Russellian views suggest nothing about the semantic or pragmatic factors which may enter into the understanding and acceptance of these further claims. (With qualifications, a similar point also holds for proposals such as that made by Woods (1974) to understand the truth of claims about fiction by appeal to the specific words or sentences that actually occur in the fictions themselves.)

The abstract-existent-object position allows for the further claims just noted, and that fact together with its non-Meinongian way of accepting genuine fictional entities makes it attractive. In van Inwagen’s version of this position, characters of fiction are theoretical entities of literary criticism. Sentences in a work of fiction that describe a character must be distinguished from our own sentences about that character. As part of the novel, Tolstoi’s sentence ‘Anna took the tray’ is not about anything, expresses no proposition, is not used by Tolstoi as a vehicle of an assertion. But my description of the novel, using the same sentence, expresses a true proposition about Tolstoi’s character: the proposition that the property of taking a tray is ascribed to that character in *Anna Karenina*. Like all entities, that character exists and obeys the laws of excluded middle and of contradiction. The evidence for the existence of characters is provided by sentences such as ‘Anna is the principal character of *Anna Karenina*’ or ‘There is a character in a nineteenth-century novel who is presented in greater physical detail than are any characters in eighteenth-century novels’. We accept these sentences as true, and it seems impossible to paraphrase them in ways that say the same thing yet involve no quantification over characters. Yet these and other sentences can be straightforwardly represented using van Inwagen’s apparatus: ‘Anna Karenina has the property of being the principal character in *Anna Karenina*’; or (roughly) ‘There is a character *c* and a nineteenth-century novel *n* such that there are properties ascribed to *c* in *n* and some of those properties imply more physical detail than any properties ascribed to any characters in any eighteenth-century novels’.

The abstract-existent-object theory provides the most plausible account so far that recognizes genuine fictional objects without accepting Meinongianism. But the theory has never been presented in full detail. Moreover, as used by us the name ‘Anna Karenina’ (unlike ‘Emily Dickinson’) is not the usual proper name that, according to direct-reference theories of proper names, refers directly to its bearer through an initial act of baptism. Rather, we refer to the theoretical entity via the name ascribed to it in the novel. As noted, we also attribute to this entity the property of having the property of womanhood ascribed to it in the novel, rather than the simple property of womanhood. Yet the theory by itself offers no particularly plausible explanation why, when we are really treating Tolstoi’s character in this way, we none the less use language appropriate to the reference and predication that concern ordinary concrete particulars (‘Anna Karenina is a woman’).

2 Pretence and make-believe

Instead of directly attacking questions about fictional reference, predication, truth and ontology, perhaps we should focus on the fictional use of language. Clearly (to ignore issues about fictional names), sentences in fiction or about characters in fiction are not distinguished from ordinary literal sentences by special lexical meanings or grammatical constructions. Like ordinary literal sentences, such sentences also may be true (as are various of Tolstoi’s claims about Napoleon in *War and Peace*) and may be vehicles of assertion (as, again, are various of Tolstoi’s claims). Perhaps, however, as some speech-act theorists have suggested, fictional claims are specially

marked out by their use in communication, for example, by possessing a special illocutionary force (see Speech acts §1).

In one version of this suggestion, in producing fiction the author performs no new illocutionary act analogous to ordinary acts of asserting, questioning or requesting. Instead, authors pretend, in a non-deceptive way, to perform such acts; for example, pretend to be making assertions about events of which they have knowledge. This suggestion fails, for not all pretences to assert produce fiction (for example, putting on an illustrative performance of making a silly claim), and not all productions of fictional sentences are pretences to assert (typing out one's story and mailing it to a publisher).

In another version of the suggestion, the author performs a special new sort of illocutionary act. For example (as Currie (1990) proposes), the author produces sentences with the intention that the audience will *make believe* the content of those sentences (that there is someone named 'Anna Karenina' who is a woman, and so on) through the audience's recognition of the author's intention. Like other pretence and make-believe approaches (including Walton's, described below, which has influenced Currie), this suggestion explains why both Tolstoi and we produce the sentence 'Anna Karenina is a woman' even while we recognize that 'Anna Karenina' denotes no actual person. We do so because that sentence gives the content that we are to make believe is true. (Because the sentence mimics claims describing real persons, we can also easily use it in making believe that there is a real person whom it truly describes.) One might object that the notion of fiction includes nonlinguistic items such as representational paintings and sculptures as well as sentences. However, its defenders argue that the preceding suggestion can be generalized to cover such items.

A deeper objection derives from Walton's nonlinguistic theory of fiction. For Walton (1990), individuals and groups play games of make-believe, the rules of which require the participants to imagine various matters to be true. Props generate fictional truths in such games. (Thus in a game in which the rule is that stumps are to be imagined to be bears, a stump by its presence generates the fictional truth that a bear is present.) Fictions - including linguistic fictions, representational paintings and sculptures - serve as props in games of make-believe. A text constitutes a fiction when, roughly, there is a rule in force that we are to make believe that there are objects such that the words of that text refer to and describe those objects. (Thus we make believe that 'Anna Karenina' is a genuine proper name that directly refers to a Russian woman of whom the story is telling us, and so on.) In Walton's account, the fact that words constitute a fiction depends on their thus being a prop in a game of make-believe, not on the fact that an author intends the audience to make believe that the propositional content expressed by the words is true. For Walton, fiction has nothing special to do with communicative acts of intentional agents; naturally occurring cracks in a rock can spell out a story.

These last points are controversial. (Perhaps the cracks are only treated by us as fiction, without really being so, as Currie argues.) But the basic idea, developed in detail by Walton, that our claims about fiction are to be understood in terms of make-believe provides a deep, powerful explanation of much that concerns those claims. Quite possibly, and as both Walton's and Currie's views suggest, we only make believe that through Tolstoi's sentences about Anna Karenina we get genuine reference, predication and truth.

3 Further questions

Nevertheless, questions remain: about the content of our make-believe, about non-make-believe claims concerning fiction, and about ontology. If we make believe that 'Anna Karenina is a woman' is true, what exact proposition do we make believe is true? If in a piece of literary criticism I assert that Anna is from St Petersburg - or if I compare her with real persons or with other characters ('Anna Karenina is a stronger, more developed personality than is Theodor Fontane's Effi Briest') - then I seem to be stating a sober, literal truth rather than simply making believe that something is true. If you and I independently remark that Tolstoi's character Anna is from St Petersburg, our remarks seemingly concern the selfsame character. But how can they, if, without having any particular object in mind, we each independently merely make believe that 'Anna Karenina' is a genuine name that refers to some real entity?

Writers such as Walton and Currie suggest somewhat different answers to such questions. Common to their answers, however, is the view that the most we can make believe - in propositional content - is the existential general claim that there is a woman who is named 'Anna Karenina', and so on. We cannot literally make believe *of*

a concrete, particular fictional character that *it* is so-and-so because, actually, there are no such characters. This last point can be supported by an argument of Kripke's in *Naming and Necessity* (1980). Our make-believe is not *of* any actual, concrete, particular entity genuinely referred to by 'Anna Karenina'. Nor (to ignore inconsistent fictions) can it be *of* any purely possible thing that exists in all the possible worlds compatible with what is said in the novel and is picked out from each such world by the properties that the novel assigns to Anna. There is no way to decide which of the many possible entities that have all those properties is the unique, particular referent of the name.

Again, writers in the make-believe tradition may understand our non-make-believe claims to indicate or allude to practices of make-believe. Thus, as Walton suggests, my sober, literal assertion that Anna Karenina is from St Petersburg may in effect claim that to say such a thing in the appropriate game of make-believe is fictionally to speak truly. Finally, when both you and I independently talk of Anna Karenina, or when I compare Anna Karenina to Effi Briest, then, Walton urges, we engage in a shared game of make-believe, or I simply combine the games individually appropriate to *Anna Karenina* and *Effi Briest*. (About such literal assertions and comparisons, Currie offers somewhat different treatments, involving what he holds are further, 'metafictive' and 'transfictive' uses of fictional names.)

Some of these suggestions may succeed. But in the end they deny that there can be a single fictional character - a single entity created by the author - that in actual fact two people independently refer to and describe. They also turn out to deny that it is literally and actually true that one and the same character - one single entity - can occur in different works of fiction (or can be the common focus of different games of make-believe; or of different dreams, illusions and beliefs). If we take seriously the idea that there actually are such characters of fiction, then we are forced back into accepting characters as objects of genuine reference and true predication. If so, then unless some Meinongian or similar view is adopted, it seems that we should combine the abstract-existent-object theory with the make-believe approach. Or perhaps (swallowing popular objections to Lewis's modal realism) we should accept a version of Lewis's counterpart theory (see Lewis, D.K.). We might hold, for example, that 'Anna Karenina' refers to various concrete, particular, non-actual individuals that exist in the possible worlds in which Tolstoi's novel is told as known fact. Those would be the individuals that have all the properties the novel attributes to Anna and that (while not strictly identical to one another) are enough alike to function as counterparts (see Modal logic, philosophical issues in §4). It remains to be seen, however, whether these proposals, or any other ideas for countenancing genuine reference to and predication of characters of fiction, can be successfully defended.

Fictional entities

By 'fictional entities', philosophers principally mean those entities originating in and defined by myths, legends, fairy tales, novels, dramas and other works of fiction. In this sense unicorns, centaurs, Pegasus, the Time Machine and Sherlock Holmes are all fictional entities.

A somewhat different category of fictional entities is associated with empiricist philosophy. It includes entities apparently assumed by common discourse but which admit of no direct empirical experience. Thus Jeremy Bentham classified as 'fictitious entities' motion, relation, power and matter, as well as, notoriously, rights, obligations and duties. David Hume called substance, the self, even space and time 'fictions' andBertrand Russell thought ordinary things, such as Piccadilly or Socrates, were fictions, on the grounds that they are 'constructed' out of simpler, more immediate objects of acquaintance.

Philosophical interest in fictional entities thus covers a surprisingly wide area of the subject, including ontology and metaphysics, epistemology, logic, philosophy of language, and aesthetics. The first question that arises is how the distinction should be drawn between fictional and nonfictional entities. As the examples from Bentham, Hume andRussell show, this is by no means a straightforward matter. The next question concerns what to do with fictional entities once they have been identified. Here the primary philosophical task has been to try to accommodate two powerful yet apparently conflicting intuitions: on the one hand, the intuition that there are no such things as fictional entities, so that any seeming reference to them must be explained away; on the other hand, the intuition that because 'things' like Sherlock Holmes and Anna Karenina are so vividly drawn, so seemingly 'real', objects of thoughts and emotions, they must after all have some kind of reality. Broadly speaking, we can discern two kinds of philosophical approach: those which incline towards the latter intuition, being in some way hospitable to fictional entities; and the less hospitable kind, which incline towards the former and seek only to show how fictional entities can be eliminated altogether in the strict regime of rational discourse.

1 Distinguishing the fictional from the nonfictional

It might be supposed that what determines whether an entity is fictional or not is whether it exists. Perhaps fictional just means nonexistent. Certainly it is commonplace to contrast what is fictional with what is real. The crucial difference between Socrates and Sherlock Holmes is that the one existed and the other did not. The trouble comes when we find serious philosophers, such as Russell, describing even beings like Socrates as 'fictions'. That invites the thought that there are different kinds of fiction and even different kinds of nonexistence. If that is right it compromises any simple identification of the fictional with the nonexistent. Also philosophers in the twentieth century have become increasingly wary of unqualified talk about what exists and what does not. Among logicians and philosophers of science there has been a pronounced shift away from asking what entities exist (or are real) towards asking what entities particular theories are committed to. Underlying this shift and acting as a constraint on theory construction is the heuristic principle called Ockham's razor (after the medieval logician William of Ockham), namely 'Do not multiply entities beyond necessity'.

In seeking to refine the association of the fictional with the nonexistent it is helpful to distinguish the role of fictional entities in logic, epistemology and literary narrative. There is no compulsion to suppose that some uniform account of fictional entities must span these three applications. Indeed it becomes evident that different criteria for distinguishing the fictional from the nonfictional operate in each case.

First of all, fictions in logic are most commonly associated with eliminability by logical paraphrase. The idea is roughly this: that a fictional entity is the purported referent of an eliminable singular term. It relies on a distinction between apparent reference and genuine reference; the object of a genuine reference must exist, or be assumed to exist by a theory, while apparent but non-genuine reference is that which is eliminable by paraphrase without loss of content. The conception probably originated with Bentham, who thought that rights, for example, were fictitious entities, precisely because sentences containing 'rights' as a noun (such as 'The people demanded their rights') can be paraphrased into sentences in which no such noun or singular term appears (such as 'The people demanded fair treatment under the law'). As long as the paraphrase captures the significant content of the original it shows that the apparent reference in the original (to a specific class of entities) is not a genuine reference: thus are the entities 'fictional'.

Bentham's theory was a clear forerunner of the school of twentieth-century logical analysis epitomized by such philosophers asBertrand Russell, Rudolf Carnap and W.V. Quine. Russell's Theory of Descriptions eloquently showed that singular descriptive phrases, such as 'the highest prime' or 'the golden mountain', do not need to function logically as naming expressions (that is, having, in our earlier terminology, 'genuine reference') in order to be meaningful (see Russell, B. §9). Quine extended the thesis to all singular terms, including proper names, arguing that each is eliminable by logical paraphrase, in favour of quantifiers and predicates. Only bound variables, for Quine, are the true bearers of referential commitments (see Quine, W.V. §5). We will return to Russell's and Quine's theories in the next section, for they have been highly influential in deflationary accounts of fictional entities.

While fictions in logic connect with reference and paraphrase, fictions in epistemology rest on the idea of 'construction'. Ordinary objects can be thought of as fictions, in epistemological theories, just to the extent that they are thought of as 'constructed' (by the human mind) out of more basic, perhaps more real, elements. A characteristic kind of empiricism equates what is real with what is knowable and what is knowable with what is given in experience. For those empiricists who hold that the only immediate objects of experience are subjective entities like 'impressions' (Hume) or 'sense-data' (Russell), it is a short and natural step to the idea that enduring objects in space and time are mere 'constructs' or posits of the mind that round out the flux of experience. Quine, albeit rejecting any privileged foundation of knowledge, has famously compared physical objects with the gods of Homer and spoken of both as 'myths'.

No doubt for those who think of fictional characters in legend or literature as paradigmatic fictional entities, it will seem tendentious, even paradoxical, to describe physical objects as 'fictions'. However, etymology associates fiction more with 'making' or 'feigning' than with nonexistence and empiricist epistemologists can be taken to be emphasizing the different kinds of 'making', or imaginative invention, involved in human knowledge.Nelson Goodman has described knowledge itself as a species of 'worldmaking'. None of these philosophers wants to collapse the distinction between a fictional character, in the familiar literary-critical sense, and a real person.

So what sets apart the characters of literary narratives from the 'fictions' in logic and epistemology? One common idea is that fictional entities such as the Time Machine and Sherlock Holmes are logically rooted in the narratives in which they are first introduced; their very conception derives from the descriptive content of those narratives. To find out about Holmes one must read the Holmes stories. This already hints at a fundamental difference from nonfictional objects, for the latter do not derive their existence and nature from any narrative; to find out about them we must investigate the world, not merely a source text. Fictional entities of the literary type are 'made' or 'made up' precisely by being described in an act of storytelling, under the appropriate conventions. The fact that they do not exist in the real world can be seen to be as much a consequence of their origin (real objects are not made up by storytellers) as a defining feature of their fictionality.

2 Deflationary theories

The intuition that there are no such things as fictional entities, so that any apparent ontological commitment to them must be removed, is powerful among philosophers. The logical analysis of Russell and Quine provides a striking example of how such a commitment can be avoided. The eliminative strategy applied to logical fictions can be applied to more familiar literary fictions as well. When we describe the exploits of Sherlock Holmes or the properties of Pegasus we appear to be referring to, or speaking about, entities which have some kind of existence. But this is an illusion, according to deflationary theories. In fact we are not referring to any such things.

Russell's Theory of Descriptions sets the standard for deflationary theories. Suppose, regarding a character in a novel, we want to assert, 'The invisible man could see but not be seen.' For Russell, a logical analysis of our assertion would be somewhat as follows: 'There is one and only one thing that is a man, is invisible, and can see without being seen'. The latter sentence removes the apparent naming expression 'the invisible man' and asserts only that something or other satisfies a collection of predicates. The sentence turns out to be false (for there is no such thing) but is perfectly meaningful.

Quine showed that the analysis could be generalized to eliminate all singular terms, proper names included. He suggested that, from a logical point of view, names can be turned into predicates purely formally. Thus he analyses the seemingly true sentence 'Pegasus does not exist' as 'Nothing pegasizes'. By losing the troublesome singular

term ‘Pegasus’ and speaking only of the instantiation (or lack of it) of a complex, albeit artificial, predicate, the analysis neatly shows how it is possible to deny the existence of a fictional entity without incurring any ontological commitment to that entity. It is a lesson, for example, that atheists can usefully apply in their denials of the existence of God (for it might seem that even to use the name ‘God’ is to admit that there is such a being).

To the extent that the logical problem of fictional entities is that of how to discriminate apparent reference from genuine reference the Russell/Quine deflationary theory is highly effective. But it also has serious drawbacks in accounting for other intuitions concerning ordinary talk ‘about fictional characters’. For one thing it has the consequence that all sentences containing singular terms for fictional characters turn out to be false (because they involve false existence claims). Yet is there not a sense in which the assertion ‘Sherlock Holmes is a detective’ is true, in contrast, say, to ‘Sherlock Holmes is a ballet dancer’, which is clearly false? On the Russell/Quine view they are both false. What needs to be captured is the fact that the claims are *about the Holmes stories*, not about persons in the real world. What is meant is something like: ‘Within the Holmes stories, as told by Conan Doyle, Holmes is a detective (and not a ballet dancer)’. It is a further question how assertions of that kind are to be analysed. In some deflationary theories they are said to refer only to novels and their component sentences. That has the advantage that it too removes unwelcome ontological commitments, but is surprisingly difficult to sustain in practice (not least because truths about the content of fictional stories extend beyond the explicit content of the stories’ sentences: for example, it is surely true that Holmes did not travel in a rocket, though that is never made explicit by Conan Doyle).

Another drawback of the Russell/Quine view is that it fails to distinguish storytelling discourse from discourse about stories. If the sentence ‘Holmes returned to London’ occurs in a Holmes story it seems inappropriate to analyse it as a false assertion about the real world. Conan Doyle, the author, is not asserting, or attempting to assert, facts about the world; he is making up a story. If on the other hand readers report the content of the story by using the same sentence they, in contrast to the author, are making an assertion (true or false), but one about the story, and again not about the world.

There are other deflationary theories, which attempt to remove commitment to fictional entities. Two deserve particular mention. The first is that of Nelson Goodman (§2), who defends a strict nominalist ontology. Given that there are no unicorns and no centaurs, the predicates ‘is a unicorn’ and ‘is a centaur’ have the same extension, according to Goodman, namely, a null extension: the set of unicorns is identical to the set of centaurs because it is the empty set. Yet surely unicorns and centaurs are different? Goodman seeks to explain the difference, not by invoking fictional entities, but by appeal to further predicates that do differ in extension. For example, a unicorn-picture, as he puts it, is different from a centaur-picture and can be recognized as such. While normally ‘X is a picture of Y’ is a two-place predicate, relating a picture and an object (for example, a portrait and the Duke of Wellington), in ‘fictional’ cases, such as ‘This is a picture of Sherlock Holmes’, there is only a one-place predicate involved, namely ‘is a Holmes-picture’. Pictures can be sorted into ‘Holmes-pictures’, ‘unicorn-pictures’ and so on, without commitment to a separate class of ‘fictional entities’. Pictures, after all, are unproblematically real.

Another deflationary strategy comes fromKendall Walton, for whom works of fiction are ‘props in games of make-believe’. Readers of *Don Quixote* seem to be introduced to a dreamy knight, who tilts at windmills, crusades against Evil, and so forth. Furthermore, they seem to think about him, refer to him and even feel sympathy for his predicament. However, for Walton it is only make-believe that they do such things. It is all pretence; they are playing a game with the novel as prop. In Walton’s alternative idiom, ‘it is fictional that’ they describe him, refer to him and respond emotionally to him. There is not even any such proposition that Don Quixote tilted at windmills.Walton offers a systematic theory which locates all ‘relations with fictional characters’ in imaginative games; to speak ‘about characters’ is just an elliptical way of speaking about the relevant games.

3 Hospitable theories

A presupposition behind deflationary theories is that if there is no such thing as X then X cannot (literally) be referred to or spoken about. The focus in all cases is in removing the appearance of reference. Some philosophers, notably Richard Rorty, find this association between reference and ontological commitment unjustified. Referring, forRorty, is just ‘talking about’ and he claims we can talk about Holmes, the number three, the beauty of a landscape or moral values, for instance, without engaging any deep issues in ontology. Rorty views the very idea of ‘ontological commitment’ as pointless.

A more widely held view is that 'referring to fictional entities' does have ontological significance but that different kinds of *being* are involved. Fictional entities are, after all, entities. If Russell's Theory of Descriptions is the starting point for (modern) deflationary theories, then Alexius Meinong's Theory of Objects (*Gegenstandstheorie*) is the starting point for (modern) hospitable theories (see Meinong, A. §§2-4). Meinong postulated a realm of objects of which only a tiny subset are existent objects. He seems at least partially to have worked with a syntactic criterion for objecthood: any expression functioning as a singular term in a well-formed sentence designates an object. Notoriously, Meinong held that even 'the round square' denotes an object (albeit one that does not, and could not, exist in reality). Although Meinong's theory was strongly attacked byRussell, it has proved remarkably resilient, with defences by, for example, Terence Parsons and Charles Crittenden. The point, again, is not to collapse the distinction between Socrates and Sherlock Holmes but only to claim they are both objects, the one existent, the other nonexistent. An added difference, for Parsons, is that Holmes, unlike Socrates, is an 'incomplete' object, in the sense that for any given property it is not always determinate whether Holmes has that property or not. But what is to be gained by saying that *there are* nonexistent objects? Principally, it makes sense out of common ways of speaking, without the need for paraphrase: we refer to Holmes, we distinguish him from Dr Watson, we ascribe properties to him. What could be more natural than saying there is an *object* here?

Other theorists sympathetic to fictional entities attribute to them existence as *abstract* objects. Nicholas Wolterstorff has argued that fictional characters are kinds (the character Holmes is a person-kind, though not a kind of person), Peter van Inwagen views them as 'theoretical entities of literary criticism', comparable in status to plots, metres and rhyme schemes. A consequence for Wolterstorff is that characters not only exist (as kinds) but do so eternally; a writer 'selects' but does not strictly create characters, for the properties ('being a detective', 'solving mysteries', etc.) that constitute the relevant kinds are not themselves created. If fictional characters exist as abstract objects, what properties do they possess? Holmes, it seems, is a detective, yet no abstract object could be a detective. Van Inwagen responds by distinguishing those properties 'ascribed' to characters (such as 'being a man', 'smoking a pipe') that they do not literally possess and those which characters 'exemplify' (such as 'being introduced in Chapter 29', 'being wittily conceived'). The intuition that fictional characters are in some such way real is further supported by other common modes of speech, as when we say, for example, that Dostoevsky's characters are more realistic than those of Cervantes. It is difficult for deflationary theories to paraphrase away such references.

The debate about fictional entities goes to the heart of methodological issues in philosophy. It highlights the status and role of logical analysis, the nature of ontological commitment, and above all the remarkable indifference of ordinary language to philosophical worries about what does and does not exist.

Fictionalism

'Fictionalism' generally refers to a pragmatic, antirealist position in the debate over scientific realism. The use of a theory or concept can be reliable without the theory being true and without the entities mentioned actually existing. When truth (or existence) is lacking we are dealing with a fiction. Thus fictionalism is a corollary of instrumentalism, the view that what matters about a theory is its reliability in practice, adding to it the claim that science often employs useful fictions. Perhaps the fullest expression of fictionalism occurs in Vaihinger's once popular philosophy of 'as if'.

Fictionalism is allied to instrumentalism, the brand of pragmatism associated with Dewey's 'Chicago School of Thought' (see Dewey, J.; Pragmatism). There is also fictionalism in the philosophy of logic and of mathematics (see Antirealism in the philosophy of mathematics). Dewey coined the term ' instrumentalism' (sometimes also 'experimentalism') to describe his pragmatic treatment of 'how thought functions in the experimental determination of future consequences' (Dewey 1943: 463). According to instrumentalism what we look for in all the various contexts of inquiry, whether around the house or in the laboratory, is instrumental reliability; that is, we want our theories or concepts to be useful in all the practical and theoretical endeavours for which we try them out. Such usefulness or reliability does not imply that the theory is true nor that the 'entities' involved actually exist. In such a case the 'entities' mentioned by the theory are in fact useful *fictions*.

Perhaps the fullest expression of fictionalism occurs in Vaihinger's once popular philosophy of 'as if' (see Vaihinger, H.). According to Vaihinger (1911), thinking by means of fictions is a fundamental cognitive process, as basic and pervasive as deductive or inductive thought themselves. Vaihinger makes a primary distinction between 'scientific' and the 'unscientific' fictions: that is, between those that actually prove useful (scientific) and those that do not. He cites atoms as an example of a scientific fiction, believing that they rest on the concept of point masses and the vacuum, neither of which he regards as real. Newton's laws would be another scientific fiction (see Mechanics, classical). By contrast the infamous 'dormitive virtue' proposed by the doctors in Molière's *Le Misanthrope* would be an example of an unscientific fiction. Vaihinger goes on to classify many different types of fiction and to document their occurrence in virtually every scientific discipline. The fundamental distinction for Vaihinger's account, as for any version of fictionalism, is that between a fictional proposition and a scientific hypothesis. For Vaihinger, scientific hypotheses are verifiable by observation and are chosen over rivals according to the probability that they are true. Fictions on the other hand are justifiable only in terms of their utility (not truth or probability) and are chosen over rivals as being the most expedient means to the ends we have in mind.

Vaihinger's work, and fictionalism in general, enters the debate over scientific realism by challenging the inference from something's being useful to its being real, from utility to reality. A fiction is precisely a useful construct that is not real. In terms of recent debates (see Scientific realism and antirealism) fictionalism challenges the explanationist argument for scientific realism, which holds that only the truth of a scientific theory and the actual existence of the entities occurring in the theory could account for the theory's instrumental success. Fictionalism's challenge to realism is to point out that we can account for success quite well by supposing nothing more than this, that at the observable level it is just *as if* the scientific theory were actually true. This may not seem satisfactory to the realist who will accept no explanation short of the literal truth of science and will therefore press the question as to why our theories possess this dispositional property of instrumental reliability (the 'as if'). Pragmatists, however, point out that requests for explanation have to stop somewhere and that stopping here, with the fundamental reliability of our theories, is the right place (indeed the only place) if we want to align our beliefs with our epistemological practice, since that practice all along is pitched to reliability. Whatever the final verdict, it does seem that we can respond to the realist and explain scientific success by treating successful scientific stories as, roughly speaking, scientific fictions.

Idealizations and approximations play an essential role in science (see Idealizations). These are paradigm examples of scientific fictions. Moreover if we think of models as maps, useful tools for navigating our way around but always and necessarily false to reality, then the idea of a scientific fiction encompasses models as well. In the present era of computer simulations and virtual reality, a dominant picture is the image of science as the builder of

useful models. Thus one productive way to appreciate fictionalism is to see it as concerned with how models are articulated and work in scientific thought. In that light it may have more to offer than just another twist in the realism debate. Rather we might think of fictionalism as the beginning of a more comprehensive philosophical treatment of modelling (see Models).

Field theory, classical

A physical quantity (such as mass, temperature or electrical strength) appears as a field *if it is distributed continuously and variably throughout a region. In distinction to a 'lumped' quantity, whose condition at any time can be specified by a finite list of numbers, a complete description of a field requires infinitely many bits of data (it is said to 'possess infinite degrees of freedom'). A field is* classical *if it fits consistently within the general framework of classical mechanics. By the start of the twentieth century, orthodox mechanics had evolved to a state of ontological* dualism, *incorporating a worldview where massive matter appears as 'lumped' points which communicate electrical and magnetic influences to one another through a continuous intervening medium called the electromagnetic field. The problem of consistently describing how matter and fields function together has yet to be fully resolved.*

Initially, most of the fields considered in mechanics were *material*: they possess mass and can be acted upon by forces. Simple examples are flexible strings, membranes, fluids (which include gases) and elastic spheres (as long as these objects are treated as continuously distributed and not merely as swarms of point masses). Derivative kinds of field can depend upon these material underpinnings - for example, the distribution of a temperature field. The laws for such material 'continua' can be rather tricky to formulate (see Mechanics, classical).

By the end of the nineteenth century, massless fields independent of particulate matter began to be considered in classical mechanics. When J.C. Maxwell originally proposed his equations for electromagnetism, he believed that this field was composed of an 'ether' that was similar in many respects to a common elastic solid (see Maxwell, J.C. §2). After the Michelson-Morley experiment of 1887, this material interpretation was abandoned and the electromagnetic field became regarded as a physical entity *sui generis*. It was now a substance without mass that could store and transmit energy as ably as matter.

In this respect, electromagnetism differs from what is loosely dubbed 'the classical gravitational field'. On the Newtonian account, if a massive particle is wiggled, any distant particle will instantly feel a gravitational tug due to an 'action-at-a-distance' force acting directly between the matter (see Newton, I. §§3-4). No intervening medium is needed to transmit the force between the particles or to store the tug's energy while in passage. If the gravitational attraction of a massive body is approximated as an 'external force', a so-called 'field of the gravitational potential' can be introduced which, mathematically, proves a great convenience, but this 'field' does not qualify as an independent entity because it transmits all effects instantaneously and its state is always entirely conditioned by the state of the originating particles. In electromagnetism, by contrast, one could know the 'initial condition' of all matter in the universe, yet be unable to determine how the universe will behave. The condition of the field apart from the matter must also be specified, for significant amounts of energy might be traversing the field in the form of electromagnetic waves.

A basic problem tends to plague all forms of particle-field duality. If the two entities subsist independently, the field created by a bit of matter ought to affect that bit of the matter itself according to the same laws as govern the coupling between the field and any other body. The reaction of matter to a field that it itself initiates is called the back action of the field. If the matter is concentrated within an isolated point, as often happens in classical theories, it will usually create too strong a field within its own locality, leading to infinite amounts of back action against itself.

A variety of strategies have been proposed to rectify this problem: regard the 'field' as merely a mathematical convenience - retain a 'monism' of particles only. A careful look at how gravitational 'fields' are introduced into 'point mass' mechanics reveals that no overall gravitational field is ever defined by standard arguments, but merely a set of so-called 'other fields' that codify the forces exerted upon a given mass by the other bodies in the universe. 'Other fields', by their very definition, exert no back action and they should not be regarded as truly independent of the matter. Another strategy would be to smear out the mass, charge, and so on, of the particle over a finite volume, so that the total back action of its component points never becomes infinite. 'Other fields' are thus avoided, although this kind of field will still transmit all effects instantaneously and cannot sustain gravitational waves. In the 1890s, H.A. Lorentz tried to resolve the difficulties of electromagnetic dualism in a 'smeared out' manner also. A mechanism for creating a resistant stress becomes necessary to prevent the finite back action from

quickly collapsing or inflating the particle. Suitable candidates for this ’stress’ are hard to find. A third strategy could be to remove the dualism by converting the ’particle’ into a singularity within the field - this supplies a ’monism’ of fields. Examples of the approach are (William Thomson) Lord Kelvin’s proposal that ordinary atoms represent the centres of vortices twisting in the ether and William Clifford’s suggestion that particles are geometrical singularities within a non-Euclidean space.

In electromagnetism, none of these alternatives works very well. Because of field energy storage, one cannot easily retreat to the simple ’monism’ permitted in the case of gravitation. An interesting effort at electromagnetic particle monism was proposed by Feynmann and Wheeler, based upon the work of Gustav Mie. Philosophers sometimes claim that this theory, despite its distinct ontology, is ’observationally equivalent’ to standard electromagnetism. In the author’s opinion, such claims do not survive scrutiny. In any case, since a measurable electromagnetic back action is experimentally detectable, the simple ’Lorentz law’ treatment of field-particle coupling described in most textbooks is too simple to be correct. The more refined classical treatment articulated by P.A.M. Dirac in the 1930s turns out to have very bizarre consequences with respect to causality and the like.

Related problems of back action continue to trouble quantum versions of field theory as well.

Field theory, quantum

Quantum field theory extends the basic ideas of quantum mechanics for a fixed, finite number of particles to systems comprising fields and an unlimited, indefinite number of particles, providing a coherent blend of field-like and particle-like concepts. One can start from either field- or particle-like concepts, apply the methods of quantum mechanics, and arrive at the same theory. The result inherits all the puzzles of conventional quantum mechanics, such as measurement, superposition and quantum correlations; and it adds a new roster of conceptual difficulties. To mention three: the vacuum seems not really to be empty; the particle concept clashes with classical intuitions; and a method called 'renormalization' gets the best predictions in physics, apparently by dropping infinite terms.

1 Approaches to quantum field theory

There are three conceptually distinct ways of introducing quantum field theory. We grasp the theory best by taking note of all three.

Classical objects have degrees of freedom, independent ways they can move - a locomotive confined to its tracks has one degree of freedom, a baseball has three (ignoring spin). We start with the classical picture of a system of discrete particles, each with three degrees of freedom, each degree of freedom in turn described with a pair of (conjugate) variables, typically position and momentum (see Mechanics, classical). Conventional quantum mechanics 'quantizes' such a system by replacing each pair of variables with a pair of operators (satisfying a commutation relation) that transform vectors in a vector space. These vectors describe the quantum states, and a simple formalism involving the operators and a state gives the values for quantities in the state. Unlike a classical system, the states do not in general give exact values for quantities, but only probabilities for what values will be found if a measurement is made. At most, one of a pair of quantities, such as position and momentum, can take on an exact value in a given state (see Quantum mechanics, interpretation of).

The first approach to quantum field theory applies this procedure to a classical field conceived of as a system with an infinite number of degrees of freedom (see Field theory, classical). In classical field theory one associates a field value, such as a value of the electric field, with each point in space. Think of such a field value as a 'position' in an abstract space. A standard (Lagrangian) formalism associates a second 'momentum' variable with each of these 'position' variables. So the field has been described as a system with infinitely many degrees of freedom, one at each spatial point, and each described with a 'position' and a 'momentum' variable. To quantize, one replaces each pair of variables with a pair of operators, all acting on a giant vector space. As before, vectors represent states, in general giving only probabilities on measurement for observed field values. The classical field equation, describing the relation between classical field values at neighbouring places and times, generalizes to an operator equation constraining the probabilities for field values at neighbouring points.

So far we see the theory's connection with fields but not with particles: a second approach allows us to see the latter connection. Quantum descriptions of 'particles' depart from classical descriptions in never assigning exact spacetime trajectories and in recognizing no 'individuality' distinct from qualitative properties. To mark the differences we will talk about *quanta* instead of particles. To reveal the theory's commitment to quanta, start with a classically described field, but redescribe it as a sum of simple waves - called 'harmonic modes' - of various frequencies. Each mode has the form of a harmonic oscillator - something behaving like a pendulum or oscillating spring - so that the field has been redescribed formally as a collection of independent harmonic oscillators. Now apply the quantization procedure to each of the (formal) harmonic oscillators.

A quantized harmonic oscillator has evenly spaced, exact energy states, beginning with a lowest, inviting us to interpret them as a state with zero quanta, a state with one quantum, a state with two quanta, and so on, each quantum with the same momentum. Different momenta go with different oscillators so that any 'excitation' state of the collection of oscillators can be reinterpreted as a collection of various number of quanta with various momenta. So far the account describes only Bosons, quanta of which there can be any whole number in a given state; but with an adjustment in the operators used in quantizing the oscillators (changing commutators to anticommutators) one gets a description of Fermions, quanta of which there can be only zero or one quantum in a given state.

In this formulation the collection of possible quantum states, called 'Fock space', is described in terms of basis

states, written ‘ $| n_1, n_2, n_3, \ldots n_k\rangle$’, in which, for each n_i, there are n_i quanta described by some maximal list of properties, and each n_i a non-negative integer for Bosons, or zero or one for Fermions. Fock space includes weighted sums (superpositions) of these basis vectors, introducing an element not found in conventional quantum mechanics, states with an indefinite number of quanta and temporal change from states with one number of quanta into states with another number. Manipulation of the formalism is facilitated by special (non-Hermitian) *raising* and *lowering* operators which transform a Fock space state into one describing, respectively, one more or one less quantum. Often these are called ‘creation’ and ’annihilation’ operators, but since arguably they do not describe processes of creation and annihilation the alternative ‘raising’ and ‘lowering’ operator terminology is recommmended.

Approaching the theory via quantized harmonic oscillators yields a formulation which seems to talk about quanta. But a simple redescription (a transformation very like the conventional Fourier transform from the momentum to the position basis) restores a field-theoretic appearance. After redescription one has raising and lowering operators, $\Psi^\dagger(x)$ and $\Psi(x)$, indexed by a spatial variable. (To facilitate relativistic description practitioners generally use a spacetime variable.) Often one informally describes $\Psi^\dagger(x)$ and $\Psi(x)$ as ‘creating and annihilating quanta at *x*’. But the raising and lowering operators do not describe creation and annihilation events, and the quanta associated with such operators are concentrated around a point, *x*, but not strictly localized at it.

Given the operators indexed by spatial (or spacetime) variables, people often talk of an ‘operator valued field’, as if the theory specified values of a physical quantity to spatial points by providing operators indexed with a spatial variable. This is misleading: an operator does not correspond to a value of a quantity, but to the whole spectrum of values which the quantity can assume. One sees the field-theoretical aspect more accurately in the assignment of probabilities of values to spatial points or, better yet, in the connection with classical field theory through the first form of field quantization.

The two methods described above are called *field quantization*. An extension of the technique starts with a spacetime description of the state from conventional or *first quantized* quantum mechanics and applies the quantization procedure to this state function, or *second quantizes* it, treating it as if it were itself a classical field. Field quantization of the classical electromagnetic field results in a theory of photons. Second quantization of a first quantized theory of particles produces a theory of quanta such as electrons and protons.

A third approach to quantum field theory starts with the quanta themselves. One assumes a state to be completely described by specifying the number of quanta described by each possible maximal list of properties: one cannot get a new state description by switching around ‘which’ quanta have which properties. But these are just the basis states of the Fock space from the last approach. Taking the full Fock space to include the weighted sums (superpositions) of these basis states gives a theory including indefinite and variable number of quanta; and by generalizing on the assumption that the quanta individually obey conventional quantum mechanics, one gets the same theories generated by field quantization and its second quantization analogue.

2 Puzzles in quantum field theory

In the *vacuum*, the state with no quanta, one would expect all quantities to have a null value. But many have a positive expected average on measurement (expectation value). A second problem concerns any detector designed to register ‘no quanta’ when it is non-accelerating in the vacuum state. If one accelerates this detector through the vacuum it will react as if it were moving through a thermal bath of so-called *Rindler quanta*! So is the vacuum a state with no quanta or is it not?

Both these problems turn out to have the same formal basis as the fact from conventional quantum mechanics that a state which has an exact value for either position or momentum will have no exact value for the other quantity. The vacuum is exact for the quantity, *number of quanta*, and inexact for (complementary) field quantities. Consequently the vacuum definitely has zero quanta and has no actual values for field quantities, though this state has positive *probability* for finding non-null values for field quantities on measurement. Then field quantities such as energy, which have only positive values, can still have a positive average (expectation value) for the results of measurement. Formally analogous considerations apply to Rindler quanta. Interpreters disagree as to whether these considerations resolve the puzzle. There are further puzzles about the free vacuum in a relativistic theory, involving distant correlations which suggest that any quantal concept must, strictly speaking, be a global concept,

not a local one.

The presentation to this point has described only free quantum field theory, a theory of non-interacting quanta. But different kinds of quanta interact with one another: free quantum field theory is a severe idealization since, as physicists say, ‘we cannot turn off the interaction’. One transforms the free theory into interacting quantum field theory by adding the effects of interaction into the equations of motion, resulting in a theory vastly more complex and laden with difficulties. Calculation requires approximation methods which, if not to be interpreted instrumentalistically, introduce new interpretive problems.

A common method of approximation (perturbation expansion) results in divergent integrals arising from quanta interacting with themselves. An ingenious scheme, known as *renormalization*, allows the offending terms to be grouped systematically with terms describing the quanta’s mass and strength of interaction. By substituting the observed values of the mass and ‘coupling constants’ for these ‘renormalized’ terms the approximation method produces startlingly good predictions. This procedure has shocked many who gloss it as ‘discarding infinities’.

Physics texts make clear that renormalization involves no mathematical sleight of hand. The theory must break down at very high momenta, if only because not all interactions have been taken into account. In effect one substitutes observed values for masses and coupling constants where the theory breaks down, ensuring mathematical honesty by making the substitutions before taking the limits on the offending integrals. It is a little like using an observed value for Hooke’s spring constant where one could not calculate the constant from first principles. (While most endorse the foregoing, two of the subject’s giants, Dirac and Feynman, thought renormalization could not be so easily resolved.)

Many likewise accept resolution of puzzles surrounding *virtual quanta*. The terms of an approximation expansion can be presented by a graphic technique called *Feynman diagrams*. These diagrams depict a network of creation and annihilation of ‘virtual’ quanta thought of as ‘mediating’ the interactions, tempting people to think that the virtual quanta actually exist. But they exist only as elements of a gigantic sum (superposition), so that they exist as do component simple waves whose sum is a complicated actually occurring wave pattern.

Quantum field theory as used by working physicists is not a formally exact theory. There is a version, axiomatic quantum field theory, which achieves rigour at the expense of most practical application. Within axiomatic quantum field theory one can prove (Haag’s theorem) that in the interacting theory observed states of quanta are not related by intermediate states in the way usually assumed by the working theory, again suggesting that the theory recognizes only a global concept of quanta. Most working physicists simply dismiss these and related problems: after all (precise) axiomatic quantum field theory and (imprecise) working quantum field theory are not the same theory. But some maintain that Haag’s theorem signals important formal and interpretive problems.

Description of electrons involves an arbitrary element (the absolute phase) superficially similar to an arbitrary choice of unit of length. Setting this element arbitrarily at each point in space seems to force the assumption of a ‘compensating’ field, interpretable as the photon field, which describes electromagnetic forces. Generalization of this idea of *gauge theories* extends quantum field theory: internal degrees of freedom of quanta involve similar ‘arbitrary’ elements again appearing to require assumption of further quantized fields, interpretable as the agents of the weak and strong forces. The resulting theory, known as the *standard model*, provides our most detailed picture of the internal structure of matter with the electro-weak theory and quantum chromodynamics. But the quarks of chromodynamics apparently cannot exist in a free state. Is that a problem? The fact that deep inelastic scattering experiments are interpretable as extremely indirect detection of quarks probably means that such quark confinement should not worry us. But at the time of writing the nature of the argument for the existence of gauge fields stands to be better understood.

Film, aesthetics of

Film aesthetics has been dominated by issues of realism. Three kinds of realism attributable to film may be distinguished: (1) the realism inherent in film because of its use of the photographic method (realism of method); (2) realism as a style which approximates the normal conditions of perception (realism of style); (3) realism as the capacity of film to engender in the viewer an illusion of the reality and presentness of fictional characters and events (realism of effect). Some theorists have argued that realism of method requires us to avoid realist style, others that it requires us to adopt realist style. Most have agreed that realist style makes for realism of effect; they disagree about whether this is a desirable goal. It is argued here that these realisms are independent of one another, that realism of style does not entail any kind of metaphysical realism, and that realism of effect is irrelevant to understanding the normal experience of cinema. Realism of style suggests a way of making precise the claim that cinema is an art of time and of space, because this kind of realism is partially explicated in terms of the representation of time by time and of space by space. Psychological theorizing about the cinema has been strongly connected with realism of effect, and with the idea that an illusion of the film's reality is created by the identification of the viewer's position with that of the camera. Another version of illusionism has it that the experience of film-watching is significantly similar to that of dreaming. Such doctrines are undermined when we acknowledge that realism of effect is an insignificant phenomenon.

1 History

The first period of serious writing on film aesthetics (roughly from the 1920s to the 1950s) was devoted to the problems raised by the photographic method, and to the accusation that film was merely the automatic recording of reality. The second period, still under way, has been dominated by attempts to elaborate a theory about the role of the camera as spectator, participant and the object or vehicle of the viewer's identification. But issues of realism have continued to be influential.

Two opposing tendencies were evident in the first period. One sought to show that what was distinctive about cinema, and therefore to be encouraged, was the means, notably editing, by which the product deviated from a mere recording of the real world (realism of method). This view was often combined with an opposition to the use of integrated sound, on the grounds that its use resulted in a hybridized and weakened medium. In film practice this tendency was evident in the montage style of the early Soviet cinema, which emphasized the juxtaposition of objects and events by quick cuts, close-ups and striking camera angles. Thus realism of method was made the grounds for preferring an unrealistic style. The contrary and somewhat later tendency was to celebrate the dependence of film on the process of automatic recording, to argue that the medium of film is reality itself, and that in consequence developments like sound and colour are to be seen as fulfilling the historical destiny of cinema because they are additions to the realism of film. Central to this view was an endorsement of so-called 'long-take, deep-focus' style, thought to provide a visual experience approximating to our visual experience of the real world, and enabling different actions to take place within the same frame - a capacity later enhanced by the introduction of wide screen. Thus realism of style was justified by an appeal to realism of method.

Both tendencies exhibit a high degree of concern for prescriptive issues about film-making. The writing that initiated the second period during the 1960s rejected this approach and sought a new, ostensibly more scientific attitude to cinema through the articulation of a supposed language of film, which would enable us to analyse film technique and the viewer's strategies for understanding film. But this approach soon abandoned its structuralist and quasi-scientific impetus in favour of a psychologically oriented approach that sought to analyse the way that film, especially the mimetic cinema of Hollywood, engages the viewer, and to characterize the experience of engagement as a species of entrapment. Thus the second period has generally been hostile to the realist tendency of the first period. Film theory in this second period has had a distinctly political agenda, drawing on Marxism and psychoanalysis to explore the role of film in reinforcing the viewer's subjective identity. Feminist theorists have argued that conventional film-making is geared to the satisfaction of male voyeuristic desire (Mulvay 1976).

2 Realism of method and of style

The idea behind realism of method seems to be that the photographic medium enables us to see things themselves rather than representations of them; in this respect photographs are said to be akin to lenses and mirrors, in contrast

to paintings (and, presumably, animated cartoons) which give us mere representations of things see Photography, aesthetics of). Even assuming that realism of method is correct, no theorist has adequately explained how this purely descriptive claim entails the evaluative claim that long-take style is preferable to montage style. And those who sought to justify realist style in terms of realism of method overlooked a crucial distinction between what the camera literally records - actors, props and sets - and the fictional objects and events it presents. Realism of method applies only to the first of these, whereas realism of style is primarily a vehicle for the presentation of the second. Further, if realism of method unequivocally favours realist style, we must endorse what are generally agreed to be rather problematic developments: 3D, smellorama, and the ultra-long-take method of Hitchcock's *Rope*.

Some writers have denied that long-take, deep-focus style is realistic. In fact, a defence of the realism of that style is possible. Let us say that a mode of representation is realistic when, or to the degree that, we employ the same capacities in recognizing its representational content that we employ in recognizing the (kind of) objects its represents. A good-quality, well focused, middle-distance photograph of a horse is realistic in this sense: we employ our capacity to recognize horses visually so as to determine that this is, indeed, a photograph of a horse. Many paintings would count as realistic by the same criterion. A linguistic description of a horse, by contrast, is not realistic, for the capacity to recognize horses visually is not sufficient to enable you to recognize this as a representation of a horse; that requires a knowledge of the conventions of language. (There may be other senses in which the description is realistic.) Realism of style is a matter of degree; some aspects of the content of a representation may be recognized by deploying the capacity for object-recognition, while others are not.

By this criterion, long-take, deep-focus style is (relatively) realistic. Watching a film in this style, we judge the spatial and temporal relations between the objects (and their parts) and the events that the image represents by using the capacity visually to judge spatial and temporal relations between real things. We judge the spatial relations between objects visible in the same frame by seeing that they are spatially related thus and so within the visual field; we judge the temporal properties of and relations between events within the take by noting that this event took (roughly) so long to observe, while this one was experienced as occurring later than or earlier than that one. That is just how we perceive the spatial and temporal properties of things and events in the real world. With montage style, by contrast, where there is quick cutting between very distinct spatial (and sometimes temporal) perspectives, these properties and relations have to be judged, with greater frequency, by means of inference from the overall dramatic structure of the film.

It has been said that deep-focus style is unrealistic in that it presents us with an image in which objects at considerably different distances from the camera are simultaneously in sharp focus, whereas objects at comparable distances from the eye could not be seen in focus together (Ogle 1972). This does not seriously detract from the realism of deep focus. Deep focus, particularly when used in conjunction with wide screen, enables us to concentrate our attention on one object, and then to shift our attention at will to another object, just as we are able to do when perceiving the real world. Since we are usually not very conscious of refocusing our eyes, the similarities between viewing deep-focus style and perceiving the real world are more striking than the differences. With montage style, on the other hand, we are severely limited, by shot length and depth of field, in our capacity to shift our attention from one object to another at will - though this feature is not entirely absent in montage style.

Explicating the idea of realism of style in this way helps us to avoid an error that has dogged theorizing about the cinema: that realism in film can be attacked on metaphysical grounds because it postulates a real, observer-independent world, an idea that some theorists then further associate with a politically conservative agenda of submission to prevailing conditions. But realism of style as I have explicated it here appeals to no such postulate of an observer-independent world (though one might argue that such a postulate is both philosophically respectable and politically neutral). The claim of stylistic realism is not the claim that cinema presents objects and events isomorphic to those that exist in an observer-independent world. It is the claim that, in crucial respects, the experience of film-watching is similar to our ordinary perceptual experience of the world, irrespective of whether and to what extent that world is independent of our experience of it.

3 Space, time and film

We can now see an important sense in which film is both a spatial and a temporal medium. Film represents space

by means of space, and time by means of time. It is the spatial (temporal) properties of the cinematic representation that we observe and rely upon in order to figure out what spatial (temporal) properties of the fictional characters and events are portrayed. It is correctly said that painting and still photography are capable of representing the temporal: by inference, by juxtaposition of distinct static images, by transforming temporal properties into spatial ones (where, say, being further to the right represents being later in time), and by special techniques such as blurring and multiple exposure. But these possibilities do not constitute grounds for calling painting and still photography arts of time in the way that cinema is, for they do not represent time by means of time.

So far we have considered untensed temporal properties of duration and precedence. What about the representation of tensed temporal properties: pastness, presentness and futurity? Theorists have often argued that film represents fictional events as occurring now, in the sense that viewers are to think of those events going on in the present as they watch. This is one consequence of the doctrine of realism of effect, according to which film typically creates an illusion in viewers' minds that the fictional events represented on screen are real, and that they, the viewers, are present (spatially and temporally) at their occurrence. Realism of effect will be discussed in the next section; here we concentrate on the claim of temporal presentness. One problem with the view that film represents fictional events as occurring in the viewer's present is that it then becomes difficult to make sense of the idea of 'anachrony' in film - the flashback or flashforward. If viewers are to think of the image they see as representing something occurring now, an anachronous sequence would require them to imagine travelling in time, viewing what is objectively past or future in their subjective present. But this is neither plausible psychologically, since viewers of anachronous material do not seem to imagine themselves travellers in time, nor helpful in maintaining the integrity of the action, since time travel introduces an element of fantasy that would be unwelcome in our experience of many naturalistic films that none the less display anachrony in their narratives.

If, on the other hand, we say that film does not represent fictional events as present to the viewer, but merely as standing in untensed relations of precedence and simultaneity to one another, how shall we explain anachrony? After all, anachronous representations seem to be ones that represent the past (as in flashback) and the future (as in flashforward). In fact, we can explain anachrony in untensed terms as follows: we have anachrony when an event occurring earlier in fictional time than another occurs later in the time of narrative exposition; here we appeal only to untensed notions of precedence. Such a tenseless approach implies a certain relativity and even arbitrariness in the application of the notions of flashback and flashforward; a film's narrative structure, or part of it, could sometimes equally well be described as employing the one as the other. If, on the other hand, we could appeal to tense and identify non-anachronous material as temporally present, we would have an absolute distinction between flashback (past) and flashforward (future). But this relativity in the tenseless account of anachrony is arguably no drawback. The fact that one of the two labels (flashforward, flashback) often seems more natural than the other may be accounted for by appeal to the fact that one of them allows a simpler, and therefore preferable, description of the film's temporal structure. It may also be that one or other description accords better with the dramatic structure of the film at that point, which may involve an episode of memory (in which case the description in terms of flashback will seem preferable) or premonition (which favours flashforward). There will, on this view, be occasions when there is nothing to choose between the two descriptions; and indeed there are films (*Last Year at Marienbad*, for example) of which it seems right to say that there is no uniquely correct description of their temporal structure. In that case, while anachrony itself is a notion definable in temporal but tenseless terms, the direction of anachrony needs to be defined in pragmatic and dramatic terms.

4 The camera, the eye and realism of effect

Many theorists have argued that the mechanism or 'apparatus' of cinema encourages and perhaps requires the viewer to think of cinematic images as corresponding to the perceptual states of an observer whose eye is the lens of the camera itself (Aumont 1989: 2). This idea is reinforced by the doctrine of realism of effect, in the following way. If viewers are victims of an illusion created by the film, then presumably they must think that the reality supposedly seen is seen from their point of view, by means of their visual organs. Since film manifestly works by presenting events from another, independent position - that of the camera - illusion-dominated viewers must come to think of themselves as occupying that position.

There are two objections to the idea that film induces the illusion that fictional events are real and that the viewer

is directly witnessing them. The first is that there is little evidence that film typically creates, even temporarily or in part, the false beliefs necessary to sustain such an illusion; film watchers do not behave like people who believe, or even suspect, that they are in the presence of axe murderers, world-destroying monsters or nuclear explosions. Second, this theory is at odds with much of the experience of film-watching; identification with the camera would frequently require us to imagine ourselves in peculiar or impossible locations, undertaking movements out of keeping with the natural limitations of our bodies, and peculiarly invisible to the characters. None of this seems to be part of the ordinary experience of film-watching. In the attempt to identify the camera with some observer within the world of the action with whom the viewer can in turn identify, theorists have exaggerated the extent to which shots within a film can be thought of as point-of-view shots, and have sometimes postulated, quite ad hoc, an invisible narrator from whose position the action is displayed. It would be better to acknowledge that cinematic shots are only rarely from a psychological point of view, and abandon the thesis that the viewer identifies with an intelligence whose point of view is the camera.

A variant of illusionism says that the situation of the film watcher approximates to that of a dreamer, in that both situations present us with a strong impression of the reality of that which is actually unreal (Metz 1970). In that case the camera would correspond to a supposed ‘inner eye’ by means of which we perceive the images of dreams. This analogy has been a powerful stimulus to the development of psychoanalytic theories of film and film experience. In fact the analogy with dreaming fails to compare like with like. Dreamers, like film watchers, are usually physically passive while watching or dreaming. But the experience of dreaming is usually one that involves action - sometimes ineffectual - on the dreamer’s part, while the experience of film-watching, our reflex responses aside, rarely involves physical action. And it is the experience of film-watching and the experience of dreaming that are claimed by the advocates of the dream/film analogy to be alike. In dreams, our own actions and sufferings are of central concern to us; the experience of film-watching makes us largely forgetful of ourselves while we concentrate on the fate of the characters.

Filmer, Sir Robert (1588-1653)

Filmer was one of the most important political thinkers in seventeenth-century England, and the author of Patriarcha. Locke replied to this and other works by Filmer in the Two Treatises of Government - perhaps the most famous of all works of liberal political theory. Filmer argued that notions of mixed or limited government were false and pernicious, and that the powers of all legitimate rulers were derived not from the people but directly from God, to whom alone rulers were accountable. Filmer's contemporaries commonly held that the authority of a father and husband over his family stemmed not from the consent of his wife and children but from the natural and divinely appointed order of things. Filmer harnessed such ideas to the cause of royal absolutism by arguing that the state and the family were essentially the same institution.

1 Life and works

Filmer was born in 1588 into a large and wealthy Kentish family. He was an eldest son, and upheld political beliefs which took it for granted that primogeniture in the male line was the proper means of succession in families and states. After attending Trinity College, Cambridge, and Lincoln's Inn, in 1613 he was called to the bar. He married a bishop's daughter and the couple settled in lodgings at Westminster Abbey. In 1619 Robert was knighted. A decade later he inherited his father's estate in Kent.

Sir Robert had connections with the royal court (where a brother held office) and with the upper ranks of the church (through his wife and through his friend Peter Heylin, the chaplain and biographer of William Laud, Archbishop of Canterbury). The ideological stance which Filmer adopted in his writings was strongly influenced by attitudes common among courtiers and high-ranking clerics. It is unclear when he began to write, but not long before 8 February 1632 he brought to the relevant royal official 'a Discourse to bee licensed for printing, written of Government and in praise of Royaltie and the supreme authority thereof'. The official asked the king himself whether it would be expedient to publish the book, and on 8 February Charles I examined the work and decided to forbid publication. The book was almost certainly *Patriarcha. The Naturall Power of Kinges Defended Against the Unnatural Liberty of the People*: the text of one manuscript of *Patriarcha* is dateable on internal evidence to between 1628 and 1631, and it is plausible that parts of the work are from much earlier still. Charles refused to license Filmer's treatise for the press, probably because he feared that it would foment unnecessary strife as its political doctrines were so uncompromising and so trenchantly expressed. Filmer later revised the book and drew on it in his published pamphlets, but *Patriarcha* itself was printed only in 1680.

In the Civil War between Charles and parliament (1642-6), Filmer's eldest son left Kent and sided actively with the king, but the ageing Sir Robert stayed at home. Kent quickly fell into the hands of parliament, and for a while Filmer was imprisoned. In 1648 the leading royalist publisher Richard Royston brought out two pamphlets by Filmer, *The Free-holders Grand Inquest Touching Our Soveraigne Lord the King and His Parliament* and *The Anarchy of a Limited or Mixed Monarchy* (Filmer's authorship of *The Free-holders* has been challenged but is generally accepted). Royston also published another work, *The Necessity of the Absolute Power of All Kings: and in particular, of the King of England*, compiled by Filmer from the writings of Bodin (§§2-3). Internal evidence suggests that the two former texts were written around 1644. Until Charles I's final defeat in 1646, most royalist pamphlets attempted to win support for the king by stressing the moderation of his cause, but Filmer's writings were outspokenly absolutist; this may explain why they (like other trenchantly absolutist writings such as Hobbes' *Elements of Law*) were not published until later (see Absolutism). Two final political writings by Filmer appeared in 1652, the year before his death. One, *Observations Concerning the Originall of Government*, criticized the ideas of Hobbes (§§6-8), Milton and Grotius. The other, *Observations upon Aristotles Politiques, Touching Forms of Government*, included an appendix, 'Directions for Obedience to Governours in Dangerous and Doubtfull Times', in which Filmer argued that limited obedience to the usurping government of the Rump parliament was justifiable, but that no usurpation - however lengthy - could extinguish the right of the true rulers (contradicting his earlier views on usurpation). Some other brief political writings have been attributed to Filmer, but on insufficient grounds. Filmer did, however, write short published works on witchcraft and usury, and a manuscript essay 'In Praise of the Vertuous Wife'.

2 Political theory

Filmer's political writings were intended to refute ideas of legitimate resistance and limited or mixed monarchy which circulated among critics of royal policy in the early seventeenth century (these included the Catholics Suarez (§4) and Bellarmine, and a number of parliamentarian pamphleteers). The cardinal error of most political theorists, Filmer argued, was their supposition that people were born free and equal. From this false premise they drew the erroneous conclusions that states had originally arisen by the consent of their members, that political power had at first grown out of the community as a whole (for if all were equal, no one had any more right to exercise such power than anyone else), and that the powers of rulers were therefore derived from the community, which could discipline and perhaps even depose them if they failed to abide by the conditions upon which authority had been transferred to them.

Filmer claimed that this whole line of reasoning was faulty since people were in fact born into subjection to their fathers. He argued that Adam (the first father of all) had held authority over his children and their descendants, and over all property in the world. Adam's authority arose from his position as the ultimate ancestor of the group. Filmer claimed that Adam's power was fully political, and that it included the right to execute his subjects. By nature, he held, children remained subject to their fathers throughout their lives, although a father could decide to free them from subjection. If a son were freed in this way, he would then be able to wield full fatherly/political power over his own descendants. The ordinary means of succession to a father's power and property was by primogeniture in the male line, but a ruler could alter this arrangement (Noah, for example, divided the earth among his sons). Sovereigns could also hand over authority to someone else, and God might providentially intervene in human affairs by changing the ruling family or even the form of government (although monarchy was the best form). Filmer did not argue that the whole world should be ruled by Adam's heir (whoever that might be), for he recognized that Adam's original empire had been split into a large number of states. His central contention was that the rulers in all of these states exercised the same powers that Adam had - powers which were sovereign and independent of the consent of the people.

Filmer frequently quoted scripture (particularly the book of Genesis), the Civil Law, Aristotle and Bodin. His patriarchal theory of the origins and nature of government is, however, not easy to find in these sources. Bodin did indeed assert that by nature fathers have the power of life and death over their wives and children, but the Adamite elements of Filmerian patriarchalism are not present in his writings. They are present in the works of some English authors, notably Hadrian Saravia, who put forward views which are virtually indistinguishable from Filmer's in the 1593 Latin text, *De imperandi authoritate*. Like Filmer, Saravia argued that the family and the state were not merely analogous but identical institutions. Filmer, throughout his political writings, stressed that sovereignty in every state must be unlimited (except by the laws of God and nature) and indivisible, ideas which he took unaltered from Bodin (see Sovereignty §1).

Arguably Filmer was at his most effective and most original in his criticisms of theories of original popular sovereignty and the contractual origins of political power. He argued that contract theory was unconvincing on both historical and philosophical grounds and claimed that contract theorists themselves inconsistently adopted patriarchalist principles - for example, to argue that women and children were bound by political arrangements to which they had not consented (see Contractarianism).

3 Posthumous debate on his ideas

In 1680 *Patriarcha* was published as a contribution to the debate over the nature and extent of royal power which accompanied the Exclusion Crisis. Filmer's other political works had been reissued in the previous year. His writings soon attracted responses from James Tyrrell, Algernon Sidney and John Locke. For many years it was almost universally accepted that Locke had refuted Filmer's theory, successfully exposing his opponent's absurdities (Locke 1690). More recently, some feminist scholars have argued that this verdict is only partially justified and that Locke (and other liberal theorists) did not adequately meet Filmer's criticisms of contract theory, since they tacitly and inconsistently accepted patriarchalist assumptions.

JOHANN P. SOMMERVILLE

List of works

Filmer, Sir R. (1648a) *The Free-holders Grand Inquest Touching Our Soveraigne Lord the King and His Parliament*, London: Royston.(A long historical account of English constitutional development, arguing that

parliament is subordinate to the king.)
— (1648b) *The Anarchy of a Limited or Mixed Monarchy*, London: Royston.(Attacks the claim of the parliamentarian pamphleteer, Philip Hunton, and others that England is a mixed and limited monarchy by asserting that such a monarchy is impossible.)
— (1648c) *The Necessity of the Absolute Power of All Kings: and in particular, of the King of England*, London: Royston; compiled from J. Bodin, *The Six Bookes of a Commonweale*, trans. R Knolles, London: Bishop, 1606. (A collection of extracts from Bodin on absolute power and sovereignty.)
— (1652a) *Observations Concerning the Originall of Government*, London: Royston.(Attacks Hobbes, Grotius and Milton. Agrees with Hobbes on the nature of sovereign power, but denies that it is rooted in popular consent.)
— (1652b) *Observations upon Aristotles Politiques, Touching Forms of Government*, London: Royston.(Argues that Aristotle's *Politics* supports absolute monarchy.)
— (*c*.1628-31) *Patriarcha. The Naturall Power of Kinges Defended Against the Unnatural Liberty of the People*, London: Davis, 1680.(Presents the fullest version of Filmer's theory. First published a s Tory propaganda long after his death.)
— (1991) *Patriarcha and Other Writings*, ed. J.P. Sommerville, Cambridge: Cambridge University Press.(Includes the writings listed above, edited from the manuscripts and original editions.)

Florenskii, Pavel Aleksandrovich (1882-1937)

A figure of genius in the history of twentieth-century Russian religious philosophy, Florenskii did much to influence the directions of subsequent Russian thought, both within the Soviet Union and abroad in the Russian diaspora. Florenskii's originality is most noticeable in his chief philosophical work, Stolp i utverzhdenie istiny (The Pillar and Foundation of Truth) (1914), a somewhat eclectic and romantic work in which he sets forth his basic tenets in epistemology and sophiology. The work, which was his doctoral dissertation, represents a decisive rejection of rationalist and Western-orientated religious philosophy and theology in favour of a more concrete and experiential methodology.

1 Life

Florenskii was born in 1882 in Yevlakh, Azerbaijan, to a Russian father and an Armenian mother, both of a liberal secular orientation indifferent to religion. His own personal journey to devout religious practice, which culminated in theological studies (1904-8) and ordination to the Orthodox priesthood (1911), came only gradually and began, as he states in his memoirs, with an early fascination with the aesthetic form of nature that matured in a lifelong interest in natural science and mathematics. Declining an offer to pursue advanced studies in mathematics upon graduation from Moscow University (1904), where he studied under the noted mathematician N.V. Bugaev, Florenskii, to the dismay of family and friends, chose to enrol at the Moscow Theological Academy whose faculty he himself was to join (1908).

Bolshevik repression after the Russian Revolution brought about a change of direction in both his professional activities and his philosophical thought. With the forced closure of the Moscow Theological Academy, Florenskii was, owing to his scientific talents, still able to collaborate in various Soviet undertakings, including the Commission for the Electrification of Soviet Russia. His 1927 invention of a noncoagulating machine oil was even called 'dekanite' by the Soviets, in commemoration of the tenth anniversary of the Bolshevik Revolution. It was during this time that Florenskii shifted his philosophical interest to aesthetics and the philosophy of language. Refusing to renounce the priesthood, he was exiled in 1933 to Siberia and then in 1934 to the Solovki Island concentration camp in the White Sea, where he was executed by firing squad in 1937, contrary to official Soviet data which for decades listed the year of his death as 1943.

2 Theodicy: epistemology and sophiology

The first period of Florenskii's philosophical development reaches its climax in his already noted master-work, which, even according to his critic G. Florovskii, is the most characteristic work of the religious renaissance during Russia's short-lived Silver Age at the beginning of this century (see Russian Religious-Philosophical Renaissance). Florenskii subtitled his study 'The Experience of Orthodox Theodicy in Twelve Letters', indicating the root motivation inspiring the development of his reflections. One might say that *Stolp i utverzhdenie istiny* constitutes a form of intellectual autobiography in which Florenskii's own inner struggle for truth is articulated and justified. Indeed, the justification of the mind's claims to know truth lies at the core of Florenskii's own unique understanding of theodicy. After an initial discussion of his point of departure - concrete experience - he considers the divisions characteristic of a fallen world (along with the partial truths about the world) as facts crying out for Ultimate Truth that can undergird reality, imparting integrality to it.

Postulating 'living religious experience as the sole legitimate method for understanding dogma', Florenskii seeks to rejuvenate intellectual thought beyond confessional Orthodox lines towards a true existential appreciation of the whole of reality. Orthodox theologians as diverse as S.N. Bulgakov, J. Meyendorff and A. Schmemann have all followed his lead on this point. His stress on the immediateness of concrete experience also influenced other Russian philosophers like A.F. Losev, whose own work has similarities to Husserlian phenomenology.

Florenskii's aim is to foster dialectical thinking, which he conceives as living, unmediated thought unlike the 'schooled', rationalistic variety that prescinds from concrete experience. His emphases in cognition are an offshoot of the Slavophile theory of integral knowledge, first developed by I.V. Kireevskii and A.S. Khomiakov, then continued by V.S. Solov'ëv (see Slavophilism §1; Solov'ëv, V.S. §1). The whole thrust of Florenskii's epistemological query is to shed light on the experience of truth as gained in lived contact with reality. He

approaches the topic from various angles, finally defining truth as an ‘intuition-discursion’ in which the immediate givenness of truth is not blunt or blind, but is instead infused with intelligibility and *ratio*. Florenskii in this fashion offers a dynamic understanding of the principle of identity, making ’otherness’ constitutive of identity through a process of adoption (*usvoenie*) and assimilation (*upodobenie sebe*), thus grounding it in the principle of sufficient reason. Comparative analysis reveals similar (although subsequent and independent) insights on these themes in the work of such diverse and seminal thinkers as Heidegger and Whitehead.

Florenskii’s epistemological study of the experience of truth sets the stage for his metaphysical worldview, which, borrowing a term from the history of patristic theology, he fashions as *homoousian* philosophy or a philosophy of consubstantiality in opposition to a *homoiousian* one of mere similarity. The whole thrust of Florenskii’s metaphysics is to lay out the fundamental truth of pan-unity (*vseedinstvo*) at the root of all being. All created beings are not atomized units in isolation, but are consubstantial with one another. Cognition thereby enjoys an ontological moment in which knower and known are truly united in opposition to all representationalist theories of knowledge.

Florenskii transcribes his metaphysics into a sophiological key, holding all being to be nothing but a symbol of Sophia, which, for him, is an all-embracing reality linking both Creator and creature together and is considered variously as the ‘great root of the total creature’, the ‘guardian angel of creation’ and the ‘eternal spouse of the Word of God’, among other designations. As an attempt to address the ontological problem of the relations obtaining between Creator and creature, Florenskii’s sophiology, however, raises a host of problems on its own. In particular, critics (for instance N.O. Lossky and J. Meyendorff) have charged him with both Gnosticism and pantheism, since his conception of Sophia as a ‘fourth hypostatic element’ seems to compromise God’s freedom in creation as well as efface the ontological difference between God and creation (see Gnosticism; Pantheism). Others (for instance Slesinski) more sympathetic to Florenskii suggest that a more careful analysis of love as a central category of his metaphysics of consubstantiality can obviate these difficulties.

3 Anthropodicy: aesthetics and philosophy of language

If the major concern of *Stolp i utverzhdenie istiny* is the justification of the claims of truth, Florenskii makes the specific truth about the human person the focus of his later works, which he dedicates to concrete metaphysics or ’anthropodicy’. The centrality of art and language for the meaning of the human person is the main theme of this endeavour, the human person and the world being expressions of the spiritual in the sensual or empirical order of being. Being for Florenskii is no longer Sophia, but rather ‘symbol’ or ‘icon’, ontologically conceived as a dynamic interchange between the knower and symbolized reality, visually in the case of art and verbally in that of language, wherein the symbol is not a sign of an absent reality, but its very presence. Florenskii defines symbol as ‘being which is greater than itself’, and thus understands it as a manifestation or energy of being without exhausting its essence.

An heir to the linguistic school of W. von Humboldt, Florenskii centred his studies on the dynamic aspect of language as a pining of the spirit to express itself and, accordingly, was sympathetic to avant-garde poetic theory. From his university years, he enjoyed a close friendship with Russian Symbolist poets, A. Belyi in particular. There were also theological roots to Florenskii’s philosophy of language. The controversy (1912) over the ‘glorification of the name’ (*imiaslavie*) among Athonite monks regarding the immediate presence of God in his name had a decisive bearing on the development of Florenskii’s thought. Theological concerns also motivated his studies in aesthetics and the philosophy of cult in which the meaning of iconography and the significance of liturgical action are primary themes.

The chief works in which he explores these ideas are *U vodorazdelov mysli (At the Watersheds of Thought)* (1990), *Ikonostas (Iconostasis)* (1972), and a series of lectures on the philosophy of cult now published under the heading of *Iz bogoslovskogo nalsediia sviashchennika Pavla Florenskogo (From the Theological Heritage of the Priest Pavel Florenskii)*. Not published during Florenskii’s lifetime because of the political climate, these studies largely lay dormant even after his posthumous rehabilitation (1956). *Glasnost’* and the fall of communism reversed this situation. A complete publication of all his works remains to be achieved.

ROBERT SLESINSKI

List of works

Florenskii, P.A. (1914) *Stolp i utverzhdenie istiny (The Pillar and Foundation of Truth),* Moscow: Izdatel'stvo 'Pravda', 1990, 2 vols; trans. B. Jakim, *The Pillar and Ground of the Truth*, Princeton, NJ: Princeton University Press, 1997.(Florenskii's best-known work, detailing his epistemology and sophiology.)

Florenskii, P.A. (1915) *Smysl idealizma (The Meaning of Idealism)*, Sergiev Posad. (Provides Florenskii's original reading of Plato.)

Florenskii, P.A. (1922) *Mnimosti v geometrii (The Imaginary in Geometry),* Moscow: Pomor'e; repr. Munich: Otto Sagner, 1985.(Florenskii offers a defence of the Ptolemaic cosmological worldview of Dante's *Divine Comedy* in the last section of this work.)

Florenskii, P.A. (1972) *Ikonostas (Iconostasis)*, in *Bogoslovskie trudy (Theological Studies)* 9: 80-148; integral trans., Crestwood, NY: St Vladimir's Seminary Press, 1996.(A key work in the aesthetics of iconography. The previously unpublished manuscript dates to 1922.)

Florenskii, P.A. (1977) *Iz bogoslovskogo naslediia sviashchennika Pavla Florenskogo (From the Theological Heritage of the Priest Pavel Florenskii)* in *Bogoslovskie trudy (Theological studies)* 17: 85-248.(Written from 1918 to 1922, this work treats the philosophy of cult.)

Florenskii, P.A. (1990) *U vodorazdelov mysli (At the Watersheds of Thought),* Moscow: Izdatel'stvo 'Pravda'. (The original manuscript, itself incomplete, was written over 1917-22, and comprises various studies on the philosophy of language. It includes his noted monograph on inverse perspective. Another volume with the same title was published by YMCA-Press, Paris, 1985, but contains only articles on art, including his monographs on inverse perspective and the *Ikonostas*.)

Florenskii, P.A. (1992) *Detiam moim: vospominan'ia proshlykh dnei (To My Children: Reminiscences of Past Days)*, Moscow: Moskovskii rabochii, 1992.(The original manuscript was written intermittently between 1916 and 1925. Appended to this autobiography are Florenskii's own genealogical investigations and his letters to his family written from imprisonment.)

Florenskii, P.A. (1993) *Analiz prostranstvennosti i vremeni v khudozhestvenno-izobrazitel'nykh proizvedeniiakh (An Analysis of Space and Time in Works of Fine Art)*, Moscow: Izdatel'skaia gruppa 'Progress'. (This contains his lectures at the Higher Artistic-Technical Studios [VKHUTEMAS], 1924-5.)

Florenskii, P.A. (1994) *Sochineniia v chetyrekh tomakh (Compositions in Four Volumes)*, vol. 1 Moscow: Izdatel'stvo 'Mysl''.(A collection of his articles from 1903-9 along with Florenskii's résumé (*c*.1925-6) of his own thought. Volume 2 is to include subsequent articles from 1903-33 with volumes 3 and 4 containing *Stolp i utverzhdenie istiny* and *U vodorazdelov mysli* respectively.)

Fludd, Robert (1574-1637)

Fludd is a marginal figure in the mainstream development of philosophy in seventeenth-century England, but of some importance in the development of an esoteric and mystical philosophy which took the form of an 'underground' movement, Rosicrucianism. Rejecting the various types of scholastic philosophy that were still dominant in his day, Fludd drew on Neoplatonist and Renaissance sources in an effort to redirect learning in what he took to be a Christian direction. His writings centre around a search for hidden connections between a purely intelligible realm and the realm of sensation.

Robert Fludd was born in Kent in the south of England. After a period at St John's College, Oxford, he studied medicine, chemistry and the occult sciences in continental Europe, where he was employed as a tutor to noble families. He returned to England in 1604 and studied medicine at Christ Church, Oxford. Despite his rejection of the current Galenist orthodoxies, he was admitted a Fellow of the Royal College of Physicians, and pursued a form of holistic medicine in which magnetism and psychic healing played a significant role. From 1619 onwards he was engaged in various controversies with Gassendi, Kepler, Mersenne and others.

Fludd assumed a continuity or even an identity between ancient and Christian thought, to the extent that the whole of ancient thought must be shown to anticipate Christianity, even down to points of detail such as the doctrine of the Trinity. In setting out this account he relies very extensively on Hermetic texts, which he maintains date from remote antiquity, despite the fact that Isaac Casaubon had shown in 1614 that they were actually composed well into the Christian era. Much of his work takes its bearings from commentary on the book of Genesis, having as its aim the reconciliation of Scripture with natural philosophy. Fludd pursued this project in a way which had two distinctive features. First, he read Genesis as showing that light and dark are the two basic principles from which everything else follows. God created the universe by contracting into himself, thereby creating darkness, then expanding outwards again in the form of light. Fludd relied heavily on the metaphorical connotations of light and dark, associating them directly with God and Satan. The second distinctive feature of his approach is that it depends as much, if not more, on pictorial representation as on verbal description. The latter is insufficient if we are to capture the deep, hidden relations between the world of sensation and the intelligible reality that underlies it, and pictorial representation is able to capture such mysteries as the Trinity in a way that verbal description is not. Here Fludd believed he had discovered the key to knowledge that Kabbalists, Rosicrucians and various Hermetist sects had been seeking (see Hermetism; Kabbalah).

With this key, Fludd proceeded to unlock hidden antipathies and sympathies, using pairings of terms that mirrored the fundamental dichotomy between light and darkness in his exploration of various harmonic and magnetic phenomena. All natural phenomena are to be construed ultimately as manifestations of the one light-dark contrast, but Fludd interpreted this claim sometimes reductively (for example, in terms of a contrast between heat and cold, the universal effects of which were displayed by means of a primitive thermometer), and sometimes metaphorically and analogically, seeking parallels and similarities rather than simply trying to explain one thing in terms of another.

Fodor, Jerry Alan (1935-)

Jerry Fodor has been one of the most influential figures in the philosophy of mind, the philosophy of psychology, and 'cognitive science' through the latter part of the twentieth century. His primary concern has been to argue (vigorously) for a certain view of the nature of thought. According to this view, thinking is information processing within 'the language of thought'. The mind can be understood as a computer, which directs action with the aid of internal representations of the world.

1 Fodor's view of the mind

Like several other philosophers, Fodor in the 1960s and 1970s defended a functionalist view of the mind (Fodor 1968; see Functionalism). Functionalism makes possible a physicalist worldview but does not seek simply to reduce sciences such as psychology to physics. The computer model of the mind has been central to functionalism. Fodor, however, developed a more literal application of this model than other functionalists.

For Fodor, the value of the computer model lies in the light it sheds on reasoning, belief, planning and other intelligent thought-processes. (He does not see functionalism as a way of explaining the first-person 'feel' of experience.) Fodor claims that thinking is performing computational operations on mental representations. These inner representations form a system with many of the basic properties of a language, so the system can be called 'the language of thought' (Fodor 1975). This inner language is not identical to any public language, such as English. Rather, it is used in learning public languages. Thus the language of thought is innate (see Language of thought).

Fodor holds that to believe that limes contain vitamin C, for example, is to have in one's head a certain sentence-like formula in the language of thought. A formula is a belief that limes contain vitamin C in virtue of both its internal causal role, which makes it a belief rather than a hope or desire, and also in virtue of connections to the external world, which determine its content. These formulas are made up of mental 'terms' with their own properties of meaning and reference. The terms combine to generate the truth-condition of the whole. There are also 'implicit' beliefs which follow trivially from the explicitly represented ones, but only explicitly represented beliefs contribute to thought processes.

Though the inner formulas have semantic properties, their causal contributions to thought depend only on their formal or 'syntactic' properties; these are the properties relevant in computational processes. Indeed, these semantic properties depend partly on the nature of the thinker's environment, and what is outside the head cannot directly affect the production of behaviour. None the less, Fodor insists that there are many psychological generalizations that are naturally and perhaps necessarily expressed in terms of the semantic content of thoughts.

For some time Fodor posited an inner code with representational properties, but did not have a theory of how such representation was possible. He has tried to solve this problem with his 'asymmetric dependence' theory of meaning (Fodor 1990). This is a variety of informational or indicator semantics, based on causal and law-like connections between thoughts and their objects (see Semantics, informational). We cannot simply say that whatever can cause a representational state is represented by that state, since then error would be impossible. Fodor's proposal is that an inner symbol 'horse' represents horses if occurrences of this symbol are reliably caused by horses, and the only other things that can cause occurrences of this symbol do so *because* of the connection between the 'horse' and horses.

These are the central elements of Fodor's view, but he has contributed to many other topics. He has defended the 'automomy' of higher-level sciences against reductionism (Fodor 1975). He has outlined a 'modular' view of mind, in which specialized and partially autonomous mental faculties are responsible for perception and some other features of cognition (Fodor 1983). Recently he has also attacked the holism influential in much twentieth-century epistemology and semantics (Fodor and LePore 1992; see Holism: mental and semantic; Modularity of mind).

2 Debates

Fodor's programme is so ambitious that nearly every aspect of his view has been controversial. Some have found

the idea of an inner language to be either incoherent (as languages are essentially public) or empirically unmotivated. For others more sympathetic to the representationalist approach, Fodor has never resolved a tension between his stress on the 'syntactic' nature of mental processes, and his insistence on the importance of semantic properties in psychological explanation.

This problem is magnified by his acceptance of the view that the semantic properties of thought depend on factors external to the agent's body. For some years Fodor and others tried to develop a purified 'narrow' way of ascribing thoughts which would not distinguish physically identical agents who happen to inhabit different environments. More recently he has argued that there is no real problem here after all; intentional laws are 'implemented' in computational processes, and these are two distinct levels of description. For some, however, Fodor has never resolved this problem (Loewer and Rey 1991; see Content: wide and narrow).

Another problem, which Fodor himself has explored, concerns learning (Fodor 1981). Psychologists have often seen various types of learning as hypothesis testing. Fodor adopts a realist interpretation of this view: such theories must posit internal representations of hypotheses and the evidence used to choose between them. But how then can new *concepts* be learned? To test hypotheses about the concept 'cigar' we must already be able to represent internally the various possibilities for its meaning. Consequently we cannot acquire genuinely new representational capacities from experience; all we can do is rearrange and rename concepts we already have. So the representational approach, in Fodor's hands, leads to a view in which much of what appears to be learning is actually nothing of the sort (see Nativism §3; Concepts).

Fodor's 'asymmetric dependence' theory of meaning has not been widely accepted. (Loewer and Rey 1991). Some have raised problem cases, while others (like the present author) are more generally sceptical about the counterfactuals that Fodor's theory posits. Fodor says that the inner symbol 'horse' represents horses if it is reliably caused by the presence of horses, and other things only produce occurrences of the symbol because of the connection between the symbol and horses. This dependence is present-tense rather than historical. But why is it the connection between 'horse' and horses that explains the other connections? As a consequence of physical facts about the wiring connecting the symbol to the senses, some horses can cause occurrences of the symbol. These same facts explain why other objects, such as cows, sometimes cause occurrences of the symbol. The connection which explains the others is a connection between the symbol and a certain sensory appearence. If so, the connection between the symbol and horses is not fundamental in the way that Fodor claims. These debates are complex, however, and no naturalistic theory of meaning has generated wide acceptance.

For many years Fodor claimed that, with the demise of behaviourism, the computational, symbolic approach was the only genuine research programme we had for studying cognitive processes. Hence it was 'the only game in town' as a theory of the general nature of thought. The rise of connectionism during the 1980s partially undermined this claim. The connectionist model of thought is based upon parallel and simultaneous interactions, of a very simple nature, between neuron-like elements. Connectionism has closer links to the brain sciences than Fodor's more abstract approach, and it does not posit language-like inner symbols. Fodor has been an outspoken critic of connectionism (Fodor and Pylyshyn 1988), but there are now other games in town, and in this new context there is ongoing debate over the merits of the symbolic approach (see Connectionism).

Fonseca, Pedro (1528-99)

Called in his own time 'the Portuguese Aristotle', Pedro da Fonseca was a sixteenth-century Jesuit philosopher and theologian. Schooled as a Thomist, Fonseca was a master of the Greek, Arabic and scholastic traditions, which enabled him to pursue his own independent line on various issues dealt with by Aquinas and Aristotle. As reflected in his publications, his chief accomplishments were in logic and metaphysics. He authored two very important and widely used works: a clear, comprehensive and systematic textbook in logic (Institutionum dialecticarum) and an edition of Aristotle's Metaphysics with translation plus explanation and commentary. A third shorter work of introduction to logic (Isagoge philosophica) was also influential.

1 Life

Pedro da Fonseca (Petrus Fonseca) was born at Cortiçada (now Proença-a-Nova) in Portugal. He entered the Society of Jesus in 1548. After a period of noviciate, in 1551 he enrolled at the newly founded University of Évora, where between 1552 and 1555 he studied theology and also taught philosophy in 1552-3. From 1555 to 1561, he taught philosophy in the Jesuit-directed College of Arts at the University of Coimbra. During this last period, Fonseca promoted the idea of a *Cursus Conimbricensis* which later became a reality through the efforts of fellow Jesuits at Coimbra (see Collegium Conimbricense). From 1561 to 1564 he served the Jesuits in various administrative roles. In 1570 he received his doctorate in theology at Évora and became chancellor there. From 1572 to 1582 he served in Rome as general assistant for the Jesuit Province of Portugal. While in Rome, he worked with others on a 'Plan of Studies' (*Ratio studiorum*) which was later adopted by the Society of Jesus. Returning to Portugal in 1582, he became a Jesuit superior in Lisbon and then a visitor for the province. In 1592, he was again in Rome, a delegate to the fifth General Congregation of the Society, which among other things legislated that the Jesuits should follow Aristotle in philosophy. He died in Lisbon.

2 Logic

Fonseca's contribution to philosophy is in two main parts, logical and metaphysical. In logic, he authored two important works. The first was *Institutionum dialecticarum libri octo (Eight Books of Dialectical Instructions)*. Published at Lisbon in 1564 and re-edited fifty-two more times by 1625, it was adopted as a textbook, especially by the Jesuits, throughout Europe, America and the Far East. The second work was a much shorter *Isagoge philosophica (Philosophical Introduction)*, which was published initially in 1591 and re-edited eighteen times up to 1623. More than a simple commentary on the *Isagōgē* of Porphyry (§§2, 5), Fonseca's book was a new introduction to the Organon of Aristotle (§4). After a brief preface and a proem, he devoted six chapters to a general treatment of universals, particulars and the abstraction of one from the other. Then over five chapters he treated the five universals (genus, species, difference, property and accident) of Porphyry. Finally, in Chapter 12 he treated 'certain other species of universals [connected with the logic of the Trinity and the Incarnation] which pagan philosophers did not know' (*Isagoge philosophica*: 61).

The *Institutionum dialecticarum* is a systematic presentation of Aristotelian formal logic. Book 1 consists of thirty-two chapters in which Fonseca treats successively of the necessity, the names and the nature of logic. He distinguishes it from dialectic as Aristotle speaks of this in his *Topics* and then goes on to discuss nouns, verbs and signs (formal and instrumental as well as natural and conventional). After discussion of concepts as signs, he treats terms as equivocal (including analogical) and univocal, concrete and abstract, connotative and absolute, common and singular, transcendent and supertranscendent, positive and negative, contradictory and non-contradictory, as well as of first and second intention, and so on. Book 2 concerns the universal and covers much of the same matter (for example, genus, species and so on) treated in his *Isagoge*, plus the ten categories of Aristotle. Book 3 deals with various types of proposition. Book 4 covers division and Book 5 treats of definition. Book 6 deals with consequence, argumentation, invention and judgment, syllogisms, enthymemes, and induction. Book 7 is concerned with demonstration, dialectical reasoning, 'places' (or seats of argument), teaching procedure and the art of disputation. Book 8 mainly concerns fallacies, but Fonseca also treats supposition, ampliation, restriction and appellation in detail. As for the Aristotelian character of the *Institutionum dialecticarum*, Ferreira Gomes ([1564] 1964: xlvi-xlvii) notes that in them Aristotle is cited 600 times and he quotes a 1597 editor to the effect that Fonseca's work covers the Aristotelian logic so well that it makes Aristotle's own work, apart from its

historical value, almost useless (see Logic, Renaissance).

3 Metaphysics

Comprising four quarto volumes, Fonseca's *In libros Metaphysicorum Aristotelis Stagiritae (Commentary on the Books of Aristotle's Metaphysics)* contains a critical Greek text which he himself established from the best available manuscripts and printed editions. Through the four volumes, in a right-hand column matching the Greek to the left, he has given a fine Latin translation. An explanation of the text follows each chapter and then commentary 'by way of question' (*per modum quaestionis*) on most of the chapters through the first nine books of the *Metaphysics*. Published posthumously, Books 10, 11, and 12 continue to give the Greek and Latin plus the explanation, while Books 13 and 14 give only the text in the two languages. The questions, which contain Fonseca's own thought on subjects metaphysical, were developed in scholastic fashion. After asking a particular question, Fonseca, through a series of 'sections', presents objections and opinions, clarifies terms and concepts, gives and proves his own answer, and then returns to answer the objections raised in support of other views. Extraordinarily well versed in the earlier Greek, Arabic and scholastic traditions, Fonseca wherever possible follows the lead of Aristotle and Thomas Aquinas, but with a decided independence.

After rejecting opinions which hold that the subject of metaphysics is God, Aristotelian 'separate substances', or being in the categories, Fonseca says that the first and adequate subject of metaphysics is being in so far as it is common to God and creatures (*In libros Metaphysicorum* IV c.1 q.1 s.3). Understood in this way, being is analogous, although as said of species within one genus or of individuals within one species it is univocal. Between God and creatures, between created substance and accidents, between different classes of accident, and between real being and being of reason, being is analogous by analogies both of proportion and of attribution. As God is related to his being, so in proportion a created substance is related to its being. Likewise, as created substance and its being are related, so in proportion is an accident related to its being. Again, as one kind of accident is disposed to its existence so is each other kind of accident to its existence. And as real beings are disposed to their being, so beings of reason are to theirs (*Metaphysicorum* IV c.2 q.1 s.5, 7). An analogy of attribution obtains among accidents as an analogy of two things to a third (that is, created substance), while between accidents and substance it is analogy of one to the other. The same is true of beings of reason among themselves and then in comparison with real being; for beings of reason do not depend less upon real beings than do accidents upon substance. Again, a creature is being only by attribution or reference to God. Pursuing this, Fonseca distinguishes between formal and objective concepts. A formal concept is an 'actual likeness' (*actualis similitudo*) of a thing that is understood, produced by the intellect in order to express that thing. An objective concept is that thing which is understood in so far as it is conceived through the formal concept. Both the formal and the objective concept of being are one, but not perfectly so for the reason that they do not prescind perfectly from the concepts of the members which divide being. Being as such is transcendent as are also the concepts of thing, something, one, true and good (*Metaphysicorum* IV c.2 q.2 s.1, 4-5; q.5 s.2) (see Being).

In God alone there is a perfect identity of essence and existence. In every creature, essence is distinct from existence, but not as one thing from another. Rather, says Fonseca, a created essence is as distinct from its existence as a thing from its ultimate intrinsic mode. In this opinion, he tells us, he is following Alexander of Hales and Duns Scotus (§12) (*Metaphysicorum* IV c.2 q.3 s.4). It is possible that here Fonseca has also to some extent anticipated the Suárezian doctrine of modes.

Excluded from the subject of metaphysics are accidental beings (*entia per accidens*) and beings of reason. An accidental being, in the sense excluded, is a juxtaposition of two or more beings which lack any (intrinsic) relation to one another (*Metaphysicorum* IV c.1 q.1 s.3). Beings of reason are those which exist only inasmuch as they are objects of understanding. Within such beings of reason, as they stand in contrast with mind-independent real beings, Fonseca distinguishes a proper being of reason from one which is fictitious. Properly taken, a being of reason is one whose being depends upon the understanding in such way that it can still be said of real beings, for example, the concepts of genus, species, and the like. A fictitious being as such is a being whose essence depends upon the understanding in such way that it cannot be said of any real being, for example, a chimera, a goat-stag, or the like (*Metaphysicorum* IV c.7 q.6 s.5).

Fontenelle, Bernard de (1657-1757)

Despite his considerable historical importance and vast output of literary, critical and philosophical works, Fontenelle did not make original contributions to philosophy. He popularized a modern view of nature, and raised doubts about institutionalized religions and unexamined theistic beliefs. As a champion of science and secularization, Fontenelle was extremely influential; his Entretiens (Conversations) of 1686 were quickly translated into many languages and became one of the basic texts of the early Enlightenment.

1 Life and work

Bernard Le Bovier ('Boyer') de Fontenelle was born in Rouen, France, and received a Jesuit education at the Collège de Bourbon. Early literary fame and the support of Pierre and Thomas Corneille, his uncles, gained him access to the intellectual and social circles of Paris. He was elected to the Academie Française in 1687 and became its perpetual secretary ten years later. He died in Paris shortly before his one-hundredth birthday.

Fontenelle wrote poems, tragedies, novels, comedies and libretti for operas (set to music by Jean-Baptiste Lully). The pieces written for the stage met with only moderate success. Apart from satires, dialogues and critical essays, he composed so-called 'lettres galantes' and maintained a far-reaching correspondence with the leading thinkers of his time.

As a historian of science, Fontenelle distinguished himself through his exhaustive report of the Academy's work since its inception, the *Histoire de l'Académie royale des sciences depuis 1666 jusqu'en 1699* (1720-33). Several multivolume sequels followed at regular intervals. Parallel to these chronicles, Fontenelle drafted almost seventy eulogies on deceased members, the *Éloges des académiciens* (1708, 1722 and following), reviewing and summarizing their achievements.

Interested in the infinitesimal calculus, Fontenelle wrote a preface to a work by d'Hôpital and an account of recent mathematical research, the *Éléments de la géometrie de l'infini* (1727). In his philosophy of nature, Fontenelle defended theories developed by others instead of developing new ideas; in his philosophy of religion, he was a sceptic inspired by de Huet, Thomassin and Spinoza (see Huet, P.-D. §2; Spinoza, B. de §14). But as a popularizer and advocate, Fontenelle became an influential champion of science and secularization, and the leading pioneer of the early French Enlightenment.

2 Philosophy of nature

Fontenelle's most famous work is the 1686 *Entretiens sur la pluralité des mondes habités (Conversations on the Plurality of the Inhabited Worlds)*. This popular account of astronomy and natural philosophy consists of five dialogues, to which a sixth dialogue was added in a revised edition of 1687. The conversations begin with the assertion that our planetary system is not the only one in the universe: there are others whose suns are the fixed stars. Earth and the planets revolve around the sun; the celestial motions are described by the Copernican model and explained by Cartesian vortices. The second dialogue touches on the corpuscular theory of light, an explanation of solar eclipses and the possibility of space flight, and turns into a discussion about the moon. An examination of lunar features reveals the moon to resemble Earth in significant respects. Considering this, Fontenelle speculates that Earth's satellite is inhabited. This claim is expanded in the third dialogue. The microscope reveals a compelling ubiquity of life even in the tiniest water droplet and on the smallest stone in our world. Since Earth and other heavenly bodies are alike in their appearances, we can treat them alike in what is not apparent as well, as long as evidence to the contrary is lacking. Operating with this strong principle of analogical reasoning, Fontenelle argues for the possibility of life on other worlds. The fourth and fifth dialogues are imaginative summaries of the current knowledge about planets and stars. The supplementary sixth dialogue contains an update of recent astronomical and geological discoveries and a reflection on probability and analogical reasoning.

What makes this work interesting is Fontenelle's persuasive presentation of an entirely modern worldview. Anthropocentrism is obsolete; humans do not reside at the centre of a small enclosed universe, but are just one among many possible civilizations in a boundless cosmic ocean in which worlds are scattered like so many islands. It is doubtful that humans are the pinnacle of creation; far more advanced beings may exist. Anthropomorphism

fails to fathom how such extraterrestrials might look; the universe is too fertile and diverse for even the boldest imagination. But despite its diversity, the cosmos is a well-ordered system: a principle of order generates a maximum of effects with a minimum of means. These means are mechanical and law-governed, and modern science can account for them. The *Entretiens* proved to be extremely influential in the European thought of the eighteenth century; Fontenelle's conception of nature was picked up by subsequent *philosophes* and even influenced Kant's cosmology.

Throughout his life, from the *Entretiens* to the *Lettre à Basnage de Beauval* (1699) to his last work, the *Théorie des tourbillons cartésiens* (1752), Fontenelle defended Cartesian vortices against the rise of Newton's universal gravitation. Since whirls of matter presuppose a medium, Fontenelle argued for the existence of a cosmic ether in which heavenly bodies move. Apart from that, however, Fontenelle did not feel much allegiance to Cartesianism. Whereas Descartes excluded teleology, Fontenelle emphasized purposive explanations of nature. Fontenelle rejected Malebranche's occasionalist interpretation of Descartes in the *Doutes sur le système physique des causes occasionelles* (1686b), favouring a physical influx model of causality (see Occasionalism).

3 Philosophy of religion

On the surface, God seems to be an indispensable part of Fontenelle's universe, but it remains unclear what God is. Like Spinoza, Fontenelle subscribed to the idea that there is a fundamental conformity between the order of reason and the order of nature (see Spinoza, B. de §§5-6). This conformity permits humans to know nature but does not lead to knowledge of God. Like the Deists, in his correspondence with Leibniz (1701-4) Fontenelle took the principle of order to be immanent to nature: matter, not God, determines the laws of motion (see Deism). The nature of God's existence cannot be known; at the very least, the Cartesian proofs do not work (*Sur l'existence de Dieu* 1724). Fontenelle remained evasive about these issues through fear of censorship and persecution. At any rate, the utopian society envisaged in the clandestine novel *Histoire des Ajaoiens* (*c*.1680, attributed to Fontenelle) is devoid of institutionalized monotheism, and instead embraces pantheism.

Continuing themes of Fontenelle's work were his impatience with superstition and his criticisms of religious credulity. He derided pagan superstition in the *Dialogues des morts* (1683), and in *La Comète* (1681), a comedy written after the appearance of Halley's Comet in 1680, ridiculed the widespread belief that passing comets have negative effects. According to *De l'origine des fables* (1679, published 1724 as part of *Sur l'histoire*) and the *Histoire des oracles* (1686c), religions stem from an anthropological and a social source. Human imagination triggered by an ignorance of natural phenomena, and successful imposters exploiting human gullibility were the first causes of religious beliefs.

In the essay *Traité de la liberté de l'âme* (written 1700, seized and burnt on parliamentary order, republished anonymously in the 1743 collection *Nouvelles libertés de penser*), Fontenelle raised even more serious questions. Not only is God unknowable, not only do religions derive from human imagination, but it also appears that divine foreknowledge and human freedom are incompatible. Although Fontenelle makes an ostensible attempt at their reconciliation, the actual result of his examination is different: divine foreknowledge implies fatalism; human freedom is possible only without a prescient God.

MARTIN SCHÖNFELD

List of works

Fontenelle, B. de (1742-6) *Oeuvres*, Paris: Brunet; repr. 1758-66, Amsterdam, 12 vols. (The first edition of collected works, published during Fontenelle's lifetime, originally in eleven volumes. The subsequent Amsterdam edition was augmented by an additional volume.)

Fontenelle, B. de (1818) *Oeuvres complètes*, ed. G.-B. Depping, Paris; repr. Geneva: Slatkine, 1968, 3 vols.(The second edition of Fontenelle's works; not complete, despite its title. Arranged by categories: science and mathematics in volume 1, philosophy and history in volume 2, poetry and fictional works in volume 3.)

Fontenelle, B. de (1989-) *Oeuvres complètes*, ed. A. Niderst, Paris: Arthème-Fayard, 7 vols.(The supposedly definitive edition. Fontenelle's works are arranged chronologically as well as topically.)

Fontenelle, B. de (1970) *The Achievement of Bernard Le Bovier de Fontenelle*, ed. L. Marsak, New York and London: Johnson Reprint Corporation.(The only English anthology of Fontenelle's works. Contains

photographic reproductions of the first English editions of Fontenelle's *Plurality of Worlds* (London 1688) and *The History of Oracles* (London 1688). It also contains a new translation of the *Discourse Concerning the Ancients and the Moderns* and short selections from other works.)

Fontenelle, B. de (1679) *De l'origine des fables (On the origin of myths)*, in *Oeuvres complètes* ed. G.-B. Depping, vol. 2; ed. A. Niderst, vol. 3.(An attack of religious superstitions in the form of a brief essay.)

Fontenelle, B. de (*c*.1680) *Histoire des Ajaoiens (History of the Ajaoiens)*.(Novel with antireligious overtones, the fictional account of a benevolent and atheist society.)

Fontenelle, B. de (1681) *La Cométe (The comet)*, in *Oeuvres complètes* ed. G.-B. Depping, vol. 3; ed. A. Niderst, vol. 4.(Comedy written after the appearance of Halley's Comet in 1680.)

Fontenelle, B. de (1683) *Dialogues des morts anciens et modernes (Dialogues of the dead in antiquity and modernity)*, in *Oeuvres complètes*, ed. G.-B. Depping, vol. 2.(Thirty fictional dialogues, some among ancient figures, such as Anacreon and Aristotle, others between ancients and moderns, such as Socrates and Montaigne, and again others among moderns, such as Cortez and Montezuma.)

Fontenelle, B. de (1686a) *Entretiens sur la pluralité des mondes habités*, in *Oeuvres complètes*, ed. G.-B. Depping, vol. 2; trans. H. Hargreaves, *Conversations on the Plurality of Worlds*, Berkeley and Los Angeles, CA: University of California Press, 1990.(Fontenelle's main work, which has appeared in almost one hundred editions since its first publication. The 1990 translation contains an introduction by N.R. Gelbart.)

Fontenelle, B. de (1686b) *Doutes sur le système physique des causes occasionelles (Doubts on the physical system of the occasional causes)*, in *Oeuvres complètes*, ed. G.-B. Depping, vol. 1; ed. A. Niderst, vol. 1. (Philosophical treatise; a defence of Cartesianism and a critique of Malebranche and Arnauld.)

Fontenelle, B. de (1686c) *Histoire des oracles (History of oracles)*, in *Oeuvres complètes*, ed. G.-B. Depping, vol. 2; ed. A. Niderst, vol. 2.(One of Fontenelle's main works in the philosophy of religion. Consists of two parts, 'That Oracles were not at all given by demons', and 'That Oracles did not cease to exist at the coming of Jesus Christ'. A characteristic work of the early French Enlightenment and a sequel to *De l'origine des fables*.)

Fontenelle, B. de (1699) *Lettre de M. Fontenelle à M. Basnage de Beauval (Letter from Fontenelle to Basnage de Beauval)*, in *Oeuvres complètes*, ed. A. Niderst, vol. 3.(Fontenelle defends himself against the critic of Entretiens, and insists that the sun rotates around its own axis. Both observational and theoretical evidence support the hypothesis of solar rotation: the movement of the sun spots and the fact that the vortical centre of a revolving cosmic liquid cannot remain at rest.)

Fontenelle, B. de (1700) *Traité de la liberté de l'âme (Treatise on the freedom of the soul)*, in *Oeuvres complètes*, ed. G.-B. Depping, vol. 2; ed. A. Niderst, vol. 3.(Short philosophical essay, published anonymously, involving implicit objections to Church doctrine.)

Fontenelle, B. de (1701-4) 'Correspondence with Leibniz', in *Oeuvres complètes*, ed. A. Niderst, vol. 3.(An exchange of eleven letters touching on astronomy, chemistry, the composition of fire, mathematics, Leibniz's *Essai de Science Numerique* and Fontenelle's own works.)

Fontenelle, B. de (1708, 1722-) *Éloges des académiciens (Eulogies of the Members of the Academy)*, in *Oeuvres complètes*, ed. G.-B. Depping, vol. 1.(Fontenelle eulogized sixty-nine Academicians, among them Bernoulli, Boerhaave, d'Hôpital, Leibniz, Malebranche, Newton and Tschirnhaus.)

Fontenelle, B. de (1720-33) *Histoire de l'Academie royale des sciences depuis 1666 jusqu'en 1699 (History of the Royal Academy of Sciences from 1666 to 1699)*.(A multivolume work published in Paris 1720-33. Fontenelle explains the research and discoveries of the new generation of scientists and natural philosophers in a non-technical language. The preface to the *Histoire* is reprinted in Depping, volume 1.)

Fontenelle, B. de (1724) 'Sur l'existence de Dieu' (On the existence of God), in *Oeuvres complètes*, ed. A. Niderst, vol. 3.(A short philosophical essay. It is unlikely that matter caused life and thus, the existence of life suggests that God exists. None the less, metaphysical proofs of God's existence aspiring to certitude, such as the argument from design, are problematic.)

Fontenelle, B. de (1727) *Éléments de la géometrie de l'infini (Elements of the geometry of the infinite)*, in *Oeuvres complètes*, ed. G.-B. Depping, vol. 1; repr. Paris: Editions Klincksieck, 1995.(Book-length treatise on the philosophy of mathematics that contains a systematic theory of the infinite. The 1995 edition is a photographic reproduction of the 1727 text, with Fontenelle's responses to objections; also has new introduction by M. Blay and A. Niderst.)

Fontenelle, B. de (1752) *Théorie des tourbillons cartésiens (A Cartesian Vortex Theory)*, in *Oeuvres complètes*, ed. G.-B. Depping, vol. 1.(A longer philosophical treatise. Fontenelle's defence of the Cartesian vortices involves general reflections on physics, an attempt at coming to terms with Descartes' theory, and arguments to support a solar vortex and the ethereal atmosphere enveloping celestial objects.)

Forcing

The method of forcing was introduced by Paul J. Cohen in order to prove the independence of the axiom of choice (AC) from the basic (ZF) axioms of set theory, and of the continuum hypothesis (CH) from the accepted axioms (ZFC = ZF + AC) of set theory (see set theory, axiom of choice, continuum hypothesis). Given a model M of ZF and a certain $P \in M$*, it produces a 'generic'* $G \subseteq P$ *and a model N of ZF with* $M \subseteq N$ *and* $G \in N$*. By suitably choosing P, N can be 'forced' to be or not be a model of various hypotheses, which are thus shown to be consistent with or independent of the axioms. This method of proving undecidability has been very widely applied. The method has also motivated the proposal of new so-called forcing axioms to decide what is otherwise undecidable, the most important being that called Martin's axiom (MA).*

1 The method: three basic lemmas

Let *M* be a countable transitive model of ZFC (see Set theory §7, terminology and notation from which will be used throughout). Let $P \in M$. Then $p, q \in P$ are called *compatible* if there is an $r \in P$ with $p \subseteq r$ and $q \subseteq r$. $D \subseteq P$ is *dense* if it is nonempty and for every $p \in P$ there exists a $q \in D$ with $p \subseteq q$. If *F* is a set of dense sets, *G* is *generic* for *F* if: (1) $q \in G$ whenever $q \subseteq p$ and $p \in P$, (2) any $p, q \in G$ are compatible, and (3) for any $D \in F$, $G \cap D \neq \emptyset$. *G* is *generic* for *M* if *G* is generic for $F = \{D \subseteq P \mid D \text{ dense and } D \in M\}$ (which appears uncountable to *M* but is really countable). If $F = \{D_0, D_1, D_2, \ldots\}$ is countable, choosing $p_0 \subseteq p_1 \subseteq p_2 \subseteq \ldots$ with $p_k \in D_k$, as is possible since each D_k is dense, $G = \{q \in P \mid q \subseteq p_k \text{ for some } k \in \omega\}$ is generic. A generic *G* generally cannot be an element of *M*.

For example, let *P* be the set of all functions *p* with domain a finite subset of ω and range a subset of 2. (Recall that an ordinal is identical with the set lesser ordinals, so $2 = \{0, 1\}, \omega = \{0, 1, 2, \ldots\}$.) Then *p*,*q* are compatible unless they 'disagree' in the sense that there is an $n \in \mathrm{dom}(p) \cap \mathrm{dom}(q)$ with $p(n) \neq q(n)$. For each $n \in \omega$, $D_n = \{p \in P \mid n \in \mathrm{dom}(p)\}$ is dense, since any function *p* not already defined on *n* can be extended to a function *q* that is. Likewise, for any function $f \in M$ from ω to 2, $D_f = \{p \in P \mid p(n) \neq f(n)\}$ is dense, since any function *p* with a finite domain that does not already disagree with *f* can be extended to a function that *q* does. In the example, if all the $D_n, D_f \in F$ for all *n* and *f* as above, then $g = \cup G$ will be a function *g* from ω to 2 disagreeing with each $f \in M$. Hence $g \notin M$.

Cohen's method associates to any given countable transitive model *M* of ZFC, and any given $P \in M$, and any given $G \subseteq P$ generic for *M* another countable transitive model $N = M[G]$ of ZFC, with $M \subseteq M[G]$ and $G \in M[G]$, in such a way that three basic lemmas stated below hold. For various choices of *P* the three basic lemmas can be used to show that $M[G]$ will be a model of various hypotheses Δ. Before stating the three basic lemmas it should be remarked that the best way to gain an intuitive understanding of their rather technical content is to see how they are used in applications (as in §§2,3).

Minimality lemma The $b \subseteq M$ with $b \in M[G]$ will be precisely those $b \subseteq M$ of the form $\delta_G(c) = \{x \mid (p, x) \in c \text{ for some } p \in G\}$ for some $c \in M$. Note that such a $\delta(c)$ would certainly have to belong to *any* countable transitive model *N* with $M \subseteq N$ and $G \subseteq N$. It is sometimes said that while *M* cannot 'know' about which *p* will get into *G* or about which $b \subseteq M$ will get into $M[G] - M$ (since *G* and such *b* simply do not exist in *M*), *M* does contain 'codes' *c* for such *b*, which can immediately be 'decoded' by δ_G once *G* is given. Especially important are the *canonical* code $x^{\#} = P \otimes x$ for any $x \in M$, and the *canonical* code $\Gamma = \{(p, p) \mid p \in P\}$ for the generic set. It is fairly easily checked that for any generic *G*, $\delta_G(x^{\#}) = x$ and $\delta_G(\Gamma) = G$.

Truth lemma If $\Phi(\delta_G(a), \delta_G(b), \ldots)$ holds inside $M[G]$, then there is some $p \in G$ such that $\Phi(\delta_H(a), \delta_H(b), \ldots)$ holds inside $M[H]$ for *any H* generic for *M* with $p \in H$. Such a *p* is said to *force* $\Phi(a, b, \ldots)$ over *M*.

Definability lemma To every formula Φ there may be associated a formula $\Phi^{\dagger}$ such that given any $p \in P$ and any $a, b, \ldots \in M$, then $\Phi^{\dagger}(p, a, b, \ldots)$ holds in *M* if and only if *p* forces $\Phi(a, b, \ldots)$ over *M*. Note that it follows, by the axiom of separation, that for any set *A* that is an element of *M*, the set $\{(p, a, b, \ldots) \mid u, v, \ldots \in A \text{ and } p \text{ forces } \Phi(a, b, \ldots)\}$ is an element of *M*. It is sometimes said that though *M*

cannot 'know' which *p* will get into *G* or whether a given Φ will come to hold in $M[G]$, at least Φ will come to hold in $M[G]$ only if it is forced to hold by some *p* that gets into *G*, and *M* 'knows' which *p* will, if they get into *G*, force Φ to hold in $M[G]$.

2 Application to the continuum hypothesis

To treat CH, let now ξ, η be the ordinals inside *M* that appear to *M* to be ω_1, ω_1 (really, they are, like *M* itself, countable), and vary the example of §1 by letting *P* be the set of all functions *p* with domain a finite subset of $\eta \otimes \omega$ and range a subset of 2. If *G* is generic, $g = \cup G$ will be a function from $\eta \otimes \omega$ to 2, and there will be functions g_ρ from ω to 2 for $\rho < \eta$, given by $g_\rho(n) = g(\rho, n)$. Since for distinct $\rho, \sigma < \eta$, $D_{\rho,\sigma} = \{p \in P \mid (\rho, n), (\sigma, n) \in \mathrm{dom}(p) \text{ and } p(\rho n) \neq p(\sigma n)\}$ is dense, these functions will be distinct not only from any function in *M*, but from each other. So ~CH will hold inside $M[G]$ provided ξ, η still appear to $M[G]$ to be ω_1, ω_2.

The proviso means there is no function *e* or *f* in $M[G]$ with $\mathrm{dom}(e) = \omega$, $\xi \subseteq \mathrm{ran}(e)$ or $\mathrm{dom}(f) = \xi$, $\eta \subseteq \mathrm{ran}(f)$. Cohen showed that for this it suffices that *P* should appear to *M* to have a certain property, the *countable chain condition* (CCC). Here an *antichain* is an $A \subseteq P$ such that p, q are incompatible for any two $p, q \in A$, and CCC is the property that any antichain is countable. (It ought logically to be called the '*no* countable *anti*chain condition', but the illogical terminology is well established.) To sketch why this suffices to rule out the existence of an *e* as above (the case of an *f* as above being similar), suppose $e \in M[G]$ is a function with $\mathrm{dom}(e) \subseteq \omega$.

By the minimality lemma, $e = \delta_G(c) \in M$ for some $c \in M$. By the truth lemma there is a $p_0 \in G$ forcing '*c* is a function with $\mathrm{dom}(c) = \omega^\#$ and $\xi^\# \subseteq \mathrm{ran}(c)$', and by restricting attention to those $p \in P$ such that $p_0 \subseteq P$, we may suppose that every $p \in P$ forces this. By the definability lemma $E = \{(p, n, \rho) \in P \otimes \omega \otimes \xi \mid p \text{ forces 'the value of function } c \text{ for argument } n^\# \text{ is } \rho^\# \text{'}\} \in M$.

Now consider how things appear inside *M*, where *P* appears CCC. For each $n \in \omega$ let $C_n = \{\rho < \xi \mid (p, n, \rho) \in E \text{ for some } p \in P\}$, and let $C = \cup\{C_0, C_1, C_2, \ldots\}$. Intuitively, C_n is the set of 'candidates' to become the output of the function for input *n*, while *C* is the set of 'candidates' to belong to the range of the function. For each $n \in \omega$ and $\rho \in C_n$ choose a $p(n, \rho)$ with $(p(n, \rho), n, \rho) \in E$, and let $A_n = \{p(n, \rho) \mid \rho \in C_n\}$. Note that if (p, n, ρ), $(q, n, \sigma) \in E$ and $\rho \neq \sigma$, then p, q are incompatible (since they force things which cannot both hold in $M[G]$ for any *G*). Hence any two elements of any A_n are incompatible. By CCC, each A_n, hence each C_n and hence *C* are all countable. Since $\xi = \omega_1$ (or so it appears inside *M*), *C* is bounded by some $\sigma < \xi$. Back outside *M* this means that $e = \delta_G(c)$ will be a function with $\mathrm{ran}(e) \subseteq \sigma < \xi$, contrary to assumption that $\mathrm{ran}(e) = \xi$.

To show that the set of functions *p* with domain a finite subset of $\omega_2 \otimes \omega$ and range a subset of 2 (which set is what *P* appears inside *M* to be) is CCC, the *delta system theorem* from combinatorial set theory is used (see Set theory §4): given an uncountable set *A* of incompatible elements of *P*, there must be a finite *b* and an uncountable $B \subseteq A$ such that $\mathrm{dom}(p) \cap \mathrm{dom}(q) = b$ for all $p, q \in B$. Thus the restrictions of the $p \in B$ to *b* give uncountably many distinct functions from *b* to 2. But if *k* be the number of elements in *b*, the number of such functions is just 2^k, which is finite, a contradiction.

3 Other applications

Among many other uses of the method of forcing, the following may be cited: If CH fails, the number of cardinals between $\aleph_0$ and c can be almost anything from one (hypothesis CH') to c (hypothesis CH#). Moreover, as regards the function $\exp\alpha = 2^\alpha$, all kinds of combinations are possible: One can have $\exp\aleph_0 = \exp\aleph_1 = \aleph_2$, or one can have $\aleph_0 = \aleph_2$ and $\exp\aleph_1 = \aleph_3$, and so on.

Cohen himself proved the independence of AC from ZF, combining forcing with an earlier construction used to prove independence of AC from a variant of ZF allowing 'individuals'. Indeed, Cohen's proof established the independence of the weaker axiom of dependent choice DC. The independence of AC from ZF+DC can similarly be established. Indeed, a whole range of implications of AC have been studied and questions as to which imply which and which are independent of which have been settled.

Many undecidability results have also been obtained by forcing in combinatorial set (see Set theory §4). For instance, any combination of CH or ~CH with SH or ~SH is consistent, where SH is Suslin's hypothesis.

Many undecidability results have also been obtained by forcing in the related areas of descriptive set theory and large cardinal theory (see Set theory §§5,7). In particular, adding the hypotheses IC, MC, … of the existence of inaccessible, measurable, … cardinals to ZFC does not decide CH (or SH or any other such combinatorial hypothesis).

As for the hypothesis AM (resp. PM) that all (resp. all projective) sets of reals are Lebesgue measurable, in a noteworthy early extension of Cohen's work, Robert Solovay established consistency relative to ZF+IC for DC+AM and AC+PM. (Also projective uniformization PU fails in one of the models involved.) For the related hypothesis RM (resp. RSM) that there is a measure with all the properties of Lebesgue measure except invariance (resp. with all the properties of Lebesgue measure except invariance, plus superadditivity), Solovay proved the consistency of RSM (which is known to imply CH#) relative to ZFC+MC, and of MC relative to ZFC+RM (which is known to imply ~CH and ~CH').

In many applications, it is convenient to work with a generalization of the notions of §1: one starts with an arbitrary set *P* and an arbitrary partial order $\leq$ on it, and defines p, q to be compatible if there is an $r \in P$ with $p \leq r$ and $q \leq r$, $D \subseteq P$ to be dense if it is nonempty and for every $p \in P$ there exists a $q \in D$ with $p \leq q$, and so on. In §1 only the special case where $\leq$ is the subset relation $\subseteq$ was considered, but the general case easily reduces to this special case, since setting $[p] = \{r \in P \mid r \leq p\}$ one has $[p] \subseteq [q]$ if and only if $p \leq q$.

4 Martin's axiom

D.A. Martin and Solovay, by a method involving reduction of several successive applications of forcing by $P \in M$, $Q \in M[G]$, $R \in M[G][H] \ldots$ to a single application, showed the consistency with ~CH (indeed with CH') of a consequence of CH called *Martin's axiom* (MA). MA is the most basic example of a *forcing axiom*, asserting that anything of a certain kind that could be forced to hold already does hold. MA asserts that for any *P* that is CCC and any set *F* of fewer than continuum many (c) dense subsets of *P*, there exists a *G* generic for *F*. (Assuming CH, c amounts to $\leq \aleph_0$, and the existence of *G* in this case was essentially proved in §1.)

To give at least one example, consider the usual order on the reals R (as in Set theory, end of §4, beginning of §5): $S \subseteq \mathbf{R}$ is *open dense* if for every rational a, c with $a < c$ there are rational d, e with $a \leq d < e < c$ such that $b \in S$ for every real *b* with $d \leq b \leq e$. It is easily proved that the intersection of finitely many open dense sets is open dense and hence not empty. It is an important theorem of modern analysis and topology that the intersection of countably many open dense sets is not empty. It is an interesting consequence of MA that an intersection of fewer than continuum many open dense sets is not empty.

To derive this consequence, let *X* be a set of fewer than continuum many open dense sets, to prove $\cap X \neq \emptyset$. Consider the set *P* of triples (a, c, Y) where $Y \subseteq X$ is finite, where a, c are rational with $a < c$, and where $b \in \cap Y$ for every real *b* with $a \leq b \leq c$. Consider the partial order on *P* given by $(a, c, Y) \leq (d, e, Z)$ if and only if $Y \subseteq Z$ and $a \leq d < e \leq c$. Then (a, c, Y) and (a', c', Y') are compatible if and only if $\max(a, a') < \min(c, c')$. For then letting $Z = Y \cup Y'$, using the fact that $\cap Z$ is open dense, there are rational d, e with $\max(a, a') \leq d < e \leq \min(c, c')$ such $b \in \cap Z$ for every real *b* with $d \leq b \leq e$, and so $(a, c, Y), (a', c', Y') \leq (d, e, Z)$.

In particular, (a, c, Y) and (a', c', Y') are always compatible if $d = d'$ and $e = e'$, and since there are only countably many possibilities for d, e, any set of pairwise incompatible elements of *P* must be countable, and the partial order is CCC. Also, for any $(a, c, Y) \in P$ and any $S \in X$, letting $Z = Y \cup \{S\}$ and using the fact that $\cap Z$ is open dense, there are rational d, e with $a \leq d < e \leq c$ such that $b \in \cap Z$ for all real *b* with $d \leq b \leq e$, and so $(a, c, Y) \subseteq (d, e, Z)$ and $S \in Z$. Thus for each $S \in X$ the set $Q_S = \{(d, e, Z) \mid S \in Z\}$ is dense in *P*. A similar argument shows that for each $n = 1, 2, 3, \ldots$, the set $R_n = \{(d, e, Z) \mid d - e < 1/n\}$ is dense in *P*. Applying MA, there is a $G \subseteq P$ generic for $\{Q_S \mid S \in X\} \cup \{R_n \mid n = 1, 2, 3, \ldots\}$.

Let α be the least upper bound of $\{a \mid (a, c, Y) \in G \text{ for some } c, Y\}$ and let γ be the greatest lower bound of $\{c \mid (a, c, Y) \in G \text{ for some } a, Y\}$. Since any elements $(a, c, Y), (a', c', Y') \in G$ are compatible, and so have $\max(a, a') < \min(c, c')$, one has $\alpha \leq \gamma$. For any *n* there is an $(a, c, Y) \in G \cap R_n$, whence

$(\alpha - \gamma) \leq (a - c) < 1/n$, and since this holds for all $n = 1, 2, 3, \ldots$, one has $\alpha = \gamma$. For any $S \in X$ there is an $(a, c, Y) \in G \cap Q_s$, and since $a \leq \alpha \leq \gamma$ one has $\alpha \in S$, and since this holds for all $S \in X$, one has $\alpha \in \cap X$, completing the proof.

Of the most interesting consequences of CH, about half follow from MA alone, about half are refutable assuming MA+~CH, which also has other interesting consequences ($\sum_2^1$-measurability, SH). By contrast, ~CH by itself has few interesting consequences. MA+~CH thus provides a rather attractive alternative to CH, though there is no generalization of MA+~CH to higher cardinals comparable to the generalized continuum hypothesis (GCH) generalizing CH. Saharon Shelah has introduced forcing axioms considerably strengthening MA+~CH and implying CH'.

5 On the proofs of the three basic lemmas

Only the briefest sketch of the highly technical proofs of the three main lemmas may be given here. It cannot be emphasized strongly enough that the best way to gain an intuitive understanding of the three main lemmas is to see how they are used in applications (as in §§2,3), which hardly ever refer back to details of their proofs.

First, while the notion of coding given in §1 is that generally needed in applications, for the proofs a different notion of coding is needed, one providing codes for *all* elements of M[G] and not just for those that are subsets of *M*. Correspondingly, a different notion of decoding is needed: $\delta_G(c) = \{\delta_G(b) \mid (p, b) \in c \text{ for some } p \in G\}$. This definition appears circular but is really an instance of a legitimate method of definition of operations on sets by $\in$-recursion, a generalization of the method of definition of operations on ordinals by $<$-recursion (or transfinite recursion, as in Set theory §4): As an operation on ordinals may be defined by defining its value for ρ in terms of its values for $\sigma < \rho$, so an operation on sets may be defined by defining its value for *c* in terms of its values for $b \in c$. With this alternate definition of decoding, M[G] is simply defined to be $\{\delta_G(c) \mid c \in M\}$, and to establish the minimality lemma what remains to be proved is that M[G] so defined is a model of ZFC. To prove this, one makes heavy use of various necessary and sufficient conditions for being a model of this or that axiom of set theory (see Set theory §7). For instance, to handle the axiom of pairing, one must show that M[G] is closed under the operation of pairing: One must show that if $a, b \in M$, then there is a $c \in M$ such that $\delta_G(c) = \{\delta_G(a), \delta_G(b)\}$. In this case it is easily checked that the required *c* is provided by $P \otimes \{a, b\}$.

Second, while the definition of forcing given in §1 is that generally needed in applications, for the proofs a different definition is needed initially, though the two definitions will be proved equivalent *eventually*. This alternate definition of *p* forces Φ is by induction on the complexity of the formula Φ: (i) *p* forces 'not Φ' if and only if no *q* with $p \subseteq q$ forces Φ; (ii) *p* forces 'Φ and Ψ' if and only if *p* forces Φ and *p* forces Ψ; (iii) *p* forces 'for all *x*, $\Phi(x)$' if and only if for all *c*, *p* forces $\Phi(c)$; and so on. What is most difficult is to define *p* forces Φ for the *simplest* formulas '$c = d$' and '$c \in d$': The definition for these simplest formulas requires a highly technical $\in$-recursion. With the alternate definition of forcing, the definability lemma is almost immediate.

Towards establishing the truth lemma, and with it the equivalence of the alternate definition of forcing to the definition given in §1, one notes that it follows from clause (i) of the alternate definition of forcing that the set $D = \{p \mid p \text{ forces } \Phi \text{ or } p \text{ forces } \ \Phi\}$ is dense, and it follows from the definability lemma that $D \in M$. Hence for any generic *G* there will be a $p \in G \cap D$. What remains to be proved is that if $p \in G$ and *p* forces $\Phi(a, b, \ldots)$, then $\Phi(\delta_G(a), \delta_G(b), \ldots)$ holds in M[G]. This is proved by induction on the complexity of the formula Φ.

Forgiveness and mercy

Forgiveness and mercy are regarded as virtues in many moral and religious traditions, although different traditions will emphasize different aspects. The Christian tradition, for example, tends to emphasize purity of heart as the core of the virtue of forgiveness, whereas the Judaic tradition gives priority to the social dimension of reintegration into the covenanted community. Forgiveness involves the overcoming of anger and resentment, and mercy involves the withholding of harsh treatment that one has a right to inflict. Both allow for healing, but some critics would say that this healing may come at too high a price. Forgiveness, if carried to extremes, can lapse into servility, entailing a loss of self-respect. There are similar paradoxes associated with mercy, particularly in the context of punishment; too strong an emphasis on mercy can lead to a departure from justice. Clearly, though both forgiveness and mercy are obvious virtues, there are difficulties in putting them into practice in the complex situations that make up everyday reality.

1 Forgiveness and mercy analysed

Forgiveness and mercy are typically regarded as virtues. As virtues, they represent moral demands that may not be satisfied by actions alone, but require certain motives or dispositions of character. Obligations are different; the obligation to keep a promise has been discharged when the promise is kept, whatever the motive. The virtue of mercy is not manifested merely in an act of leniency, however, but only if that act flows from a character motivated by compassion or some other appropriate motive (love of God, perhaps). The forgiving or merciful person will typically respond to others in characteristic ways, of course, and the person receiving the response might well claim to have been forgiven or shown mercy. Ordinary language is not always precise here. What has been done exemplifies a virtue, however, only if it is the product of a merciful or forgiving heart.

With respect to forgiveness, the disposition of heart may be all that is required. Bishop Butler, one of the most insightful of all philosophical writers on forgiveness, characterized the forgiving person simply as one who has, on moral or religious grounds, forsworn resentment - forsworn the very personal response of anger or sometimes even hatred that one naturally (and perhaps properly) initially feels when one believes that one has been wronged by another. The person who no longer resents will obviously avoid certain actions - namely, those without any basis other than resentment. Since grounds other than resentment may be the basis for harsh treatment of a wrongdoer, however, the demand for harsh treatment may well survive even a sincere and complete act of forgiveness. It would be consistent, for example, for a rape victim to forgive the person who has assaulted her - to harbour no resentment at all - but still demand that he be legally punished. She might make this demand not because of any residual anger or hatred that she personally feels, but rather because she believes that punishment (for reasons of crime control, perhaps) is a socially necessary response to such serious rights violations. The person truly manifesting the virtue of forgiveness is not to be confused with the unvirtuous person who is indifferent to or complicitous in wrongdoing, and who is willing to cooperate in the further corruption of the wrongdoer or of the life of the community.

Although a good case can be made that forgiveness may be understood solely in terms of such internal dispositions as the forswearing of resentment, mercy seems different in at least two important ways: first, the person in a position to bestow mercy (for example, a judge) need not have been personally wronged and thus need not have any feelings of resentment to overcome through forgiveness; and second, although mercy as a virtue necessarily involves dispositions of character (such as compassion), it also requires - in a way that forgiveness does not - a public manifestation. One can forgive another in one’s heart of hearts, but one cannot show mercy to another in one’s heart of hearts. This is because mercy has its primary life in an institutional context (typically, but not necessarily, legal) where one has the right or duty to inflict a certain level of harsh treatment on another, but refuses to do so, imposing instead a less harsh treatment or no harsh treatment at all.

Because mercy necessarily involves a mitigation or abandonment of hard treatment, it may easily be confused with mere leniency. When the fallen knight begs for mercy, he knows that the rules of chivalric combat give the victor the right to kill the vanquished and he is asking that the victor waive that right. If the victor does waive it, and spares the life of the vanquished, we may say - speaking casually - that mercy was shown, because ordinary language often allows us to confuse mercy with leniency. Surely, however, the victor reveals the *virtue* of mercy

only if he acts from such an appropriate motive as compassion or love of God. Or consider, in a legal context, an example from Shakespeare's *Measure for Measure*: when Isabella begs Angelo to show mercy to her brother Claudio, Angelo's false promise to free Claudio in exchange for sexual intercourse with Isabella is an insincere offer of leniency, but no kind of an offer of mercy in any sense in which mercy may be regarded as a virtue.

But are forgiveness and mercy properly regarded as virtues? They are both responsive, in a moral or legal context, to genuine cases of wrongdoing for which the wrongdoer is responsible. In this they are unlike both excuse and justification, concepts with which they are sometimes confused. The person with a valid excuse (insanity, perhaps) is not responsible for wrongdoing. The person with a valid justification (self-defence, perhaps) establishes that, initial appearances to the contrary, there was (all things considered) no ultimate wrongdoing. In these cases there is nothing to resent and nothing for which to demand punishment or other harsh treatment, and thus the avoidance of resentment and demands for harsh treatment is obviously required by elementary rationality and justice. Forgiveness and mercy, however, get their main life in cases where there *is* wrongdoing for which the wrongdoer is responsible, and thus where either resentment or the demand for punishment might well seem justified. But this is what makes both forgiveness and mercy problematic candidates for moral virtues: they demand that we avoid psychological responses and actions that seem not only understandable, but perhaps actually justified by a proper respect for rights and justice.

2 Forgiveness and self-respect

There are, of course, many things to be said in favour of forgiveness: it allows us to show our genuine commitment to love and compassion (central virtues in the Christian tradition) in really hard test cases, cases where we have been personally wronged or injured; it allows us to check excessive self-importance or self-love, tendencies that incline us to overdramatize some of the wrongs done to us (a point well made by Simone Weil and others); it allows us to avoid the self-poisoning effects of resentment itself (a poison graphically described by Nietzsche (§§8-9)); it may confer considerable social benefits, such as the avoidance of feuds and vigilante activities; and it allows us to maintain our most valued personal relationships. This last benefit arises from the fact that, since each of us will sometimes wrong the people that mean the most to us, there will be times when we will want to be forgiven by those whom we have wronged. Seeing this, no rational person would desire to live in a world where forgiveness was not seen as a healing virtue.

In spite of all these splendid fruits that may be born of forgiveness, it is hard to regard it as an unqualified virtue. Although one of course wants to guard against excessive self-importance or self-love, are not certain assertions of the value of the self - the assertion of one's moral rights, for example - morally permissible, perhaps even morally mandatory? If one thinks that self-respect, in contrast to servility, is a virtue, is it not plausible to argue that one important way in which this self-respect may sometimes be shown is through resenting those persons who maliciously inflict wrongs upon us? We show our moral respect for others in feeling indignation when they are wronged. May we not show moral respect for ourselves by feeling resentment when we are wronged? And if we do not, what does this show? That we are manifesting the virtues of love and forgiveness, or simply that we are servile persons with low self-esteem, unable to demand the respect that we deserve?

Forgiveness thus creates a problem: can it be conceptualized as a virtue in such a way that it does not immediately collapse into the vice of servility? One way out of this tension, perhaps, is to make forgiveness conditional on a change in the wrongdoer: namely, repentance. When we are wronged, one of the things most threatening to our self-respect is the symbolic message that the wrongdoer seems to be conveying about us: the message that we matter less than the wrongdoer and thus may simply be used, like an object, for the wrongdoer's own purposes. This is a message that one's own self-respect prompts one to resist, and resentment of the wrongdoer is our primary emotional way of expressing such resistance. As much as we might like to follow Augustine's counsel that we should 'hate the sin and not the sinner', it is difficult to follow this counsel when the wrongdoer remains attached to the wrongdoing. But what if the wrongdoer seeks to break this attachment - as shown by sincere repentance? Then there is no longer an endorsement of the insulting and humiliating message contained in the wrongful conduct, and the wronged person can now forgive and join with the wrongdoer in condemning the act from which the wrongdoer is now severed. In this case forgiveness and self-respect seem obviously compatible. For this reason it is not surprising that repentance, which opens the door to forgiveness by allowing the wronged person a self-respecting retreat from resentment, has loomed large in the moral literature on forgiveness. It is also

not surprising that repentance (and the purity of heart at which it aims) has been regarded within some (but not all) religious traditions as a precondition of God's forgiveness of sinners.

Of course, not everyone would agree that resentment of wrongdoers is essentially tied to human self-respect. (The whole conceptual framework of resentment and self-respect may not even apply to God, of course, and thus divine forgiveness may have to be understood in totally different terms.) A person who grounds their self-respect in something other than the regard of other people will perhaps see resentment as a natural response but also as a dangerous temptation - a temptation to rely on something that is an improper basis for self-respect. Such a person may well see forgiveness - even in the absence of repentance on the part of the wrongdoer - as a way of restoring full and properly founded self-respect. Persons who do not derive their self-respect from treatment by other people may, of course, rely on a variety of different sources and worldviews to support a sense of their own worth - for example, the moral elitism of a Socrates ('Why should I care if the ignorant seek to harm me?') or the belief of Christians that their self-respect is grounded in the fact that God loves them.

3 Mercy and justice

Mercy is also a concept that is capable of generating tension and paradox; this is particularly so in the context of punishment, where it initially seems most at home. If a certain punishment is required by justice, representing what the wrongdoer in justice deserves, then it would seem to be an injustice to depart from that punishment. We are fond of using the slogan that 'justice should be tempered with mercy', yet it is unclear that such a slogan represents morally wise counsel. If it is simply a somewhat misleading way of demanding proper individuation to guarantee that justice is finely tuned and thus truly done, then one can hardly have any deep quarrels with it. If it counsels an actual departure from justice (an injustice), however, then what it counsels seems manifestly unvirtuous. It is for this reason that Kant feared the role of compassion in the criminal law and argued that the sovereign's power of pardon (a dramatic kind of legal mercy) is one of the most dangerous of all sovereign powers because it might tempt the sovereign, out of compassion, to avoid a genuine duty: namely, the doing of justice. It is manifestly illegitimate, Kant argues, for the sovereign or judge to pursue personal and private commitments to compassion when such individuals have explicitly taken on the public responsibility of administering justice.

The tension - perhaps even contradiction - between justice and mercy produces paradoxes even with respect to the idea of divine mercy. Anselm, for example, found it paradoxical that God, who is committed to justice, could through his mercy spare the wicked from the eternal punishment that they deserved.

Perhaps the way out of this paradox, at both the human and the divine level, is to distinguish between two different models of mercy: the criminal law model and the private law model. On the criminal law model, a judge has an obligation (a role responsibility) to enforce just laws by imposing the just sanctions specified. The responsibility of the office precludes appeals to personal compassion, since the very essence of the job is defined in terms of certain specified duties. This criminal law model would, of course, have serious problems as a model for divine justice. God is presumably not like a judge in a criminal case, having the duty to enforce rules that are independent of his will, but is in some sense the author of the rules that are enforced. God is thus not accountable to a constituency in the way a human judge is, and thus does not experience anything that might plausibly be regarded as role responsibility or role conflict. Anselm, however, may have been tempted to see God occupying such a role; his paradox seems to depend upon seeing God caught in the very kind of dilemma that might plague a human judge in a criminal case.

A private law model of mercy, however, might allow us to avoid some of the tensions between mercy and justice at both the human and the divine level. According to this model, mercy is best illustrated not by a judge in a criminal case, but by a private party in a private lawsuit. Shakespeare's *The Merchant of Venice* nicely illustrates this private law model in its portrayal of Portia pleading with Shylock to show mercy to Antonio, a man who has defaulted on a contract and who now, according to the terms of the contract, owes Shylock 'a pound of flesh'. Unlike a judge, Shylock has no duty to enforce any legal rules. Rather, the legal rules of contract give him certain rights, rights that he is free to waive if he chooses. And it is such a waiver, motivated by compassion, that Portia is asking him to consider - a waiver that, since he has only rights and no duties in this situation, could not open him up to a valid charge of injustice or dereliction of duty.

So too, one might say, for God. If God is properly conceived as a being who mainly has rights over his creatures

rather than external (non-self-imposed) duties to them, then perhaps he may show mercy - waiving his right to consign a person to eternal damnation - without being validly charged with injustice. We may now begin to see our way out of at least one paradox about mercy. Others, however, may still be present - for example, what might be called the 'equal protection' paradox raised by Anselm when he wondered how God, a rational being, can consistently show mercy to some who are unworthy while punishing others who are equally unworthy.

Both forgiveness and mercy, because of the tensions they generate, will no doubt remain problematic concepts that will continue to generate rich philosophical and theological discussion. It is an obvious truth, of course, that the virtuous person is one lacking in neither charity (the primary foundation of mercy and forgiveness) nor justice (the primary foundation for resentment and punishment). What is by no means obvious, however, is how these virtues are to be brought into harmony in all the actual complex cases that arise in the moral lives of individuals and communities.

Formal and informal logic

Formal logic abstracts the form of an argument from an instance of it that may be encountered, and then evaluates the form as being valid or invalid. The form is the important thing, rather than the concrete instance of the form. Informal logic, on the other hand, evaluates how an argument is used in a given context of conversation. This more practical, real-world orientation requires more judgment in interpreting what a given text of discourse should be taken to argue.

Formal logic abstracts from the context of use of an argument by seeing an argument as an instance of a form of argument, composed of constants and variables. The constants are defined in a precise way that makes any reference to context unnecessary (see Logical constants). The variables are blanks that are filled in by the component parts of the argument under consideration. Take the argument 'Jane and Dick will not both be elected; Jane will be elected; therefore Dick will not be elected'. In the modern formal logic of propositions, 'and' and 'not' are defined as constants, and 'Jane will be elected' and 'Dick will be elected' are represented using propositional variables, *A* and *B*. The constants 'and' and 'not' are defined as follows:

'*A* and *B*' is true only if both *A* and *B* are true; otherwise it is false.
'not *A*' is true if *A* is false; and false if *A* is true.

Symbolized thus, the argument above about Jane and Dick has the following form:

not(*A* and *B*)
A
Therefore not *B*.

This form of argument is 'valid', meaning that every single instance of it is such that if both premises are true, the conclusion must also be true. Thus formal logic guarantees that a valid argument will never take you from true premises to a false conclusion. This is simply a matter of the form of the argument and the way the constants have been defined. Hence formal logic is an abstract, mathematical discipline - a study of forms.

Formal logic of this mathematical sort, using constants and variables, is a relatively modern development, but the roots of it can be traced back to Aristotle's theory of the syllogism (see Aristotle §5; Logic, ancient §§1-3). A 'syllogism' is an argument made up of three propositions put together in a particular form, of which the following is an example: 'All bears climb trees; all grizzlies are bears; therefore, all grizzlies climb trees'. This kind of argument was ruled valid in Aristotle's theory: *if* the premises are true, then the conclusion must be true too. This does not imply that the premises *are* true. Validity, you could say, is a conditional concept in Aristotle's theory, and the same can be said in modern logic.

Modern formal logic has been centrally concerned with two kinds of arguments. Propositional logic has to do with arguments that are valid or not by virtue of certain constants, such as 'and', 'not' and 'if…, then…', which function as connectives between propositions. Quantifier logic is a sophisticated and powerful system of formal logic that not only encompasses the limited varieties of arguments treated in Aristotle's theory of the syllogism, but also many other more complex arguments depending on 'all' and 'some' (see Quantifiers; Predicate calculus).

Informal logic was also founded as a systematic subject by Aristotle, principally in his *Topics* and *Sophistical Refutations* (see *Topica et Sophistici Elenchi*), but never received the same consistent and more serious attention that formal logic did in the subsequent history of logic. Consequently, it was never developed as a scientific subject in the way that formal logic was. However, it survived in a practical form, in logic textbooks and manuals used for instruction in universities throughout the Middle Ages and into the modern period. Only recently, with the advent of argumentation theory, has there come to be a relatively serious and sustained scholarly attempt to develop informal logic as a subject of research. Yet even at the end of the twentieth century, informal logic is a more practical subject which addresses contextual factors of how arguments are actually used in everyday conversation in a given discourse. Unlike formal logic, informal logic cannot abstract from the context of use of an argument, and must evaluate it as subject to an interpretation of the speaker's discourse as a part of a conversational exchange.

Both formal and informal logic are concerned primarily with the task of evaluating arguments as correct or incorrect, according to standards. Formal logic, as noted above, works by identifying forms and proving them valid or invalid by means of some method of calculation independent of the context in which the argument was used. Applying the formal test to a real argument does involve some informal determining of what kind of argument was meant by the speaker, what its most precise form is, and so forth. But in informal logic such questions of interpretation are a much more central part of the task of evaluation.

Informal logic has to do with the use of an argument in a conversational setting where participants are supposed to contribute to the conversation by making moves appropriate to the current stage of the conversation (see Grice 1975; Pragmatics; Implicature). Different types of conversation can be recognized. For example, van Eemeren and Grootendorst (1984) cite one very important type where the purpose is to resolve a conflict of opinions by verbal means, using arguments. Generally an argument is correct if it contributes to the goal of the conversation, and incorrect if it fails to do so. Some particularly deceptive or misleading types of arguments can even actively interfere with the goal of a conversation, and the most common and dangerous of these are called fallacies (see Fallacies).

Formal languages and systems

Formal languages and systems are concerned with symbolic structures considered under the aspect of generation by formal (syntactic) rules, that is, irrespective of their or their components' meaning(s). In the most general sense, a formal language is a set of expressions. The most important way of describing this set is by means of grammars. Formal systems are formal languages equipped with a consequence operation yielding a deductive system. If one further specifies the means by which expressions are built up (connectives, quantifiers) and the rules from which inferences are generated, one obtains logical calculi of various sorts, especially Frege-Hilbert-style and Gentzen-style systems.

1 Expressions and grammars

A formal language is a set $\mathcal{L}$ of expressions. Expressions are built up from a finite set Σ of atomic symbols or atoms (the 'alphabet' of the language) by means of certain constructors. Normally one confines oneself to linear association (concatenation) '$\circ$' as the only constructor, yielding 'strings' of atoms, also called 'words' (over Σ), starting with the empty word ϵ. Mathematically, the structure obtained is the semi-group freely generated by the alphabet Σ. When $a_1 \circ a_2 \circ \ldots \circ a_n$ with atoms $a_1, a_2, \ldots, a_n$ is written in the usual way as $a_1 a_2 \ldots a_n$, it is assumed that the decomposition of this expression into atoms is unique.

It should be noted that languages based on more than one constructor may well be considered. An example would be Frege's two-dimensional *Begriffsschrift*, which may be viewed as a formal language based on constructors for horizontal and vertical alignment (see Frege 1879). However, since any constructor can be written linearly as a function symbol applied to arguments, the notion of formal languages as based on linear concatenation is sufficiently general. The atomic symbols which form the basis of a formal language are themselves abstract entities, in contrast to the tokens which constitute their individual realizations.

A formal language $\mathcal{L}$ can be investigated from various points of view. One possibility is to specify a device $\mathcal{A}$ that recognizes exactly those words over Σ which belong to $\mathcal{L}$, that is, which enters a certain state if and only if a word of $\mathcal{L}$ is given as an input. When this occurs we say that $\mathcal{A}$ *accepts* $\mathcal{L}$. Such a device is called an 'automaton' (in the mathematical, not the physical sense). The relationship between languages and automata accepting them is studied in automata theory.

A formal grammar $\mathcal{G}$ for $\mathcal{L}$ describes a way to generate the words of $\mathcal{L}$ by means of formal rules, beginning with a special start symbol *S*. A rule (also called a 'production') has the form $u \rightarrow v$, which expresses that in any word of the form $w_1 u w_2$ the part *u* may be replaced by *v*, yielding $w_1 v w_2$. In addition to the atoms of the alphabet Σ under consideration (which are called 'terminals' in formal language theory), rules may contain variables (called 'non-terminals'), among which *S* is distinguished. For example, the grammar

$$S \rightarrow ASA$$

$$S \rightarrow a$$

$$A \rightarrow b$$

generates all words $b \ldots bab \ldots b$ over the alphabet $\{a, b\}$ with equally many instances of *b* on each side of *a*.

Formal languages may be classified by the type of grammar generating them. For example, a language $\mathcal{L}$ is called 'context-free' if it can be generated by a context-free grammar, which is one whose productions always have just a single variable on the left side (as in the example just given). Context-free grammars play a distinguished role in the construction of artificial languages (such as programming languages). However, for the study of (fragments of) natural languages, more complicated ('context-sensitive') types of grammar must be considered. Formal grammars have the same expressive power as computable functions: the computation by a Turing machine can be described by means of a formal grammar; and the generation of words in a formal grammar can be simulated by a Turing machine.

2 Deductive systems

A formal system is based on a formal language $\mathcal{L}$, endowing it with a 'consequence operation' $\mathcal{C}$. This operation

can be specified at different levels of abstraction. In the most general sense, $\mathcal{C}$ is just an arbitrary function transforming subsets of $\mathcal{L}$ into subsets of $\mathcal{L}$. $\mathcal{C}$ is said to be an 'inference operation' if the set of consequences of a set *X* comprises at least *X*.

$$X \subseteq \mathcal{C}(X)(\text{inclusion})$$

The pair $\langle \mathcal{L}, \mathcal{C} \rangle$ is then called an 'inference system'. It is called a 'closure system' if furthermore

$$\mathcal{C}(\mathcal{C}(X)) \subseteq \mathcal{C}(X)(\text{idempotence})$$

and

$$X \subseteq Y \Rightarrow \mathcal{C}(X) \subseteq \mathcal{C}(Y)(\text{monotonicity})$$

are fulfilled. It is called a 'deductive system' if the consequences of a set *X* can be obtained from the finite subsets of *X*, that is, if in addition to the three conditions mentioned,

$$\mathcal{C}(X) \subseteq \bigcup\{\mathcal{C}(Y) \colon Y \subseteq X, Y \text{ finite}\}(\text{compactness})$$

holds. Equivalently, formal systems can be described by a consequence relation $X \vdash A$ between subsets of $\mathcal{L}$ and expressions of $\mathcal{L}$. The four conditions mentioned then become

$$X \cup \{A\} \vdash A$$
$$X \vdash A \Rightarrow X \cup Y \vdash A$$
$$(X \vdash A \text{ for all } A \in Y \text{ and } Y \cup Z \vdash B) \Rightarrow X \cup Z \vdash B$$
$$X \vdash A \Rightarrow Y \vdash A \text{ for some finite } Y \subseteq X.$$

If we confine ourselves to consequences of finite sets *X*, *Y*, *Z*, which in the case of deductive systems is appropriate, these conditions are equivalent to

to $\{A\} \vdash A(\text{identity}) \quad X \vdash A \Rightarrow X \cup \{B\} \vdash A(\text{thinning}) \quad (X \vdash A \text{ and } \{A\} \cup Z \vdash B) \Rightarrow X \cup Z \vdash B(\text{cut})$

which are the basic structural (that is, logic-free) principles of Gentzen-style sequent systems (see Gentzen 1935).

Deductive systems can be given by means of a set Δ of inference rules *R*, where an inference rule is an $(n+1)$-ary relation $R \subseteq \mathcal{L}^n \times \mathcal{L}$. Any $(A_1, \ldots, A_n, B) \in R$ (also written as $A_1, \ldots, A_n \Rightarrow B$) is called an instance of *R*, and $A_1, \ldots, A_n$ are said to be the premises and *B* the conclusion of that instance. If $n = 0$ then the rule $\Rightarrow A$ is called an axiom. If we define $\mathcal{C}_\Delta(X)$ to be the smallest set of expressions in $\mathcal{L}$ containing *X* and closed under the rules in Δ (that is, if $\{A_1, \ldots, A_n\} \subseteq \mathcal{C}_\Delta(X)$, then $B \in \mathcal{C}_\Delta(X)$ for any instance $A_1, \ldots, A_n \Rightarrow B$ of a rule in Δ), then $\langle \mathcal{L}, \mathcal{C}_\Delta \rangle$ is a deductive system, called the rule-based system with respect to Δ.

Conversely, the consequence relation of any deductive system defines a set of rules with respect to which this system can be viewed as a rule-based system. Like grammars, rule-based systems are as powerful as Turing machines: they can be used to express any algorithm.

3 Logical calculi

In logic one considers deductive systems over a language $\mathcal{L}$ whose expressions, called formulas, are built up from certain basic expressions by means of functions, predicates and logical operators. In propositional logic, which for reasons of simplicity is considered here, formulas are built up from a subset $\mathcal{P}$ of $\mathcal{L}$ (the set of propositional letters or propositional variables) and a finite set $\mathcal{S}$ of symbols of the alphabet Σ of $\mathcal{L}$ (the set of propositional connectives). Prominent connectives are 'not' ($\sim$), 'and' ($\wedge$), 'or' ($\vee$) and 'implies' ($\supset$). The two principal ways of specifying a consequence operation $\mathcal{C}$ for such a system are (1) by presenting it as a rule-based system and (2) by formally describing its consequence relation $\vdash$. Other approaches modify or extend the notion of consequence by considering (3) multiple consequences, (4) consequence relations with restricted structural principles ('substructural logics') or (5) the fine structure of proofs.

(1) For a *rule-based system* a set of axioms and a set of inference rules are given. Axioms for a fragment of propositional logic based on conjunction and implication (the so-called 'positive implication-conjunction logic') are, for example, all formulas of the form

$A \supset (B \supset A)$
$(A \supset (B \supset C)) \supset ((A \supset B) \supset (A \supset C))$
$(A \supset (B \supset C)) \supset ((A \wedge B) \supset C)$
$((A \wedge B) \supset C) \supset (A \supset (B \supset C))$.

Inference rules are all instances of the following schema.

$$A, A \supset B \Rightarrow B(modus\ ponens)$$

Rule-based systems of this kind are often called Frege-Hilbert-style systems. Typically, they include a relatively long list of axioms and just a few inference rules (in ordinary propositional logic, just *modus ponens*). The consequence relation ‘ $X \vdash_{\mathcal{C}} A$’ corresponding to the consequence operator $\mathcal{C}$ is called ‘derivability from assumptions’.

(2) In contradistinction to this approach, Gentzen-style sequent systems formulate the desired properties of a consequence relation ‘ $X \vdash_{\mathcal{C}} A$’ as formal rules of inference. In a sequent system of propositional logic based on the connectives ‘ $\wedge$’ and ‘ $\supset$’ the above rules of identity, thinning and cut are typically postulated as logic-free structural rules, in addition to the following logical rules.

to $X \cup \{A\} \vdash B \Rightarrow X \vdash A \supset B(\supset\text{-introduction right})$ $X \vdash A,\ X \cup \{B\} \vdash C \Rightarrow X \cup \{A \supset B\} \vdash C(\supset\text{-introduction left})$ $X \vdash A,\ X \vdash B \Rightarrow X \vdash A \wedge B(\wedge\text{-introduction right})$ $X \cup \{A, B\} \vdash C \Rightarrow X \cup \{A \wedge B\} \vdash C(\wedge\text{-introduction left})$

Formally, this is just a specification of a rule-based system with respect to a more complicated language. Rather than a set of formulas $\mathcal{L}$ over $\mathcal{P}$ and $\mathcal{S}$ one considers a language $\mathcal{L}'$, whose expressions are ‘sequents’ of the form ‘ $X \vdash A$’, where $A \in \mathcal{L}$ with *X* finite. The deductive system $\mathcal{C}'$ over $\mathcal{L}'$ is then given by the rules stated. (Actually, to capture the idea of finite *sets X* in *expressions* ‘ $X \vdash A$’, one has to consider lists instead and to add special inference rules.) Intuitively, $\langle \mathcal{L}', \mathcal{C}' \rangle$ states features of the relation $\vdash_{\mathcal{C}}$ which are intended to describe properties of the connectives of $\mathcal{S}$. So a Gentzen-style sequent system is a rule-based system with a consequence relation $\vdash_{\mathcal{C}'}$ that can be viewed as a description of a deductive system with a consequence relation $\vdash_{\mathcal{C}}$ such that $X \vdash_{\mathcal{C}} A$ if and only if $\emptyset \vdash_{\mathcal{C}'} (X \vdash A)$.

(3) In the Gentzen tradition, more complicated types of consequence relations ‘ $\vdash$’ have been investigated that do not completely fit the pattern described. One such approach is to consider consequence relations with a set of formulas appearing on the right side of ‘ $\vdash$’ (‘multiple-conclusion logics’ or, sometimes, ‘Scott consequence relations’; see Multiple-conclusion logic). The intended reading is disjunctive: ‘ $X \vdash Y$’ means that under the assumptions *X* at least one element of *Y* holds (although that cannot be formally derived!). (Gentzen (1935) has proposed this idea to formulate sequent calculi for classical logic in which each connective obtains a ‘natural’ meaning via introduction rules for it on the right or left side of the turnstile without the need to consider special axioms or rules to guarantee the validity of, for example, $A \vee {\sim}A$ or ${\sim}{\sim}A \supset A$. Negation and disjunction rules in this system can be formulated as follows.

(Note the duality between these $\vee$-rules and the $\wedge$-rules formulated above, the right and left sides of the sequents being interchanged.) The *tertium non datur* (excluded middle) $\{\vdash A \vee {\sim}A\}$ is then obtained from $\{A\} \vdash \{A\}$ via $\vdash \{A, {\sim}A\}$. It is obvious that this notion of consequence has strong elements of symmetry which are characteristic of classical logic.

(4) Another approach is to restrict the structural principles underlying deductive systems. If in $X \vdash A$ we consider *X* no longer as a set but as a list of formulas, we may discuss whether in all cases we want to assume that elements of *X* are ‘permutable’ (that is, whether $Y, A, B, Z \vdash C \Rightarrow Y, B, A, Z \vdash C$ holds), or whether two identical formulas in *X* may be ‘contracted’ to a single one (that is, whether $Y, A, A, Z \vdash B \Rightarrow Y, A, Z \vdash B$ holds), or whether we want to assume or reject the principle of thinning (see above).

Such considerations, which apply analogously to the multiple-conclusion case, lead to so-called ‘substructural’ logics, which have become important in computer science and linguistics (but not only there); in particular, relevance logics (logics without thinning), contraction-free logics (in which the multiplicity of formulas counts), linear logics (without thinning and contraction) and Lambek logics without thinning, contraction and permutation). If at the level of general consequence relations we consider logics without monotonicity, we enter the general field of non-monotonic logics, which is of special interest in artificial intelligence, since it helps to

frame many common forms of reasoning (see Non-monotonic logic).

(5) In proof theory (see Proof theory) one is often interested in the structure of the derivation that leads from a set of assumptions *X* to a conclusion *A* and in criteria for when two proofs of the same 'derivability fact' $X \vdash A$ are to be seen as identical - rather than in whether $X \vdash A$ holds or not. Significant cases are calculi of natural deduction (see Natural deduction, tableau and sequent systems). With respect to derivability, they can be described as Gentzen sequent systems in the sense above. However, crucial features of the fine structure of derivations, such as the fact that different occurrences of the same formula as an assumption may be treated differently, cannot be captured in that way.

One should be aware that in cases (3)-(5), as well as in other cases, in which extensions or modifications of the usual concept of a deductive system are considered with respect to some 'object logic', the system in which this object logic is described has itself the structure of a deductive system in the ordinary sense. Sequent calculi for a multiple-conclusion consequence relation '$\vdash$', perhaps with substructural features, are themselves rule-based systems. Even the structure of natural deduction proofs can be characterized by a rule-based system, namely a system of type assignment for λ-terms. Therefore, it is not so much the specific type of consequence relation studied which makes logical systems formal systems, but rather the fact that the variety of logical systems can be described in terms of formal systems in the very specific sense of a rule-based system.

Formalism in art

Formalism in art is the doctrine that the artistic value of a work of art is determined solely by the work's form. The concept of artistic form is multiply ambiguous, however, and the precise meaning of formalism depends upon which sense of form it operates with. There are two main possibilities. The first understands form as the structure of a work's elements, the second as the manner in which it renders its 'content'. If form is understood as structure, formalism is still ambiguous: understood one way, it has never been denied; understood another way, it is untenable. If form is understood as manner, formalism is false.

1 Formalism and artistic value

Formalism as an artistic doctrine is a claim about the value of a work of art *as* a work of art. Let us call this 'artistic value' (see Art, value of §2). Formalism is the thesis that the artistic value of a work of literature, music, architecture or any other art is determined by the work's form, and by nothing else. This thesis presupposes that any work of art has two or more aspects, a formal aspect and one or a number of non-formal aspects, and implies that artistic appreciation should be focused exclusively on the form of the work. Note that it does not follow from the thought that a work's artistic value is determined solely by its form that all other aspects of the work are irrelevant to its value. For some or all of these other aspects may determine or contribute to form. If so, formalism does not require the aesthetic spectator to ignore them; rather, it requires the spectator to attend to them only in so far as it is necessary to perceive the work's form - only for this reason, and not for their own sakes.

But what is the form of a work of art? Is there a unitary notion of form, or does the idea of form change from art to art, or even from genre to genre?

2 Form as structure

'Form' often signifies the way in which the elements of an object are related to one another, that is to say, the structure of the elements. If 'form' is understood in this sense, formalism maintains the aesthetic irrelevance of the nature of the elements of a work of art, locating a work's value only in how it structures these elements: it does not matter what the elements of a work are, except in so far as only those elements, or elements of a similar kind, can be combined in the precise structure of the work. This version of formalism requires that a work of art is a composition of elements. But what are supposed to be the elements that compose works of art in the various art forms? The most obvious candidates for the elements of poems and musical works are, respectively, the words, and the notes, chords and rests that compose them. But it is not so clear what the elements of a play, a dance, a picture or a building might be supposed to be.

Let us shelve this difficulty, however, and concentrate on poetry and music. Given that a poem is a composition of words, and a piece of music a composition of notes, chords and rests, the crucial question is whether a work's form is separable from its elements. If a work's form is *its elements as concatenated in the work*, its form is not separable from its elements. Understood in this way, it is undeniable that a work's artistic value is determined not by its elements considered in themselves, but by its elements as related to one another in the work, that is, by its form. This variety of formalism is harmless. If, on the other hand, the form of a work of art can be shared with another work which has different elements, it is uncertain what the form of a work is, and there is no plausible candidate that would make formalism acceptable. To see this, consider what the form common to two poems or two symphonies might be. Whatever answer you give, it should be clear that the artistic value of a poem or symphony is not determined solely by its form.

3 Form as manner

The idea of artistic form as a structure of elements is not, however, the sole or even principal conception of form at work in the doctrine of formalism. Usually formalists allege the aesthetic irrelevance of one particular aspect of a work of art, which aspect changes from art form to art form. In architecture, form is principally opposed to function; in music, to the expression of emotion and other affective states; in the pictorial arts, to pictorial content (what is depicted); in poetry, to meaning or what is said. Accordingly, formalism in architecture maintains the artistic irrelevance of a building's function, except in so far as it contributes to the building's form; in music, of the expressive aspects of a work; in the pictorial arts, of what a picture depicts; in poetry, of what is said, as opposed

to how it is said. So it is the manner in which a function is realized, a subject depicted, an emotion or thought expressed - not the function, subject, emotion or thought - that determines the value of a work. Or so formalists claim.

What might lead one to embrace formalism? Let us call the non-formal aspect of a work of art that formalism dismisses F. A train of thought that often underlies formalism is this. A fine work of art can lack F. A poor one can possess F. Therefore, the value of a work of art that possesses F cannot be in any way due to its possessing F. For example: there are good paintings that do not depict significant subjects; there are poor paintings that do; hence, the significance of a painting's subject is irrelevant to its artistic value. Again: there are fine buildings that are not churches; there are poor buildings that are; hence, a building's being a church is irrelevant to its value as a work of art. But this line of thought is fallacious, as can be most easily seen by considering a parallel argument: there are good soccer players who lack a powerful kick; there are poor soccer players who do not; hence, the possession of a powerful kick is irrelevant to being a good soccer player. On the contrary, someone who possesses a powerful kick might be a good player partly because of that ability - it might be one of his strengths. The formalist argument mistakenly concludes from the fact that a certain feature - which it usually calls 'content' - is neither necessary nor sufficient for artistic value, that it is irrelevant to artistic value.

Formalists are motivated by a concern to preserve the autonomy of artistic value, but mistakenly believe that the only way to achieve this is by insulating artistic value from any aspect of a work - function, subject, emotion, thought - that has an extra-aesthetic reference. It is true that any aspect of a work of art contributes to the work's artistic value only as it is realized in the work. For example, the depicted content of a picture does not itself determine the picture's artistic value, which can easily be seen from the fact that two pictures can depict the same state of affairs but have unequal artistic values. But it does not follow from this that it is only how a picture depicts its content, not what that content is, that is relevant to its value as a picture. The consideration licences no stronger claim than that it is a picture's content *as depicted* that determines its value as art. Likewise, the fact that two buildings of unequal value can have the same function, two musical passages express the same emotion or mood, or two poems say the same thing shows no more than that a work's artistic value is determined not by its non-formal aspect, considered in itself, but only as realized in the building's structure, as expressed in the music's notes or in the arrangement of words that constitutes the poem. The truth of the matter is that the value of Pope's poetry is inseparable from the quality of the thought it expresses; the value of Poussin's *Echo and Narcissus* is inseparable from its being a depiction of that mythological story; and so on.

Foucault, Michel (1926-84)

Michel Foucault was a French philosopher and historian of thought. Although his earliest writings developed within the frameworks of Marxism and existential phenomenology, he soon moved beyond these influences and developed his own distinctive approaches. There is no overall methodological or theoretical unity to Foucault's thought, but his writings do fall into several main groups, each characterized by distinctive problems and methods. In his early studies of psychiatry, clinical medicine and the social sciences, Foucault developed an 'archaeology of knowledge' that treated systems of thought as 'discursive formations' independent of the beliefs and intentions of individuals. Foucault's archaeology displaced the human subject from the central role it played in the humanism which had been dominant since Kant. While archaeology provided no account of transitions from one system to another, Foucault later introduced a 'genealogical' approach, which seeks to explain changes in systems of discourse by connecting them to changes in the non-discursive practices of social power structures. Like Nietzsche's, Foucault's genealogies refused all comprehensive explanatory schemes, such as those of Marx or Freud. Instead he viewed systems of thought as contingent products of many small, unrelated causes. Foucault's genealogical studies also emphasize the essential connection between knowledge and power. Bodies of knowledge are not autonomous intellectual structures that happen to be employed as Baconian instruments of power. Rather, they are essentially tied to systems of social control. Foucault first used his genealogical approach to study the relations between modern prisons and the psychological and sociological knowledge on which they are based. He next proposed a similar analysis of modern practices and 'sciences' of sexuality, but eventually decided that such a study had to begin with an understanding of ancient Greek and Roman conceptions of the ethical self. This study was published in two volumes that appeared just before his death.

1 Biography

Foucault was born on 15 June 1926 in Poitiers, where his father was a prominent physician. In 1946, after preparatory studies with Jean Hyppolite at the Lycée Henri IV, he entered the École Normale Supérieure. He completed advanced degrees in both philosophy and psychology, working with, among others, Maurice Merleau-Ponty (see Merleau-Ponty, M. §2). Dissatisfied with French culture and society, Foucault held various academic posts in Sweden, Poland and Germany from 1955 to 1960, while he also completed his thesis (on madness in the Classical Age) for the *doctorat ès lettres*, which he published in 1961. During the 1960s, Foucault held a series of positions in French universities, culminating in 1969 with his election to the Collège de France, where he was Professor of the History of Systems of Thought until he died. Throughout the 1970s and until his death, Foucault was active politically, helping to found the Groupe d'Information sur les Prisions and supporting protests on behalf of homosexuals and other marginalized groups. He also frequently lectured outside France, particularly in the USA, and in 1983 had agreed to teach annually at the University of California at Berkeley. One of the first victims of AIDS, Foucault died in Paris on 25 June 1984.

Contrary to common views of authorship as self-expression, Foucault said that he wrote to escape from himself, to become other than he was. Correspondingly, there is no methodological or theoretical unity of Foucault's thought that will support any single comprehensive interpretation. His writings instead fall into several main groups, each characterized by a distinctive problematic and method of approach. It is fruitful to follow certain themes through some or all of these groups, but the core of his effort at any point is defined by what is specific to the problems then engaging him.

2 The history of madness

Foucault's earliest publications dealt with psychology and mental illness. His initial approach, developed in a long introduction to the French translation of Ludwig Binswanger's *Traum und Existenz* (1954), was through existential phenomenology, particularly that of the early Heidegger. His 1954 book, *Maladie mentale et personnalité (Mental Illness and Psychology)*, combined this approach with a Marxist analysis (which, however, Foucault soon decisively rejected). His first major work, *Folie et déraison: histoire de la folie à l'âge classique (Madness and Civilization)* (1961), tried to combine the experiential emphasis of his earlier phenomenological discussions with an essentially historical approach.

Folie et déraison is a challenge to the modern use of the terms 'mad' and 'mentally ill' as synonyms. Beginning in

the early nineteenth century, doctors and other therapists rejected such traditional conceptions of madness as divine ecstasy or diabolical possession in favour of the 'enlightened' view that madness is mental illness. Standard histories of psychiatry canonize this view, telling the story of how brave and compassionate men such as Tuke and Pinel replaced superstitious cruelty with scientific treatment of the mad. Foucault's rejection of this view is based on a detailed analysis of the 'experience' of madness that prevailed in the Classical Age (roughly, 1650 to 1800). Then, he maintains, madness was regarded not as mental illness but as a fundamental choice in favour of unreason (*déraison*), where unreason is any basic rejection of the norms of rationality constituting the boundaries of bourgeois social life. Among the various forms of unreason (including sexual promiscuity and deviancy, irreligion and idleness) madness was distinguished by its embracing the animal aspect of human nature at the expense of all higher aspects. The mad were those who had stripped themselves of everything distinctive of their humanity and had chosen to live like beasts. Since, on the classical view, madness was defined by its rejection of reason, the only rational reaction to it was rejection and exclusion. (Foucault regards Descartes' dismissal of his possible madness as grounds for doubt as a paradigm of this point.) Since the Classical Age had no coherent way of giving the mad a place in society, the only alternative was to exclude them from rational society, an exclusion epitomized by the Great Confinement of 1656.

The implication of Foucault's analysis is that there was, even in the relatively recent past of our own culture, a view of madness which was radically different from our own and no less defensible. This alone, he suggests, should begin to undermine our idea that there is something inevitable about our conception of madness. Foucault drives home his point through an analysis of the development of the modern (post-French-Revolution) 'experience' of madness as mental illness. This experience restores a social locus to madness, seeing it as a deviation from norms (an illness), not a rejection of the entire framework of rationality that defines these norms. He takes particular pains to show that, in spite of its veneer of scientific objectivity, the modern view is based more on a moral disapproval of the values implicit in madness than on any objective scientific truth. Similarly, he argues that the modern treatment of the mad (in asylums) was not so much a matter of medical compassion as a concerted effort to bring the mad back beneath the yoke of bourgeois morality. Initiating a theme further developed in various literary essays during the 1960s, *Folie et déraison* continually evokes the lives and works of artists haunted by madness (Van Gogh, Roussel, Artaud, Nietzsche) as precious expressions of a truth suppressed by both classical and modern experiences of madness.

3 The archaeological method

The second major division of Foucault's work begins with his history of the origins of modern medicine, *Naissance de la clinique: une archéologie du régard médical (The Birth of the Clinic)* (1963). Its first pages suggest that it is an extension of Foucault's ethical critique of the concept of mental illness to that of physical illness. But very soon the study becomes an analysis of the linguistic and conceptual structures underlying the modern practice of medicine; or, in the phrase of its subtitle, 'an archaeology of medical perception'.

Foucault's development of his 'archaeological method' synthesized three fundamental lines of influence on his thought: the history and philosophy of science of Gaston Bachelard and Georges Canguilhem (see Bachelard, G. §2; French philosophy of science §§1-6); the modernist literature of (especially) Raymond Roussel, George Bataille and Maurice Blanchot; and the historiography of Fernand Braudel and his *Annales* School. The point of convergence of these influences was the elimination of the subject as the centre of historical and philosophical analysis. Bachelard and Canguilhem challenged what Foucault called the 'transcendental narcissism' of existential phenomenology through a philosophy of objective concepts opposed to the existentialists' philosophy of subjective experience. Bachelard worked primarily on the physical sciences and Canguilhem on the biological and medical sciences, but Foucault extended their viewpoint to the strongholds of the modern conception of subjectivity: the 'human sciences'. Modernist writing excited Foucault by its potential for, in Bataille's terminology, 'transgressing' the limits of standard knowledge and experience. As illustrated in his essay, 'What Is an Author?' (1969a), Foucault was particularly impressed with the modernists' decentring of the author and their constitution of language itself as the essence of literature. Braudel and his school had obtained extremely interesting results by varying the historiographical perspective; that is, by writing history not in terms of individuals' experience but from the broader standpoint of long-term factors such as geography, climate and natural resources. Foucault's archaeology did not take over any of Braudel's specific results or methods but tried to effect a parallel change of perspective in the history of thought: a move away from the individual thinker and

towards more fundamental categories and structures.

Foucault’s fullest deployment of his archaeological method was in *Les mots et les choses: une archéologie des sciences humaines (The Order of Things)* (1966), where he analysed the linguistic systems (‘epistemes’) characteristic of certain periods of thought. In particular, Foucault delineated the linguistic systems underlying the classical disciplines of general grammar, natural history and analysis of wealth, as well as those of the modern disciplines of philosophy, biology and economics that replaced them. He argued that there were strong structural similarities among the three classical disciplines and among the three modern disciplines, but a sharp break between classical and modern modes of thought taken as wholes. On this basis he rejected, for example, the common view that the work of nineteenth-century biologists such as Darwin was a continuous development of the work of eighteenth-century natural historians such as Lamarck. Specifically, he maintained that there is no hint of the Darwinian concept of evolution in Lamarck or any other classical thinker. He took such results as illustrative of the superiority of his archaeological approach to standard history of ideas, which focused on the specific concepts and theories of particular thinkers and not on the linguistic structures underlying them.

L’archéologie du savoir (The Archaeology of Knowledge) (1969b) systematically articulated the methodology Foucault had gradually forged in his preceding historical studies. It did this through an account of discourse, based on his notion of the statement (*l’énoncé*), which described a level of linguistic structure prior to and determining the range of objects, concepts, methodological resources and theoretical formulations available to individuals who speak and write. This account provided a theoretical elucidation of the decentring of the subject effected by Foucault’s histories.

4 Genealogy

Foucault’s writings during the 1970s constitute a third major division of his work. Although archaeological method is not abandoned in this period, it is subordinated to a new style of analysis that Foucault, with a bow to Nietzsche, dubs ‘genealogical’. A genealogical analysis explains changes in systems of discourse by connecting them to changes in the non-discursive practices of social power structures. Foucault recognizes the standard economic, social and political causes of such changes, but he rejects the efforts of many historians to fit these causes into unitary, teleological schemata, such as the rise of the bourgeoisie or Napoleonic ambition. Rather, he sees changes in non-discursive practices as due to a vast number of minute and unconnected facts, the sorts of ‘petty causes’ that Nietzsche evoked in his genealogies (see Genealogy).

Foucault’s genealogical studies emphasize the essential connection between knowledge and power. Bodies of knowledge are not autonomous intellectual structures that happen to be employed as instruments of power. Rather, precisely as bodies of knowledge, they are tied (but not reducible) to systems of social control. This essential connection of power and knowledge reflects Foucault’s view that power is not merely repressive but a creative, if always dangerous, source of positive values. Although systems of knowledge may express objective truth in their own right, they are none the less always tied to current regimes of power. Conversely, regimes of power necessarily give rise to bodies of knowledge about the objects they control; but this knowledge may - in its objectivity - go beyond and even ultimately threaten the project of domination from which it arises.

Surveiller et punir: naissance de la prison (Discipline and Punish) (1975) is the best example of Foucault’s genealogical approach. Here Foucault applies his conception of knowledge/power to the connection between modern disciplinary practices and modern social scientific disciplines. His primary example is the relation of the practice of imprisonment to such disciplines as criminology and social psychology. But imprisonment quickly becomes a model for the entire range of modern disciplinary practices, as employed in schools, factories, the military and so on. *Discipline and Punish* is a genealogical study in the precise sense that it shows how fundamental changes in thought (the emergence of new social scientific disciplines) were causally connected with changes in non-discursive practices (characteristically modern means of controlling the body).

Foucault’s *Histoire de la sexualité (History of Sexuality)* (1976-84) was initially conceived as a straightforward extension of the genealogical approach to sexuality. His idea was that modern bodies of knowledge about sexuality (the ‘sciences of sexuality’, including psychoanalysis) have an intimate association with the power structures of modern society. Volume 1, published in 1976, was intended as the introduction to a series of studies on particular aspects of modern sexuality (children, women, perverts and population), outlining the basic viewpoint and

methods of the project. A central contention was that the history of sexuality is distorted by our acceptance of the ‘repressive hypothesis’: the proposition that the primary attitude towards sex during the last three centuries was one of opposition, silencing and, as far as possible, elimination. Foucault argues that in fact this period produced a ‘discursive explosion’ regarding sex, beginning with the rules of the Counter-Reformation governing sacramental confession. These rules emphasized the need for penitents to examine themselves and articulate not just all their sinful sexual actions, but all the thoughts, desires and inclinations behind these actions. The distinctive modern turn is the secularization (in, for example, psychoanalysis) of this concern for knowing and expressing the truth about sex.

Foucault emphasizes the similarities in our views of sex and crime. Both are objects of allegedly scientific disciplines, which simultaneously offer knowledge and domination of their objects. In the case of sexuality, however, control is exercised not only through others’ knowledge of individuals but also through individuals’ knowledge of themselves. We internalize the norms laid down by the sciences of sexuality and monitor our own conformity to these norms. We are controlled not only as *objects* of disciplines but also as self-scrutinizing and self-forming *subjects*. Foucault thus sees our apparently liberating focus on our sexuality as just a reinforcement of the mechanisms of social control. The self-scrutiny that overcomes psychic repression to reveal our deep sexual nature is merely a subtle means of shaping us to the norms of modern society.

5 Sexuality and ethics

Foucault planned the second volume of his history of sexuality as a study of the origins of the modern notion of the subject in the practices of Christian confession. He wrote such a study, ‘Les aveux de la chair’ (The Confessions of the Flesh), but did not publish it because he decided that a proper understanding of the Christian development required a comparison with ancient conceptions of the ethical self. This led to two volumes on Greek and Roman sexuality: *L’usage des plaisirs (The Use of Pleasure)* (1984a) and *Le souci de soi (The Care of the Self)* (1984b). These two volumes mark the fourth and final period of Foucault’s work, a period most striking for its emphasis on the individual self: the ‘problematization’ of its world and actions and the ‘aesthetics of existence’ whereby it makes its life a work of art. It might seem that Foucault has finally rejected the derivative and ephemeral status of the individual. But this would be doubly mistaken. On the one hand, he still sees our history as strongly structured by discursive and non-discursive practices operating at much deeper levels than that of human consciousness. On the other hand, every stage of Foucault’s work was directed towards overcoming the limitations of individuals (himself and others). Previously, his effort was the negative one of dissolving the apparently necessary constraints of society and its discourses. In this final turn to what he calls ‘ethics’, he began to explore the positive possibilities of self-creation.

In *The Use of Pleasure* and *The Care of the Self*, Foucault compares ancient pagan and Christian ethics through studies of the test case of sexuality. He notes that the moral codes of pagans and Christians were similar, but maintains that there were fundamental differences in the ways in which individuals were subordinated to the codes (in the ‘forms of subjectification’). The Greeks of the fourth and fifth centuries BC, unlike the early Christians, did not regard the domain of sexual acts (*ta aphrodisia*) as evil in its own right, but as natural and necessary. The Greeks did see sexual acts as objects of moral concern because of their animality and their great intensity. What was dangerous, however, was not sex in itself but its excesses. Therefore, the Greek mode of subjection to the code of sexual ethics was a matter of the proper use (*chresis*) of pleasures. Unlike the Christians, the Greeks allowed the full range of sexual activities (heterosexual, homosexual, in marriage, out of marriage) with proper moderation. Properly used, sex was a major part of an aesthetics of the self: the self’s creation of a beautiful and enjoyable existence.

The Use of Pleasure analyses a variety of primary texts (for instance, those of Plato and Xenophon) in order to understand the classical Greek conception of an aesthetics of existence. *The Care of the Self* continues with studies (of Galen, Artemidorus and Plutarch, for example) showing how later antiquity gradually moved away from this aesthetics towards a hermeneutics of the self. The latter, fully developed only by Christianity, replaced the ideal of aesthetic self-creation with that of a deep understanding of a hidden ‘real self’. Foucault regards this Christian conception as the root of our domination by the sciences of sexuality he discussed in *The History of Sexuality I*. Although insisting that there can be no question of ‘going back to the Greeks’, he suggests that reflection on the aesthetics of existence may help us devise liberating alternatives to the traps of modern sexuality (see Sexuality,

philosophy of §3).

6 Conclusion

It is impossible to understand Foucault's work in the typical manner of histories of philosophy. There is not only no system, but no sustained vision, message or project (which we find even in such mavericks as Nietzsche, Kierkegaard and Wittgenstein). For Foucault, philosophy is always just a means of overcoming some specific set of historical limits. It has no final goal, no specific truth or effect, of its own. It is merely a set of intellectual techniques, tied to a consciousness of the historical enterprise that has been known as philosophy. If philosophy ever transforms its self-conception along the lines of Foucault's practice, then he will be recognized as a great philosopher (or, more likely, as someone who played a major role in eliminating philosophy as it had been understood since Plato). Otherwise, he will in all likelihood remain a minor figure, interesting for his odd historical perspectives and his quirky social criticism.

GARY GUTTING

List of works

Foucault, M. (1954) *Maladie mentale et personnalité*, Paris: Presses Universitaires de France; revised as *Maladie mentale et psychologie*, Paris: Presses Universitaires de France, 1962; trans. A. Sheridan, *Mental Illness and Psychology*, Berkeley, CA: University of California Press, 1987.(Foucault's first book, showing the strong influence of existentialist phenomenology and of Marxism. The 1962 revision (the version used in the translation) eliminates most of the Marxist discussions and develops a view much closer to that of *Folie et déraison*.)

Foucault, M. (1961) *Folie et déraison: Histoire de la folie à l'âge classique*, Paris: Plon; 2nd edn, with new preface and appendices, *Histoire de la folie à l'âge classique*, Paris: Gallimard, 1972; trans. R. Howard, *Madness and Civilization*, New York: Pantheon, 1965.(A critical history of the origins of modern psychiatry. The English translation is greatly abridged, amounting to less than half of the original.)

Foucault, M. (1963) *Naissance de la clinique: une archéologie du régard médical*, Paris: Presses Universitaires de France; trans. A. Sheridan, *The Birth of the Clinic*, New York: Vintage, 1973.(An analysis of the linguistic and conceptual structures underlying the modern practice of medicine.)

Foucault, M. (1966) *Les mots et les choses: une archéologie des sciences humaines*, Paris: Gallimard; trans. A. Sheridan, *The Order of Things*, New York: Random House, 1970. (A critical history of the origins of the modern social sciences.)

Foucher, Simon (1644-96)

Simon Foucher, Canon of Dijon, was a sceptical thinker, active in intellectual circles in Paris. His main philosophical project was the revival of Academic scepticism, and he emerged as an important and influential critic of Cartesian philosophy, questioning the consistency of the Cartesians' commitment both to mind-body dualism and to the claims that ideas in the mind represent and make known external bodies, and that mind and body interact. He was generally concerned to undermine the Cartesian pretension to know the real essences of mind and body. Foucher was also an early constructive critic of Leibniz's system of pre-established harmony.

1 Life and works

Foucher was born on 1 March 1644, in Dijon, France. He was ordained to the Roman Catholic priesthood while still quite young, and made an honorary canon of the Sainte Chapel of Dijon. Although he received a bachelor's degree in theology from the Sorbonne, and earned a small salary as the chaplain of a religious house in Paris, his real interests were philosophical. He spent the rest of his life in Paris, and quickly became known as a formidable critic of Cartesian philosophy. His first serious contacts with Cartesianism probably came in 1667-8 through the weekly lectures on physics given by Jacques Rohault. (There is an apocryphal story that Rohault asked Foucher to deliver a funeral oration when Descartes' remains were returned to Paris for burial in 1667). It was probably Rohault's lectures (and subsequent arguments between the two) that stimulated Foucher's interest in experimental physics, and in 1672 he published a letter describing various instruments for measuring air humidity. By that time, he had also developed a passion for Academic scepticism, not just as a means for criticizing what he perceived as Cartesian dogmatism, but also as a useful and important propaedeutic for Christian belief. In 1673, he published the first of three dissertations on the Academic philosophy, *Dissertation sur la recherche de la vérité, ou sur la logique des academiciens*. It was Foucher's belief that Nicolas Malebranche's *De la recherche de la vérité*, was a response to this work that led him to compose his *Critique de La recherche de la vérité* (1675), in which he criticizes Malebranche in particular and Cartesian metaphysics and epistemology generally. This was only the opening salvo in what would be an extended (and acrimonious) public polemic between Foucher and the Cartesians, especially Malebranche and Dom Robert Desgabets (who rallied to Malebranche's defence). Foucher also found himself engaged in a fruitful, twenty-year philosophical correspondence with Leibniz (whom he had met when Leibniz resided in Paris from 1672 to 1676). Foucher's early critical remarks on Leibniz's metaphysics forced Leibniz to clarify and develop his views, which Foucher helped get published. Foucher died (some said of overwork) on 27 April 1696.

2 Academic scepticism

In his assault on the Cartesian system, Foucher employed the weapons of classical scepticism. He looked, in particular, to the thinkers of the New Academy, such as Antilochus and Philo, although he also saw Academic scepticism as a perfectly Augustinian tool that promotes Christian faith (see Academy; Platonism, Early and Middle). Foucher's scepticism was of the moderate variety. He sought to steer a middle course between dogmatism and extreme Pyrrhonism (see Pyrrhonism). While there are, to be sure, many things that cannot be known, there are also some that can be known with certainty. The sincere sceptic does not doubt all things. Rather, the goal of the Academic sceptic is precisely to distinguish that which can be known from that which cannot. Philosophy just is the search for those *veritez evidentes* and *connoissances certaines* that lead to new knowledge.

According to Foucher, the criterion of truth is absolutely certain evidence, complete indubitability, particularly as detected by application of the law of non-contradiction. One should thus admit as true and as known only that which is evidently true, or that which cannot be denied without contradiction. On this criterion, it turns out that the most evident truths are mathematical and conceptual, along with introspective claims concerning states of mind. This class of self-evident truths gives us our first principles, from which we can then seek out further knowledge, particularly concerning the soul, God and the existence of the world. As long as we start from incontestable first principles and draw from them only necessary consequences, we will not be led into error and falsehood. Foucher thus sums up the Academic method in five simple principles: (1) in the matter of science, proceed only by demonstration; (2) do not concern oneself with problems that clearly cannot be resolved; (3) admit that one does not know those things that one effectively does not know; (4) distinguish those things that can be known from

those that cannot be known; and (5) always seek new knowledge.

While the evidence of introspection does provide knowledge of our internal states - states of the soul, such as pleasure, pain, heat and cold sensations, and other sensible qualities as sensed - and we can infer the *existence* of external bodies in the world from the testimony of sensation, we cannot have real knowledge of the natures or essences of external things, how they are 'in themselves'. The senses, he insists, can tell us nothing about the truth of things; they provide only phenomenal appearances, and we can never know whether those appearances represent to us things are they really are. Immediately-known appearances are only 'ways of being' (*façons d'être*) or 'modifications' of the soul, which we can never compare with the things themselves, to which we have no direct access. Similar considerations apply to our knowledge of the soul. We can be certain that the soul exists, and we have immediate knowledge of the modifications or properties of the soul - that it is a thinking thing - but we cannot have certain knowledge of what the soul is in its being or nature.

In the case of the particular sciences, which are based on sense experience, Foucher insists that one can attain many probabilities, as long as one follows proper (that is, academic) method. Speculation about the causes of our sensations can lead to a kind of knowledge about the world, and will even produce many useful and practical results. But one should be properly modest (and not dogmatic) about the status of the results thereby obtained.

3 Critique of Cartesianism

Academic scepticism gave Foucher the means to criticize the Cartesians. When Descartes and his followers claim to know the essence of matter and the essence of mind, and to know therefore that these are two substances that are radically different in nature, they go beyond what is evident and certain. While Foucher, in his dissertations on *les Academiciens*, contrasts in a general way the Academic philosophy with the Cartesian philosophy, the particular occasion for him to compose a detailed critical investigation into the principles of Cartesianism was the publication in 1674 of the first volume (the first three books) of Malebranche's *Recherche*. Foucher took this to be a complete work in its own right, and this led him to misunderstand some important features of Malebranche's system. (Malebranche himself testily replied that 'when one criticizes a book, it seems one ought at least to have read it'). But although Foucher may occasionally miss the mark with respect to Malebranche, he none the less scores some important points, later to prove influential, against a more orthodox version of the Cartesian system. Foucher, in fact, takes himself to be examining not just Malebranche's work, but at the same time *une partie des principes de M. Descartes*.

Foucher composed his *Critique* in 1674, and it was published in early 1675. His real object of attack, in this and subsequent critical works, is the confidence of Cartesians that they know the essences of mind (thought) and matter (extension). Two themes running throughout the *Critique* are, first, that these are matters for investigation, and are not to be assumed at the outset of one's inquiries; and, second, for all we know there may be something material about the mind. Perhaps, for example, our mental operations consist in certain brain activities. Moreover, if mind-body dualism is true, Foucher argues, then there are some serious internal and sceptical problems facing Cartesian epistemology and metaphysics.

Cartesians say (and Foucher agrees) that what the mind always immediately perceives is a representative idea: external bodies are perceived only by means of ideas. But then Cartesians also want to draw a distinction between quantitative ideas (of extension and motion) that truly represent features of external bodies and qualitative sensory ideas (colours, light, heat and so on) which do not. Foucher claims that they are not entitled to this distinction. For the Cartesian, he insists, *all* ideas are only modes of being of the soul and all are caused in the mind by bodies in the same way (here he misreads Malebranche, for whom ideas properly speaking are not modes of the soul but are in God (see Malebranche, N. §§2-3). On what grounds, therefore, can one say that some mental modes represent features of external bodies and others do not? Either both kinds of ideas represent, or neither does.

In the course of his arguments in the *Critique* and other works (in effect, arguments against the difference in epistemological value granted by philosophers to 'primary quality ideas' and 'secondary quality ideas'), Foucher introduced considerations that would prove to be influential in the history of sceptical objections to the so-called 'way of ideas'. Cartesians say that we know colours, light and other such qualities through the senses; that is, that they just are sensations and properties of the mind. But if this is an argument that there is nothing like colour in external bodies, it follows that it is equally an argument that there is nothing like extension in bodies, since we also

know extension through the senses. Thus, extension and figure would have to be no less 'in us' than are light and colours and heat. Moreover, if one grants that sensory qualities such as colour are in us, then it is difficult not to admit that the mathematical qualities are in us as well. First, the sceptical arguments that appeal to variations in sensory appearances to show that such qualities as heat and cold are in us and not in bodies can be used to demonstrate the same thing about all the other qualities, such as shape and size. Second, how could one claim that colours are in us without also recognizing that extension must be in us as well, since the extension of a colour, its shape, is obviously and undeniably where the colour is? Thus, once again, either both kinds of ideas represent, or neither does.

Foucher, however, raises an even deeper question for the Cartesian theory of ideas. How can *any* mental being such as an idea represent and thus make known something material? Since, as the Cartesians insist, 'the soul has nothing at all in it that is like matter and extended beings', a mode of the soul cannot be like a material body. And if there is no likeness between an idea and a body, then an idea cannot represent a body. *None* of our ideas, for the Cartesian, should be capable of giving us knowledge of objects outside us. To save their system, Foucher believes, Cartesians deny that representation requires resemblance; words, for example, represent objects without resembling them. Foucher replies that the notion of non-resembling representative ideas is incomprehensible. On that assumption, any idea could arbitrarily represent any object and all of our ideas could represent one and the same object. Furthermore, representation (at least in its primary signification) essentially involves resemblance. Words can represent objects they do not resemble only because they excite in the mind ideas that do represent things in a primary (that is, a resembling) manner. Foucher's conclusion is that since representation requires resemblance, to posit representational ideas in the mind is to admit that mind and matter cannot be as different as the Cartesians say they are. Either our ideas do not represent material things at all, or they do so because they are like those material things - in which case the Cartesians do not really know the essences of mind and matter.

The same general sceptical conclusion is drawn from a consideration of the question of mind-body interaction. Foucher claims that Cartesians are committed to a causal principle according to which there must be an essential or substantial likeness between a cause and its effect. But for Cartesians there is no respect whatsoever in which mind and body are alike. So they must, by their own principles, deny that mind and body causally interact. But, Foucher continues, mind and body obviously *do* interact; and the causal principle is self-evident. It follows that Cartesians cannot really know the essences of mind and matter.

4 Correspondence with Leibniz

In 1676, Foucher began a correspondence with Leibniz that lasted until the end of his life. Its interest lies both in Leibniz's own comments on his constantly developing metaphysics and in Foucher's insightful constructive criticisms. The extracts published in the *Journal des sçavans* between 1692 and 1696 constitute Leibniz's first public presentation of the principles of his *nouveau système*. There is much common ground between the correspondents. They agree, for example, on the value of Academic scepticism for philosophical inquiry, although Leibniz is the more insistent that the philosopher should seek to establish metaphysical and physical truths by building up a system from first principles. What Foucher seems to find most attractive about Leibniz's system is the critique of Cartesianism and the alternative to a strict dualism which it offers. He agrees with Leibniz, for example, that the essence of matter does not consist in extension, as the Cartesians had asserted.

Part of Leibniz's project in the 1680s and 1690s was to explain 'the communication of substances and the union of mind and body' without postulating either real causal interaction between them, or the continuous, quasi-miraculous agency of God (as Malebranche and, perhaps, if more equivocally, Descartes had done). Every individual substance, Leibniz claimed, spontaneously generates (from an inner principle of action) its own sequence of states, and God has so set up things from the start that there is, in the unfolding of the states of things over time, a 'grand concommitance' (what Leibniz later called the 'pre-established harmony') (see Leibniz, G.W. §6).

Foucher grants that God could adjust things in such a way that the body could produce by itself all the movements that the soul joined to the body would produce, without giving to the soul any power to effect motion in the body; and, conversely, that the thoughts and modifications of the soul that correspond to these bodily motions could arise successively at the precise moments when the body undergoes its movements. But what, he asks, is gained by such a 'grand artifice'? As much as Malebranche's occasionalism, it has God go to a great deal of trouble to make it

seem as though substances causally interact when in truth they do not (see Occasionalism). God might as well dispense with material bodies altogether and simply produce thoughts and modifications in the mind directly. Bodies, on Leibniz's (and the occasionalist) view, are useless anyway, since the mind can neither move nor know them. What Foucher really wants, however, is an explanation of *how* mind and body do interact, and not the implausible claim that the appearance of interaction is misleading.

Foucher is surprised by Leibniz's account. It is clear to him that Cartesians are forced into their metaphysical contortions by their commitment to dualism: since mind and body are so unlike each other, real interaction is not possible; thus, the recourse to a *deus ex machina*. But Leibniz rejects the conception of two utterly different kinds of substance, and he puts active force in things. So what, Foucher wonders, prevents mind and body from really interacting? But perhaps, he suggests in fine sceptical manner, these are questions that we simply cannot yet resolve, at least not until all philosophers agree on the infallible criterion of truth.

5 Influence

Unlike Descartes, Malebranche and Leibniz, Foucher was not a system-builder. His philosophical talents were mainly critical and analytical in nature. Yet he is, for that reason, important and influential in the history of seventeenth and early eighteenth century philosophy, particularly through the epistemological criticisms he directed at the Cartesian theory of ideas. His sceptical arguments against the distinction between ideas which represent features of external bodies and sensations which do not, were picked up by such contemporary and later thinkers as Bayle (*Dictionnaire historique et critique*, article on Pyrrho, remark B; article on Zeno, remarks G and H), Berkeley (*Principles of Human Knowledge*, 8-15, and *Three Dialogues* I) and Hume (*A Treatise on Human Nature* I.4.ii).

Foundationalism

Some foundationalists are rationalists who rely on intuition and deduction. Others are empiricists, in a broad sense, and accept observation and induction or abduction or yet other ways to support beliefs by means of other beliefs. What they have in common is that they are all willing to hazard a positive view about what in general makes a belief epistemically justified in the way required for it to be a case of knowledge; and they all propose something of the following general form: belief b is justified if and only if either b is foundationally justified through a psychological process of direct apprehension p (such as rational intuition, observation, introspection, and so on) or else b is inferentially justified through a psychological process of reasoning r (such as deduction, induction, abduction, and so on) ultimately from beliefs all of which are acquired or sustained through p. If one rejects all forms of such foundationalism, then a question remains as to what distinguishes in general the cases where a belief is epistemically justified from the cases in which it is not. Can anything general and illuminating be said about what confers epistemic justification on a belief, and what gives a belief the epistemic status required for it to constitute knowledge (provided it is true)?

1 Formal foundationalism versus substantive foundationalism

The foundationalism controversy in the late twentieth century can be clarified by a distinction between ‘formal foundationalism’ and ‘substantive foundationalism’. Substantive foundationalism is opposed to coherentism; formal foundationalism is opposed not to coherentism but to what is here called (epistemic) ‘pessimism’.

Formal foundationalism may be held with respect to the study of normative or evaluative principles of any sort. For instance, it may be held in ethics as well as in epistemology. Formal foundationalism in ethics tries to fix the goodness of events or states, or the rightness of actions, perhaps recursively. Thus a simple utilitarian theory might say that:

(1) every event of someone undergoing pleasure is good,
(2) every event that causes a good event is good, and
(3) every event that is good is so in virtue of (1) or (2).

(This is of course absurdly simple but it will serve as an example of a foundationalist ethical theory.)

Analogously, formal foundationalism in epistemology would say that:

(1) every belief with a certain non-epistemic property *g* is justified,
(2) if a belief bears relation *r* to a set of justified beliefs then it is itself justified, and
(3) every belief that is justified is so in virtue of (1) or (2)

There are various familiar candidates for the role of property *g* or of relation *r*. Thus property *g* may be indubitability or infallibility of belief, and relation *r* may hold between a belief *b* and a set α of further beliefs when *b* is deductively based on α. But these are only some examples.

Is there an alternative to foundationalism thus understood? If there is a class of justified beliefs at all, must it be specifiable in some illuminating way, at least recursively, or can it just be the class of justified beliefs and that is that? There is no obvious reason to think that the class of blue things must be recursively specifiable in terms of a basis and a generator that are colour-neutral. Why should we think that the class of justified beliefs must be recursively specifiable in terms of a basis and a generator that are epistemically neutral?

The main reason in favour of formal foundationalism - antecedent to an actual, compelling foundationalist theory - is the apparently supervenient or consequential character of the evaluative generally and of epistemic justification in particular. For example, an apple may be a good apple in virtue of certain non-evaluative properties: in virtue, say, of being sweet, juicy, large and so on. If so, then its evaluative property of being a good apple ‘supervenes’ upon its complex of non-evaluative properties that include being sweet, juicy, large and so on. And this means that any sweet, juicy, large, apple would also be a good apple. This example introduces the concept of the ‘supervenient’ to be defined in what follows. According to the doctrine of supervenience, evaluative and normative properties always supervene upon or derive from non-evaluative, non-normative properties, in the way the

goodness of an apple might supervene upon or derive from its juiciness, sweetness and so on (see Supervenience).

An acceptable formal foundationalist theory would specify a particular non-epistemic basis and generator, which would give more precise content to the doctrine of supervenience or consequentialism, and would fulfil its promise. Such a formal foundationalism would assure us that for every case of a justified belief, its being justified is supervenient on a set of non-epistemic facts involving only the basis property of the recursion and its generating relation. (The very same defence can be given for foundationalism in ethics, where, of course, utilitarianism is only one example of such foundationalism.)

It should be noted that formal foundationalism does not entail a doctrine of objectively unique foundations for empirical knowledge. For there might be several alternative recursive specifications of the class of justified beliefs, making use of different bases and generators, without any evident criterion for selecting one as objectively correct. If so, there might be different bases determining different foundations, none objectively prior or superior to the others.

That being so, if (for the sake of example) we presuppose a definition of the justified using indubitability as the basis and deduction as the generator, we may then think of the set of indubitable beliefs as the foundation of empirical knowledge. If so, we will be right only relative to our definition. For if the foundation is what is picked out by the basis property, then the indubitable is the foundation only relative to the definition that uses indubitability as the basis property. And so long as other definitions, using other bases, are equally possible and on a par with ours, the relativity is ineliminable.

2 Epistemic supervenience and formal foundationalism

Pessimism is to be distinguished from the more radical position that simply rejects supervenience. The ‘doctrine of supervenience’ for an evaluative property *f* is simply that, for every *x*, if *x* has ϕ then there is a non-evaluative property (perhaps a relational property) ψ such that:

(1) *x* has ψ, and
(2) necessarily, whatever has ψ has ϕ.

The denial of this for an evaluative property ϕ is a doctrine of the *autonomy* of ϕ. It holds that ϕ can be exemplified even though it does not supervene on any non-evaluative properties of what exemplifies it.

Formal foundationalism entails the doctrine of supervenience for epistemic justification, but is also considerably stronger. It requires in addition a certain faith in our intellectual powers, or a certain confidence in the manageable simplicity of the sphere of the relevant values (that is, epistemic if the foundationalism is epistemic, ethical if it is ethical, aesthetic if it is aesthetic, and so on). After all, formal foundationalism requires not just supervenience but *explicable, comprehensible* supervenience: supervenience at least surveyable by the human mind.

Accordingly, since pessimism is the denial of formal foundationalism and *not* of the weaker doctrine of supervenience, pessimism is a weaker claim than the doctrine of autonomy. Pessimism is compatible with supervenience and requires only a certain scepticism about our ability to comprehend the principles that underlie such supervenience, perhaps because they are infinite in number or degree of complexity.

Far from being pessimist, the coherence theory in epistemology is a kind of formal foundationalism, for it does try to provide principles that specify the conditions within which beliefs are justified. Thus a coherentist might choose coherence within a set of a certain sort as basis and deduction as generator. For example, a coherentist may hold that a belief is justified if and only if *either* it coheres within a large and diverse set of beliefs held by the subject *or* it is deduced by the subject from a set of such beliefs. In fact the coherentist usually has an all-encompassing basis that absorbs all generators, but this is quite compatible with formal foundationalism, though it is a limiting case (see Knowledge and justification, coherence theory of).

Coherentism is opposed not to formal foundationalism but at most to substantive foundationalism. The conflict here is over what basis to choose in the recursive definition of justification. Obviously, there are grades of coherentism and of foundationalism. Radical coherentism holds that *only* coherence can serve as a basis. Radical foundationalism holds that coherence *never* serves as a basis, that the basis property which gives a belief *B* access to the foundation never makes reference to *other* beliefs of the subject, except of course such beliefs as *B* itself

may refer to. And various intermediate positions are clearly possible.

An infinite regress of justification is incompatible neither with formal foundationalism nor even with radical foundationalism. Consider the infinite sequence:

(P1) That there is at least one real number in the interval (0-1)
(P2) That there are at least two real numbers in the interval (0-1)
⋮

I can think of no compelling reason why there could not be a sequence of justified dispositional beliefs in (P1), (P2), … such that each member of the sequence is justified in the following sense (J1) by its successor: (J1) *p justifies (would justify) q if and only if that p is justified is sufficient for q to be justified*. This sense is not ruled out by formal foundationalism, nor does formal foundationalism rule out the possibility of a sequence of dispositional beliefs in (P1), (P2), …. What formal foundationalism would require of such a sequence, however, is that for each of its members there be a possible finite epistemic account or explanation of how its justification supervenes on the non-epistemic (such an explanation to be carried out perhaps by means of a non-epistemic basis *g* and a non-epistemic generator *r*).

It seems, therefore, that foundationalists misplace their objection when they focus on the infinite regress of justification. What they really oppose is pessimism. Their fundamental thesis is formal foundationalism, which we have found to be a form of the doctrine of supervenience.

G.E. Moore was optimistic enough about the possibility of a normative ethics (that is, of an ethical theory or system) to write as follows in *Principia Ethica*:

> When *A* asks *B* what school he ought to send his son to, *B*'s answer will certainly be an ethical judgment. And similarly all distribution of praise or blame to any personage or thing that has existed, now exists, or will exist, does give some answer to the question 'What is good?'…. But this is not the sense in which a scientific Ethics asks the question. Not one, of all the many million answers of this kind, which must be true, can form a part of an ethical system; although *that science must contain reason and principles sufficient for deciding on the truth of all of them*.
>
> (Moore 1903: 3; emphasis added)

For Moore, a scientific ethics must have a kind of completeness which, given that it is comprehensible, it can have only if pessimism is false and formal foundationalism true.

By way of contrast, compare W.D. Ross' opposing view (1930: 41): 'For the estimation of the comparative stringency of… *prima facie* obligations no general rules can, so far as I can see, be laid down.' Ross' view is pessimist, but it may well be true, not only for ethics but also for epistemology. It seems unrealistic to suppose that either subject admits of the kind of completeness required by Moore. Only an evaluative monist, perhaps Mill, could reasonably believe otherwise. Mill himself was well aware of this, and made it the basis of scorn for pluralist 'intuitionism'. The pluralist must abandon all hope of attaining Moorean completeness, for there is no *general* answer accessible to our limited intellects to the question of how to resolve value conflicts or moral dilemmas.

Here we must distinguish between a general *method* for resolving such conflicts or dilemmas and its *application*. The value monist can have a method, even if it may be difficult to apply. Thus it may be difficult to tell whether a certain action would lead to more pleasure than any alternative, but at least the monist radical hedonist can tell us that it is right if and only if it does in fact do so.

Even if it turns out that one must in the end yield to pessimism, moreover, one can still reject autonomism. Suppose one resigns oneself to the fact that given epistemic pluralism (several different *basic* sources of justification) there is no possibility of a complete epistemology, such that every correct attribution of justification to a belief would follow logically from the principles of our complete epistemology and certain non-epistemic facts about the belief. Even so, one might still reasonably reject autonomism and accept supervenience by holding that for every justified belief there must be a property ψ (perhaps a very complex relational property) such that:

(1) that belief has ψ,
(2) ψ is not a normative epistemic property, and

(3) necessarily, whatever belief has ψ is a justified belief.

Here again the foundationalist and the coherentist could turn out to be allies. For each could surely carry on despite pessimism in an attempt to specify *as completely as possible* the conditions within which beliefs are justified. Each could retain formal foundationalism as an ideal which we might approach but probably could never reach.

Formal foundationalism leaves open the viability of coherentism even in its most radical forms, therefore, which means that *substantive* foundationalism requires additional support beyond that provided by *formal* foundationalism. We need not rehearse in detail the familiar arguments against radical coherentism, since we are not assessing the merits of that doctrine. But, these objections to coherentism should be detached from the alleged impossibility of an infinite regress of justification.

3 An argument for classical foundationalism

We turn now to the controversy between classical foundationalism (a sort of substantive foundationalism) and epistemic coherentism. Often when we are adequately justified in believing something, *p*, we are so justified on the basis of some inference or argument or adduced reasons. In such cases our belief is *mediately* justified. The foundationalistic thesis might then be put as follows:

(F) If a subject *S* has (epistemically) justified beliefs, not all of the beliefs held by *S* can be only mediately justified: *S* must (sometime) have beliefs that are immediately justified.

What is it for *S* to hold a belief *b* at least partly on the basis of another belief b'? What is it for the ‘basing relation’ *r* to hold thus from *b* to $brsquo;$? One thing seems clearly involved: *S* must hold *b* at least partly because it holds $brsquo;$: the latter must contribute causally to the former. More is presumably involved, but that much is enough to start a foundationalist argument as follows:

(1) There is at least one justified belief held by *S*.
(2) *r*, the basing relation among beliefs, is irreflexive.
(3) *r* is transitive.
(4) There is no infinite sequence of justified beliefs of *S*’s each member of which has a predecessor that bears *r* to it (on which it is based).
(5) Therefore, at least one justified belief held by *S* is based on no belief held by *S*.

The foundationalist concludes that there must be some way for a belief to be justified that does not involve its being based on some *other* already justified belief. Such ‘immediately justified’ beliefs would hence constitute a foundation on which one could erect one’s system of beliefs. One could base *other* beliefs on those that are foundationally, immediately justified.

That argument for foundationalism depends crucially on the premise that the basing relation, *r*, is irreflexive (premise 2). That premise is questionable, however, as follows. The relatively clear core of the basing relation is constituted by the causal contribution relation *c*, and *c* provides a good approximation to *r*. Consider now the ‘ancestral’ of that relation, c^* (roughly the relation that *x* bears to *y* if and only if either *x* bears *c* to *y* or *x* bears *c* to x_1 which bears *c* to x_2 which… which bears *c* to x_n which bears *c* to *y*). So long as we allow not only immediate or direct but, *also*, mediate and indirect basing, c^* provides an even better approximation to the basing relation than does *c*. Is c^* irreflexive? Consider two rigid cards c_1 and c_2 that support each other by each standing on end on a flat surface and leaning on the other. And suppose God creates these, already arranged thus, at a time *t*. In that case, is it not true that, for every *e*, c_1’s being positioned as it is during the interval [*t* to ($t+\varepsilon$)] *partly results* from c_2’s being positioned as it is during that interval, *and conversely*? Take then the relation of causal contribution *c* (the converse of the relation of partial resultance). From the fact that, as we have seen, *c* is not asymmetrical, it follows that c^* is not asymmetrical. Obviously, moreover, c^* is transitive. And it follows that c^* is *not* irreflexive. In our particular example what we are forced to say is that c_1’s being positioned as it is during the interval [*t* to ($t+\varepsilon$)] *results in part* from its being so positioned during that very interval. For this contributes to supporting c_2 which, being thus supported, can return the favour coincidentally.

The case for the irreflexivity of the belief-basing relation presumably rests at least in part on the supposed

irreflexivity of the causal contribution relation (or its ancestral c^*). In any case, once the latter is abandoned this is bound to weaken our intuitive support, such as it is, for accepting the former. And that intuitive support can also be attacked directly in terms of examples such as one in terms of the following five propositions:

(P1) It is drizzling.
(P2) Expanding circles are constantly forming in the puddles.
(P3) There is a pitter-patter on the window panes.
(P4) There was a forecast of drizzle or rain by now.
(P5) Car wipers are on.

If, at a given time, *t*, I believe all five of these, what is wrong with supposing each to be based in part (perhaps in *small* part) on the others?

4 Foundationalism versus coherentism

The beliefs supporting a belief p_1 held by a subject *S* might be thought to form one of at least three possible structures: (1) first, a ‘tree’ that branches infinitely upwards from the ‘root’ node constituted by *S*’s belief p_1; (2) second, a pyramid with foundational beliefs on which rest level after level of beliefs supported by reasoning and leading ultimately to *S*’s belief p_1 at the tip of the pyramid; (3) third, a raft, one of whose planks is *S*’s belief p_1, where each of the many planks is held in place by its ties of coherence with the other planks.

So far the foundationalist has ruled the tree out of the question for limited human minds, and argued against the raft by supposing that such belief structures must be built by means of some causal belief-basing relation that must be both irreflexive and transitive. Given these assumptions, it follows that any justified set of beliefs held by a limited subject must take the form of a foundational pyramid. As we have seen, however, it is questionable whether the relevant causal-contribution and belief-basing relations must be indeed irreflexive. And doubt on the irreflexivity assumption undermines the foregoing line of reasoning for pyramidal foundations of knowledge. We do well to consider another approach.

A belief may be both true and justified without being knowledge. This is shown by any Gettier example in which someone is justified in believing some falsehood *f* from which in turn they deduce a truth, *t*. Their belief that *t* is then both true and justified without being knowledge (see Gettier problems). A particularly striking Gettieresque case is that of the victim of an evil demon who is allowed a *true* belief that he faces a fire, along with a set of necessarily associated truths - one, however, that is minuscule by comparison with the falsehood that massively surrounds it in our victim’s belief set. Concerning the experiences, memories, introspections and reasonings of the victim, there is not the slightest flaw: the victim is, internally, as cognitively worthy as the best of us (see Internalism and externalism in epistemology). In that sense, therefore, the victim is perfectly well justified in believing that they face a nearby fire. And there is indeed such a fire there. But clearly our victim has no knowledge of that fact, despite the fact that the belief is true and well justified, not if their supporting web of beliefs, and their broader belief system, is almost entirely a tissue of falsehoods; so that, for example, their visual, auditory and other experiences as of a fire before them are entirely unaffected by the fire there, and so on.

What is involved in such internal justification? Classical coherentism and foundationalism are best understood, it seems, as accounts of such justification. According to coherentism, one’s belief *b* is thus justified if and only if *b* coheres well enough with one’s system of beliefs. Let us explore this briefly before turning to foundationalism.

Coherence involves the logical, explanatory, and probabilistic relations among one’s beliefs. However, it would not do to attain a tightly interrelated system by merely lopping off whatever beliefs may refuse to fit. Theoretically, it would be possible (perhaps with the aid of advanced cognitive technology) to perform such drastic surgery on one’s belief system. But that would not necessarily yield epistemic justification. Thus take arbitrary beliefs *p* (that the moon is made of cheese) and *q* (that clouds are cotton wool) and surround those beliefs with the likes of $(p \supset q)$, $(q \supset < eixi = "P021p7.22" >< bixi = "P021p7.23" > (p \supset q))$, $(q \supset p)$, $(p \supset (q \supset p))$, and so on. (The ‘ $\supset$’ stands for material implication; so an expression of the form ‘ $x \supset y$’ is shorthand for ‘either not-*x* or *y*’.) The result will be a set that is not only tightly coherent but also as large as one may like. Yet it will obviously lack a desirable sort of scope or comprehensiveness none the less. Such comprehensiveness is hence not just a matter of numerosity; scope of subject matter also counts.

Such comprehensiveness, even when tightly coherent, still will not suffice for justification, however. Take one's I/now perspective. Suppose one replaces one's concepts of (1) oneself, and (2) the present, wherever they may figure in one's vast system of object level beliefs, by corresponding concepts of (1′) the holder of passport number *n*, and (2′) 18 May 1998. This system will nearly match one's original system in true comprehensiveness and in interlocking coherence. Yet there is little semblance of justification in it. One will be wildly unjustified in attributing to the holder of passport number *n*, as of 18 May 1998, the vast set of things that one attributes to oneself now. The coherentist needs to require interlocking comprehensiveness not only with regard to the object level of beliefs, but also in a way that reaches up to meta-levels, where one takes note, at least implicitly, of the sources of one's beliefs and of how reliable these are, and so on. Once this is required, the transformation from the I/now system to the passport number *n*/18 May 1998 system is blocked.

Even that seems insufficient, however, if it is conceivable that such a comprehensively coherent system of beliefs could still fail to mesh properly with the subject's sensory experience. This failure of mesh might occur in either or both of two ways. Someone might experience as if *p* and might have no reason to question or resist such prompting to believe that *p*, but might none the less believe something, that *q*, incompatible with the proposition that *p*, and might even believe that $\sim p$ for good measure. In addition they might have a conspicuous experience *e* - a splitting headache, say - and might none the less believe that they do *not* have such an experience. If such failure of mesh is indeed possible, then it could preclude even a highly coherent and comprehensive system of beliefs from rendering its member beliefs justified.

Coherentism seems well advised to adopt such requirements of (1) comprehensiveness, (2) perspectival content, and (3) mesh with experience. With such needful qualifications and improvements, coherentism is on a rapprochement course with classical foundationalism as accounts of (internal) justification. This seems especially clear in light of the fact that foundationalism, for its part, seems forced to withdraw its objections to mutually supportive beliefs, and must willingly allow that the appropriate internal coherence of a body of beliefs can indeed account for much of the justification that resides in the member beliefs. The potential for a meeting of the minds is evident if we put it this way: the coherence required for epistemic justification in a system of beliefs requires that the system of beliefs be appropriately comprehensive. And this in turn requires that the system of beliefs should include an epistemic (meta) perspective, *and* a suitable complement of *foundational* beliefs! Once it is put thus, the game is obviously up. Both sides score significant points. Coherentism scores for its emphasis on appropriately comprehensive (and perspectival) coherence, an indispensable component of our concluding view. And foundationalism scores for its emphasis on the extra-belief components that are clearly needed in an appropriately justified system: especially the need for appropriate mesh with experience.

Francis of Meyronnes (d. after 1325)

Francis of Meyronnes, the doctor illuminatus *(Enlightened Doctor), was called the 'Prince of the Scotists' for his work in systematizing and propagating the philosophy of Duns Scotus in the fourteenth century. His work in metaphysics and theology, while heavily dependent on Scotus, shows originality and independence of mind, and is characterized by his dedication to finding rational defences of Catholic doctrine. His discussion of Ideas includes a critique of Aristotelian metaphysics, and he argues instead for a position based on his conception of Platonism.*

Born in Provence, Francis joined the Franciscan order and studied theology at the University of Paris, where he was probably a pupil of John Duns Scotus some time between 1304 and 1307. In 1323 he was awarded the degree of Master of Theology. Prior to this, in the academic year 1320-21, he represented the Scotist school in a spirited debate with the Thomist Peter Roger (later Pope Clement VI) over Trinitarian theology. However, Francis was never merely Scotus' mouthpiece, but was an original and creative thinker. He often addressed philosophical issues in ways Scotus did not, and criticized Scotus when he found the latter lacking. Francis's written work, which shows the influence also of Augustine, Pseudo-Dionysius and Avicenna (see Ibn Sina), includes sermons, commentaries on the Bible, studies of theology, metaphysics and moral philosophy, and commentaries on the works of Aristotle, Pseudo-Dionysius and Augustine. His writings became very popular in the later Middle Ages, in particular his *Conflatus*, a revision of his commentary on Book I of Peter Lombard's *Sentences* (see Lombard, P.).

Francis argues that theologians cannot demonstrate the doctrine of the Trinity, but they can defend it against objections. According to this doctrine, as Francis understands it, God is a Trinity of three persons - Father, Son and Holy Spirit - three things, each of which is the same as the divine essence (see Trinity). Francis recognizes that this doctrine is vulnerable to criticism. For instance, the Father begets the Son, and the Son is begotten by the Father. However, the divine essence, which is the same as the Father, does not beget; nor is it begotten, although it is the same as the Son. Either the principle of non-contradiction does not apply to God, or each divine person must be distinct in some way from the divine essence.

Accepting the first alternative would, of course, put an end to all rational inquiry about God. Francis holds instead that each person of the Trinity is distinct in some way from the divine essence. These are not real distinctions, for real distinctions hold between things, and the doctrine of the Trinity maintains that God is three things, not four. Nor, he argues, are the distinctions purely conceptual: mental constructs that do not reflect any distinction in the Trinity itself. The sort of distinction that holds between a person and the divine essence lies between the real and the purely conceptual. Following Scotus, Francis calls this the *formal* distinction.

Scotus makes the formal distinction a cornerstone of his philosophy, and Francis builds on that cornerstone. To say of *x* and *y* that they are formally distinct is to say that they are really the same - they are not two things - but that *x* can be characterized differently than *y*, and the different characterizations accurately capture facts about *x* and *y* and are not simply mental constructs. By appealing to the formal distinction in order to explain how each divine person is rightly characterized in a way different from the essence, Francis attempts both to defend the orthodox doctrine of the Trinity and to preserve the possibility of rational theology. Furthermore, Francis argues, this solution carries the weight of authority. Examining the history of Trinitarian theology, Francis finds that orthodox theologians such as Bonaventure and Aquinas had been working toward this solution, though they had not fully articulated it.

Francis's originality displays itself in the *Conflatus*, in a series of articles on Ideas. He begins by asking whether there are Ideas in the mind of God. Ideas conceived in this way - the way theologians conceive of them - are the eternal, immutable archetypes of created things. Francis, however, does not see any necessity for concluding that there are such Ideas in God's mind. He explores Augustine's reasons for maintaining that there are Ideas in God, but finds them inconclusive. Nevertheless, he finds the view that there are Ideas in God's mind a plausible one, and he is willing to concede this point on the authority of Augustine.

According to Francis, when metaphysicians discuss Ideas, they are referring not to divine, immutable archetypes, but to the quiddities, or defining characteristics, of things. Are these Ideas, as Plato argues, separated from

particulars? Francis recounts the commonly held view that the quiddities are conjoined to individuating conditions in particular things, but the intellect can abstract a quiddity from its individuating condition. According to this view, there are indeed separated Ideas, but only in intellects. Francis rejects this view, offering instead what he takes to be Plato's position: there are separated Ideas prior to any activity of the intellect, and in fact it is the Idea's separation that grounds its abstractability by the intellect. Ideas are separated not only from the individuating conditions, but also from potentiality and actuality, existence, time and place. The Idea *equinity*, for example, is not actual or potential, existent or nonexistent, located in any place or at any time. It is, as Avicenna maintains, just equinity.

The reason so few philosophers have subscribed to Plato's view, Francis suggests, is that Aristotle misrepresented it to posterity. According to Francis - who had almost no direct access to Plato's works - Aristotle ascribes to Plato the ridiculous view that the Ideas are bizarre particulars which exist in the air. Francis thinks that Aristotle, motivated by jealousy, tried to sabotage Plato's reputation. Otherwise we would have to say that although Aristotle was the best natural philosopher, he was the worst metaphysician, because he did not understand abstraction. Plato, Francis supposes, never held that Ideas are separated from particulars locally, but only formally. On Francis' view, the formal distinction is a cornerstone not just of Scotism, but of Platonism as well (see Nominalism; Realism and antirealism).

Frank, Jerome (1889-1957)

Jerome Frank was a significant contributor to the 'realist' movement in US legal theory. He is most closely associated with 'fact scepticism', the view that legal processes, especially court processes, are afflicted with pervasive uncertainty and unpredictability because of the difficulties of finding out with certainty or even strongly justified confidence what happened in the past.

Frank himself distinguished 'fact scepticism' from rule scepticism. By contrast with doubt arising from uncertainty in interpreting rules, 'fact scepticism' concerns the difficulties of finding out about past events, difficulties inevitably exacerbated by the adversarial character of legal processes conducted under common law, most notably where a jury is involved. Since 'facts' in the legal sense are both uncertain and malleable, the personal predilections and intuitions of the trier of fact come to be primary determinants of the practical outcomes of trials and litigations (see Legal evidence and inference §1; Legal reasoning and interpretation §§1,2).

Frank's theoretical views about law arose from his engagement in legal practice and in New Deal politics, and finally from experience as a Federal appellate judge in the USA. Although he taught occasionally at Yale in his later years, he was never a full-time academic lawyer. His philosophical contributions are the reflections of a legal practitioner, not of a philosopher of law. In fact, he came to legal practice with considerable reluctance and under pressure from his family. This may account for the fact that quite early in his career he underwent psychoanalysis, becoming in consequence an advocate of the relevance of Freud's theories to legal understanding. Humans' delusory belief in and search for certainty in law he likened to the search in life for a father-figure as a repository of unquestionable authority. The process of achieving adulthood was the process of abandoning the myths of certainty and acknowledging the irreducible indeterminacy and negotiability of practical life. This case was put vigorously in his *Law and the Modern Mind* (1930), which achieved some standing as an account of realist ideas accessible to the general reader. His later work, culminating in *Courts on Trial* (1949), carried forward his critique of adversarial processes and over-reliance on juries and other characteristic institutions of the common law.

Despite his scepticism concerning the determinability of past facts, he retained an ideal of a legal system that could function more objectively and predictably than the one in which he worked and to which he contributed a great deal both intellectually and judicially. As a judge of the Courts of Appeals for the Second Circuit (a position to which he was appointed by President Roosevelt in 1941), he showed himself to be a friend of civil liberties and a proponent of judicial activism especially in favour of individuals under threat from encroachment by the state. While many commentators have found his doctrines somewhat overstated, and indeed they do contain elements easy to caricature, there is no doubt that Frank left an important mark upon jurisprudence. After him, it has been impossible for serious thought about the judicial process to ignore the crucial elements of fact-finding, evidence and proof, and the special problems attendant on these subjects.

Frank, Semën Liudvigovich (1877-1950)

The philosophy of S.L. Frank was one product of the renewed interest in epistemology, speculative metaphysics and religion among educated Russians in the quarter-century preceding the Revolution of 1917. Frank published the first volume of his philosophical system in 1915, but most of his major works were written after the Revolution, in European exile.

Influenced by tendencies in turn-of-the-century European thought that criticized the exaggerated pretensions of scientific reason, Frank formed the conviction that abstract, conceptual thought was inherently incapable of mastering ultimate reality. A valid metaphysics was nevertheless possible, founded on our capacity for direct, intuitive apprehension of reality in its living concreteness.

In intuitive knowledge, reality discloses itself as a 'total-unity' - an all-embracing unity in which the dualities with which conceptual thought wrestles are overcome without being dissolved. Ultimate reality is itself grounded in, and embraced by, a principle Frank termed 'Divinity', one that manifests itself in religious experience as the personal God of Christian faith. The rootedness of the human person in this divine principle is the condition of possibility of all spiritual creativity - of art, science, morality and law, and religion.

1 Life; sources of his thought

Semën Liudvigovich Frank was born in Moscow, of Jewish parentage. Converted to Marxism at the age of 16, he chose to devote his studies at Moscow University (1894-8) to political economy. In 1899, he was briefly detained by the tsarist police for his involvement in revolutionary activities. He subsequently attended lectures on economics and philosophy at the universities of Berlin and Heidelberg. By 1901, he had ceased to consider himself a Marxist, but remained a proponent of social as well as political democracy for Russia. In 1903, he began his long, intimate journalistic collaboration with P.B. Struve, a pioneer of the philosophical revival and a leading figure in the emerging Russian liberal movement. As a supporter of constitutional government, Frank initially hailed the Russian Revolution of 1905 with enthusiasm; its ultimate failure precipitated major changes in his views. After 1906, Frank was an unsparing critic of socialism; of the many articles he wrote criticizing the beliefs and mentality of the Russian left, the most famous is his contribution to the 1909 *Vekhi* (*Signposts*) symposium (see Signposts Movement §1-3). At this time, he also abandoned the Fichtean idealism professed in his early philosophical writings in favour of the spiritualist metaphysics characteristic of his mature works.

Although Frank now became the advocate of a religious outlook on life, he never returned to Judaism. In 1908, he married a Gentile; in 1912, he was baptized into the Russian Orthodox Church.

Soon after his marriage, Frank resolved upon a career as a professional philosopher. After passing his master's examination at the University of St Petersburg, he was appointed, in 1912, as an unsalaried lecturer there. He subsequently held professorships at the universities of Saratov and Moscow.

Frank was one of many prominent anti-Marxist academics arrested in 1922 and deported from Soviet Russia. He spent the first fifteen years of his exile in Berlin, where he taught at various émigré educational institutions, and, briefly, at the University. His Jewish ancestry led to his dismissal from his posts after Hitler came to power, but he was not able to escape from Germany until 1937. The final dozen years of his life, during which he wrote his last three books, were passed in France and Britain.

In exile, Frank styled himself a 'Christian Platonist', claiming Plotinus and Nicholas of Cusa as his 'masters' in philosophy. But his mature thought was actually shaped by a great variety of philosophical influences. The Kantian tradition, with which he associated himself in his earliest philosophical writings, impressed a permanent stamp on his thinking about epistemology (see Neo-Kantianism). Other, countervailing influences on his mature epistemological views were the writings of Goethe, Bergson, N.O. Lossky and Husserl. Frank's thought on logic was indebted to both Hegel and Hermann Cohen. While his mature metaphysical system bears a broad resemblance to that of Vladimir Solov'ëv (who popularized the term 'total-unity' in Russia), the extent of Solov'ëv's actual impact on Frank has arguably been overstated by historians of Russian philosophy.

2 First philosophy (epistemology, logic, metaphysics)

In his first major work, *Predmet znaniia* (*The Object of Knowledge*) (1915), Frank maintained that epistemology, logic and metaphysics constitute a single philosophical discipline, to which (following Aristotle) he gave the name ‘first philosophy’. Neither epistemology nor logic could claim the rank of an autonomous branch of philosophy, since a correct solution to their fundamental problems could only be attained through an inquiry which brought the problem of knowledge into relation with the problem of being. Metaphysics was not an independent discipline either, since an understanding of the true character of ultimate reality could only be reached by way of an analysis of human knowledge.

Frank distinguished three different modes of knowledge: ‘abstract’ or ‘conceptual’ knowledge; ‘intuition’; and ‘living knowledge’. Abstract knowledge, which relates particular concepts to each other in judgments, is generally thought to be the only kind of knowledge there is: both our everyday understanding of the world and organized science are systems of conceptual judgments. But Frank contended that we cannot explain how abstract knowledge is possible unless we recognize that it is dependent upon a prior form of cognitive access to reality: a direct intuition of being as an integral whole, unmediated by concepts.

The concepts with which abstract knowledge operates are fixed ‘determinations’, subject to the logical laws of identity, contradiction and the excluded middle. To account for our ability to affirm, in the judgment ‘A is B’, a necessary connection between two discrete, mutually exclusive conceptual contents, the philosopher must concede that we already ‘possess’ both A and B in a form in which they are not discrete determinations, but moments of a ‘metalogical unity’ to which these logical laws do not apply. Valid conceptual knowledge becomes possible only after we have intuited the necessary connection between A and B as nondiscrete elements in a continuous whole. This continuous whole is the ‘total-unity’, the all-encompassing unity outside of which nothing is conceivable. All particular knowledge is partial knowledge of this whole; abstract knowledge can be systematic only because the elements of the total-unity constitute a system.

We can possess the total-unity prior to the cognitive acts that engender conceptual knowledge because the total-unity transcends the opposition between being and knowledge; it is not simply ‘being’ but also ‘thought’; it is not objective being (being for a subject) but absolute being, a reality that reveals itself to itself. As existent entities, we humans belong to being; our being is the being of the total-unity. Accordingly, we participate, albeit imperfectly, in the knowledge reality has of itself. This ontological communion we enjoy with the reality we seek to know is the supreme condition of possibility of all knowledge.

In abstract knowledge, and even in intuition, our ontological communion with the object of knowledge is imperfect: the knowing subject remains enclosed in itself and merely sends out ‘rays’ which illuminate its object. Living knowledge, the third mode of knowing distinguished by Frank, involves a much deeper kind of communion with the object: a mutual penetration, as a result of which the knower merges with the thing known and, as it were, experiences it from inside. Living knowledge was not, for Frank, a rare or esoteric phenomenon; it is instanced in every genuine encounter with another ‘I’; in the uncanny insights of the real expert dealing with the objects of their passionate concern; and in all aesthetic, moral and religious experience.

Philosophy itself, as Frank conceived it, is ‘transcendental thinking’: living knowledge of absolute being as the ground of rational, conceptual thought. Since absolute being transcends the oppositions between concepts which are ultimate for abstract knowledge, philosophy can find verbal expression only in the form of ‘antinomian knowledge’. In speaking of the total-unity, the philosopher must couple every affirmative judgment with a negative judgment that logically contradicts it, but in uttering these judgments does not affirm any contradiction within the total-unity itself.

3 The metaphysics of human nature; the doctrine of Godmanhood

Frank’s metaphysics of total-unity provided him with a philosophical framework within which to examine a wide range of questions relating to our place, as human beings, in the universe and to the meaning and purposes of human life. His second book, *Dusha cheloveka* (*Man’s Soul*) (1917) shows that most of the principles which guided his mature thinking on these subjects had been formulated before the Revolution; but his ‘metaphysics of human nature’ and philosophy of religion were fully elaborated only in his writings of the 1930s and 1940s.

The foundation of all Frank’s thinking about human life was a conception of the ‘person’ as a ‘divine-human’ entity. Frank labelled this conception - a complex amalgam of Neoplatonic, Romantic and Christian ideas - the

doctrine of ‘Godmanhood’.

According to Frank, when we contemplate our own inner life - prescinding from the varied interactions with the external world which usually monopolize our conscious attention - we encounter an elusive mode of being which he terms ‘psychic life’ or ‘immediate self-being’. ‘Pure’ psychic life may be characterized as a restless chaos of formless potentiality; but we almost always experience psychic being as ‘formed’ by active forces which penetrate it, organize it and direct its flow into particular channels. Some of the forces which shape psychic life have their origin in this sphere of being itself. But the most exalted of them - those which direct the soul in its highest creative activities - emanate from a sphere of being that lies beyond the threshold of the individual self, the sphere of supra-individual ‘spiritual life’. The true ‘centre’ of the *person* lies outside the individual human self, in the realm of spirit, and through spirit is rooted in the divine principle which grounds all things. To conceive the person as an isolated individuality is the great error of modern humanism, an error which takes its revenge upon humanism in fascist and communist ideology and practice.

True philosophy, for Frank, must therefore be ‘religious’ philosophy. He believed that the eternal truths of religion had found their most perfect historical embodiment in the Christian faith. But a philosophy which is religious, while harmonizing with the essential teachings of Christianity, will rest on universal truths revealed in the philosopher’s own religious and metaphysical experience; it need not derive its premises from the positive revelation preserved by the Church.

4 Social philosophy

Frank outlined the fundamental theses of his social philosophy in *Dukhovnye osnovy obshchestva* (*The Spiritual Foundations of Society*) (1930); in *Svet vo t’me* (*The Light Shineth in Darkness*) (1949), he discussed the dilemmas posed for a Christian social ethics by the power of evil in human affairs.

On the empirical plane, society presents itself to us as an aggregate of competing individuals, who accept a measure of subordination to a guiding social will in the form of personal ‘power’ or impersonal ‘law’. The error of liberal social theory is to suppose that the inner essence of society coincides with this, its external manifestation. In its essence, apparent only to living knowledge, society is a primary ontological reality, no less ‘real’ than the individuals who constitute it, a spiritual communion founded on the shared obligation of service to divine truth. The impossibility of fully realizing the essential nature of human social life in a world subject to sin expresses itself in the unresolvable tension between the demands of inner moral life and the imperatives of law and outward social morality.

Since the late 1980s, many of Frank’s works have been reprinted in Russia. Until then, his influence was largely confined to Russian émigré circles. There, his achievement was much esteemed; V.V. Zenkovsky ranked him as the most eminent of all Russian philosophers. Frank wrote a philosophical prose remarkable for its clarity and concision.

Frankfurt School

The origins of the circle of philosophers and social scientists now known as the Frankfurt School lie in the 1920s when a number of critics and intellectuals were attempting to adapt Marxism to the theoretical and political needs of the time. The distinguishing feature of the approach adopted by the Frankfurt School lies less in its theoretical orientation than in its explicit intention to include each of the disciplines of the social sciences in the project of a critical theory of society. The objectives of this theoretical innovation vis-à-vis all the traditional Marxist approaches were established by Max Horkheimer in various articles written in the 1920s and 1930s. His critique of neo-idealist philosophy and contemporary empiricism sought to develop a philosophy of history which would comprehend the evolution of human reason; in so doing, he drew on empirical research. Thus the Institute of Social Research, conceived as a way of realizing this plan, was founded in 1929. Its work drew on economics, psychology and cultural theory, seeking to analyse, from a historical perspective, how a rational organization of society might be achieved.

However, after the National Socialists came to power and drove the Institute into exile, historical/philosophical optimism gave way to cultural/critical pessimism. Horkheimer and Adorno now saw it as the function of a critical theory of society to try, by returning to the history of civilization, to establish the reasons for the emergence of Fascism and Stalinism. Their Dialectic of Enlightenment, which bears some resemblance to Heidegger, impressively testifies to this change of orientation: it asks why totalitarianism came into being and it identifies a cognitive and practical perspective on the world which, because of its concern with the technical control of objects and persons, only allows for an instrumental rationality.

But there was some opposition to this critique of reason which tended to view totalitarianism as a consequence of an inescapable cycle of instrumental reason and social control. The concept of total reification was called into question by some of the more marginal members of the Institute working under Adorno and Horkheimer. These were far more interested in asking whether, even under totalitarian conditions, they could determine the remains of a desire for communicative solidarity. The work of philosopher Walter Benjamin constitutes an analysis of the interrelation of power and the imagination; Franz Neumann and Otto Kirchheimer inquired into legal consensus culture and social control; while Erich Fromm conducted a psychoanalytic investigation of communicative needs and their potential for resistance.

After the core members of the School had returned from exile, the Institute resumed its work in Frankfurt and embarked on large-scale empirical projects. From the very beginning, however, a considerable gap existed between the empirical investigations which focused on the industrial workplace and the philosophical radicalization of negativity on which Adorno and Horkheimer worked, albeit with differing emphasis. This gap was bridged only when Habermas began to challenge the systematic bases of critical theory, causing the basic philosophical concepts and the intentions of empirical social research once again to correspond. The central idea, with which Habermas introduced a new phase in the history of the Frankfurt School, was his understanding of a form of rationality which would describe the communicative agreement between subjects rather than the instrumental control of things. The concept of communicative rationality which emerged from this idea has since formed the basis for the moral grounds and democratic application of critical theory.

1 Origins and aims of critical theory: Horkheimer and Marcuse

Critical theory stands out from the various attempts to develop a productive model of Marxism which took place between the World Wars. It differed from comparable approaches primarily in its methodological objectives rather than its theoretical principles. These objectives derived from an unquestioned and programmatic acknowledgement of the sciences. Critical theory’s fundamental aim was to include all the disciplines of the social sciences in the project of a materialist theory of society. It thereby overcame the theoretical purism which had long persisted in historical materialism, and made space for the fruitful integration of academic social science and Marxist theory. This methodological vision was most ably represented by Max Horkheimer in whose hands the project of a more broadly interdisciplinary Marxism developed during the 1920s.

When Horkheimer succeeded Grünberg as Director of the Institute for Social Research in 1930, an opportunity presented itself for the realization of this project. He revealed, for the first time, the theoretical programme of a

critical theory of society in his inaugural speech (Horkheimer 1972). In *Zeitschrift für Sozialforschung (Journal for Social Research)*, founded in 1932 and which, until 1941, represented the intellectual centre of the Institute's work, he attempted to develop this approach in collaboration with Herbert Marcuse. The idea of overcoming the scientific and historical gulf which had arisen between factual research and philosophy formed the methodological framework. Following a Hegelian model of history, both branches of knowledge were again to be fused in a single form of reflection to such a degree that the empirical analysis of reality could coincide with the philosophical determination of reason. To achieve this, one needed a theory of history which would be able to determine the powers of reason as they operated within the historical process. Although their interpretative approaches differed, both Horkheimer and Marcuse inherited these basic philosophical-historical conceptions from the tradition of Marxist thought.

In the 1930s, Horkheimer and Marcuse continued to represent the classical Marxist theory of history. According to this, the central mechanism of social progress lies in the development of the forces of production, and as the domination of nature moves through increasingly technical stages, these determine new stages in the relations of production (Horkheimer 1932). Thus critical theory was to enter into this historical development not merely as a cognitive example of the work process, as was the case in the empirical sciences, but as a critical example of society's self-knowledge. It is by critical theory, according to Marcuse and Horkheimer, that we are made conscious of the possibilities which are already developing within the historical situation itself (Marcuse 1937). They no longer believed, however, that rationality, as embodied in the contemporary forces of production, simultaneously finds expression in the revolutionary awareness of the proletariat. From the very beginning they were conscious that, because of the increasing integration of the working classes into the social system of late capitalism, a strictly Marxist theory had lost its social relevance. Hence the empirical analyses, which are regarded as an immanent part of the theory of society which was evolving, should also aim to explain precisely those social and psychic mechanisms by which all potential social resistance has become integrated.

Horkheimer's and Marcuse's preliminary philosophical reflections, not unlike those of their contemporaries Lukács and Korsch, continued along the general lines of a productivist philosophy of history, and the openness of their methodology to empirical social research enabled them to formulate something new. The idea of including all the social sciences in the development of a critical theory of society, as well as the subjects of their empirical research, led them far beyond other contemporary attempts to revive Marxism. As a point of reference for the entire research of the Institute, Horkheimer sought the origin of the psychic mechanisms that prevent the outbreak of conflict between social classes which would otherwise result from the tension due to their economic differences (Horkheimer 1932). This question represents a soberly empirical change in the problem of the revolutionary subject which until this time had been fraught with philosophical and historical difficulty. The focus of the Institute's interdisciplinary investigations throughout the 1930s was now clear, and the projects to which each member contributed their specialist knowledge were to elucidate the specific form of social integration which capitalism had systematically constructed in its post-liberal phase.

To Horkheimer belongs the credit of having defined the form and content of a critical theory of society. He used his position as director to acquire specialists for the wide-ranging tasks of the interdisciplinary research projects, and the Institute's programme emerged from the interconnection of three disciplines. Horkheimer continued to regard the research as being fundamentally based on the economic analysis of the post-liberal phase of capitalism. He entrusted his friend Friedrich Pollock with the task of implementing this analysis and answering the question of whether a different principle of capitalist organization was beginning to emerge from the new, planned economy. The psychological study of the individual's integration into society represented the next stage of inquiry. Erich Fromm, who at this time still spoke for the Freudian Left and the fusion of historical materialism and psychoanalysis, was to implement this project. He started with the proposition that the integration of individuals into the capitalist system of social domination took place alongside the formation and socialization of their psycho-sexual characteristics. Hence he made it his task to investigate the consequences of capitalism's structural change for socialization within the family and individual personality formation. Cultural theory and its analysis of the operations of mass culture completed the Institute's programme of inquiry. Horkheimer's definitions of the object of this cultural analysis were ambivalent, even contradictory (Honneth 1991: 1.1), but within a short time it was focusing on the ways in which adaptations in behaviour were brought about by the media of the new culture industry. Theodor W. Adorno and Leo Löwenthal were entrusted with the study of this pivotal cultural dimension

of the capitalist process of integration.

Horkheimer and his colleagues were able to bring a theoretical unity to this range of subjects by employing a very simple functionalism. This guaranteed a conceptual fusing of the individual studies only because every social process was examined according to its function in the reproduction and development of work within the context of society (see Functionalism in social science). The reasons for this reduction to functionalism were the very historical-philosophical premises which consistently underwrite the thoughts of Marcuse, Adorno and Horkheimer. Because no other type of social activity was allowed other than work, even on the level of social theory only the instrumental forms of social praxis could be considered. But in the face of this functionalism one necessarily loses sight of that very dimension of everyday praxis by which the socialized subjects communicatively reproduce, and creatively learn to direct, their common action (see Honneth 1987).

2 The turn to a negative philosophy of history: Theodor W. Adorno

Within the Institute itself, however, the concept of interdisciplinary social research only existed in a vital and constructive form until the beginning of the 1940s. The articles which Horkheimer contributed to the last issue of the *Zeitschrift für Sozialforschung* in 1941 announced a general change of orientation affecting both the philosophical-historical premises of critical theory and its political conception of itself. While the Institute’s sense of resignation in the face of Fascism increased throughout the 1930s, its work was still sustained by hopes of progress theoretically founded on the Marxist conception of history. In spite of scepticism about the established workers’ parties, Horkheimer still regarded the research of the Institute as an intellectual reflection of the workers’ movement. At the end of the 1930s, however, the world represented by the Institute finally collapsed. The practical-political experience of the closed circle of Fascism, Stalinism and capitalist mass culture, which seemed to have become a totalitarian whole, led Horkheimer and his colleagues to abandon all Marxist conceptions of social progress. It was the change from a positive to a negative concept of work which reshaped critical theory and introduced a new phase in the history of the Institute. Thus a critique of reason and progress, so radical that it could not but cast general doubt on the potential for political revolution within social relations, replaced the conception of progress founded on production.

The outstanding representative of this new conception of critical theory is not Horkheimer but Theodor W. Adorno. His thinking, more than that of anyone else, is marked by the historical experience of Fascism as the fate of civilization. This made him sceptical of the Institute’s original historical-materialist ideas of progress. Moreover, the interests of his intellectual development were so predominantly artistic that he was bound quite naturally to doubt the limited rationalism of the Marxist theoretical tradition. Under the influence of Walter Benjamin he had already started to develop effective methods of aesthetic interpretation for a materialist philosophy of history. In his collaboration with Horkheimer (which intensified during the late 1930s), whose earlier reading of Schopenhauer had prepared him for critical reflections on civilization, Adorno’s scepticism about progress came to the fore. The *Dialectic of Enlightenment* (1947), which they wrote together in the early 1940s, articulated this new theme within a negative philosophy of history. In its philosophical-historical approach this work undoubtedly surpasses the Institute’s earlier efforts. The totalitarian condition which the rise of Fascist systems was bringing to the world was no longer to be explained as a consequence of the conflict between forces and relations of production, but as a consequence of the inner dynamic of the development of human consciousness. Horkheimer and Adorno abandoned the theoretical framework of capitalism and made the process of civilization as a whole their frame of reference. Hence Fascism came to be seen as the final historical stage in a logic of disintegration which is intrinsic to the original form of survival of the species itself. The prehistorical efforts of instrumental thought, by which mankind learns to survive and suppress the diversity of nature, gradually reproduce themselves in the disciplining of mankind’s natural impulses, in the impoverishment of its sensory faculties, and in the development of social power relations. Thus an increasing reification, set in motion by the first acts of domination of nature and reaching its logical conclusion in Fascism, shapes the process of civilization.

Even this philosophical-historical thesis, which implicitly rests on a series of anthropological and ethnological studies and their more recent interpretations, relies on Marxist premises. The prehistory of the human species is reduced to the single dimension of nature’s manipulation by mankind, and thus the development of civilization is interpreted according to a pattern of the domination of nature. But the motifs of Romanticism and *Lebensphilosophie*, which Horkheimer and Adorno take up again in their research, reveal the process of the

adaptation of nature in a completely different light (see Romanticism, German; Lebensphilosophie). If humankind's freedom is seen to lie in its ability to devote itself directly to natural life, every act of instrumental control over nature must be interpreted as one step towards the self-alienation of the species.

Two different points arise from this negative turn in the Marxist philosophy of history. On the one hand the consideration of the process of civilization so categorically excludes the whole sphere of everyday communicative praxis that the social advances which may have occurred can no longer be accommodated. Consequently, the *Dialectic of Enlightenment* is compelled to ignore another dimension of civilization's progress, namely one which is not expressed in the intensification of the forces of production, but in the extension of legal freedoms and the scope for individual action. The second consequence is of a political nature and of no less importance for the development of critical theory: every kind of political praxis is interpreted as a form of coercive action and is therefore excluded from the range of available positive alternatives. Thus Horkheimer and Adorno ultimately deny themselves the possibility of mobilizing their own research activity in the real political sphere. While this conclusion might not lead to complete political self-destruction, it necessitates a conception of revolution which no longer sees even the slightest possibility of political emancipation through the radical overthrow of social relations - instead, it looks toward messianic intervention in the process of civilization. Hence in conclusions such as these, drawn in fact by Horkheimer himself in his essay the 'Authoritarian State' (1942), the *Dialectic of Enlightenment* corresponds with the ideas explored in Benjamin's 'Theses on the Philosophy of History' in which he was attempting to criticize the model of social democratic progress.

3 Neglected margins: Benjamin, Kirchheimer, Neumann, Fromm

The only alternative which could have emerged within the Institute to counter such negativistic theories would have been found within the kind of research practised by Franz Neumann and Otto Kirchheimer. They formed a group, together with Walter Benjamin and later Erich Fromm, who both only briefly or indirectly contributed to the Institute's research. Independently, the work of each of these authors stands for an anti-functionalist impulse which could have called into question the image of a totally administrated society, an image which would inevitably have led to the dual impasse of political self-destruction or revolutionary messianism. But the dominating philosophical position of Adorno, Horkheimer and Marcuse never allowed such alternative theoretical approaches to be properly represented within the Institute (Honneth 1987).

Neumann and Kirchheimer, who were both trained in jurisprudence and had come of political age in German social democracy, contributed legal and constitutional investigations to the work of the Institute from their New York exile. Their scholarly and political background convinced them from the outset that the Law is a central medium of control in bourgeois society. Within the rules of constitutional law they recognized the social substance of a political compromise which the different classes, variously empowered by the conditions of private capitalism, all agreed upon. This social-theoretical premise provided the background for the analyses in which Neumann and Kirchheimer examined the changes in constitutional law which accompanied the structural change of the economy under capitalism (Neumann 1978; Kirchheimer 1976). Thus they are far better able to account for the political and legal mediations of capitalist rule than Adorno and Horkheimer who, following Pollock's state capitalism thesis, had been bound to the model of a centrally controlled society.

What also makes Neumann and Kirchheimer's conception superior are the social-theoretical ideas which tacitly influence their investigations. From the outset they perceived the social order from a different perspective than that which prevailed in Horkheimer's circle. For them, social integration represents a process which does not just take place over and above the always unconscious fulfilment of the functional imperatives of society, but via political communication between the social groups. Dealing with questions concerning the constitutional state had brought Neumann and Kirchheimer up against the phenomenon of political legitimacy; thence arose the view that the constitutional order of society is always the expression of a general compromise or consensus between the political powers. Active interest in class disputes, characteristic of the Weimar Republic, led to a realistic assessment of the power relations of social interests; the power which arose from private-capitalist control of the means of production could not be overestimated. The compromise character of the social order as a whole was finally revealed to them through their work on Austro-Marxism: the institutional structures of a society must be understood as nothing other than momentary determinations of social contracts in which the various interest groups are implicated according to their particular power potential.

Within Neumann's and Kirchheimer's thinking this all makes for a concept of society at the centre of which stands the overarching process of communication between social groups. If this concept had been used to direct the Institute's theoretical inquiries, it would not only have prevented the uncritical adoption of ideas of the total integration of society, but could also have opened up new modes of political orientation for its own research.

4 Continuation and revision of critical theory: Jürgen Habermas

When the Institute for Social Research re-opened in Frankfurt in 1950, it resumed its research activities without direct reference to its socio-philosophical identity of the previous two decades. During the post-war years, the unifying theoretical line which could have linked the empirical research and philosophical reflection was broken. The unity and coherence of the Frankfurt School no longer existed.

While scarcely any common denominator could be found for the empirical research projects of the Institute, the idea of a 'totally administrated world' came to represent a standard (if temporary) point of reference for the socio-philosophical work. This idea runs through the cultural-critical writing of Horkheimer, Adorno and Marcuse like a leitmotif; the central premise of the state-capitalism theory became the general framework for an analysis of post-war capitalism. Hence the theoretical perspective on totalitarianism, which had already shaped the image of society in the *Dialectic of Enlightenment*, also determined the current investigations. Because administrative social control and the individual's readiness to adapt were meshed seamlessly together, the life of society seemed to be integrated in a stable and now unassailable system of coercion. The three authors drew quite different conclusions for the project of a critical theory of society from their common diagnoses of the present. Horkheimer's thinking was affected by a deepening Schopenhauerian pessimism until it turned to negative theology (Horkheimer 1985). Adorno continued to pursue a self-critique of conceptual thought in which the idea of a mimetic rationality, vicariously preserved in the work of art, remained the normative point of reference (Adorno 1973). Marcuse alone reacted to the pessimistic diagnosis of the present situation with an impulse to save the lost idea of revolution, thereby repositioning reason below the social threshold, in the sphere of the natural libidinal needs of mankind (Marcuse 1955).

In spite of their different objectives, the common background to these three approaches remained a philosophy of history in which historical development is interpreted as a process of technological rationalization which reaches its conclusion in the closed system of rule of contemporary society. Only one theory, at first scarcely recognizable as a point of departure within critical theory, relinquished the philosophical premises of this diagnosis. Jürgen Habermas had emerged from the Institute of Social Research as Adorno's assistant. Yet his theoretical origins and orientation had never had much in common with the philosophical tradition of critical theory; more significant for the development of his thought were the theoretical movements of philosophical anthropology, hermeneutics, pragmatism and linguistic analysis, to which the older generation remained hostile. Nevertheless, from the work of Habermas a theory gradually took shape which was so clearly motivated by the original aims of critical theory that it counts today as the only serious attempt at theoretical renewal.

The insight into the linguistic intersubjectivity of social action forms the basis of this theory. Habermas arrived at his central premise through studying hermeneutic philosophy and the linguistic analysis of Wittgenstein, from which he learned that human subjects are always already linked through the medium of language. The human form of life is distinguished by an intersubjectivity embodied in the structures of language; linguistic communication between subjects constitutes an absolutely fundamental prerequisite for the reproduction of social life. Habermas gives this thesis socio-theoretical weight by making it the starting point of a debate with the socio-philosophical and sociological tradition. He is critical of the tendency of modern social philosophy gradually to reduce all practical intersubjective interests to decisions based on technical criteria (Habermas 1968). Against sociological functionalism he asserts that a society's tasks of reproduction are always fixed by the normative self-conceptions of the socialized communicative subjects. Consequently the necessary functions of life as such are nowhere to be found in the relations of human life (Habermas 1963). He is therefore also led to a critique of Marxism which results in an expanded conception of the theory of action within history. If the human form of life is distinguished by the medium of linguistic communication, then social reproduction cannot be reduced, as it was in the theoretical writings of Marx, to the single dimension of work. Rather, the praxis of linguistically-mediated interaction must be regarded as no less fundamental a dimension of the history of mankind than the activity of manipulating nature (Habermas 1971).

But the decisive step taken by Habermas towards his own theory of society, and hence a revision of critical theory, came about through his investing both concepts of action (work and interaction) with different categories of rationality. Within the subsystem of rationalized action in which the social tasks of work and political administration are organized, the species develops through the accumulation of technical and strategic knowledge. But within the institutional frame, in which the integrating norms of society are reproduced, it continues to develop by means of the liberation of communicative constraints (Habermas 1970). During the 1970s, Habermas' ramifications of his theory follow this concept of society, whereby rationalized systems are differentiated from the sphere of everyday communicative praxis, and separate forms of rationalization are postulated for each social sphere. A universal pragmatism further elucidates the linguistic infrastructure of communicative action; a theory of social evolution is to help resolve the logic of the development of social knowledge and thus the dual process of rationalization; and finally, the further development of systematic theoretical conceptions is intended to determine the mechanisms through which areas of social activity evolve into rationalized systems.

Although these theoretical endeavours reach into the most diverse fields of knowledge, they all aim to establish a critique of society with a basis in the theory of communication. Thus in seeking to prove that the rationality of communicative action is so fundamental a condition of social development, Habermas' work constitutes a critique of Adorno's and Horkheimer's biased thesis, revealing their diagnoses of the tendencies of instrumental reification to be forms of social rationalization wholly defined by functionalism. In the *Theory of Communicative Action* (1987) this programme is systematized for the first time. The fruits of the various studies are brought together to reconstruct the rationality of communicative action within the context of a speech-act theory, to develop it into the basis of a theory of society by going through the history of sociological theories, and finally, to make it the point of reference for a critical diagnosis of the present (see Communicative rationality).

One of Habermas' most recent studies can be understood as an answer to the pessimistic thesis in which claims are made for a tendency towards the colonization of the living world. In *Between Facts and Norms* (1992) he reconstructs, in the form of a critical legal philosophy, the legal and cultural conditions under which the project of a further democratization of our society can be continued today.

Franklin, Benjamin (1709-70)

Benjamin Franklin was a candlemaker's son who became a successful businessman, politician, diplomat, scientist, philosopher, writer, and social reformer. He played a major role in winning American independence and in American intellectual history. In philosophy Franklin was a deist, and struggled much with problems of morality and determinism.

Benjamin Franklin was born on 17 January 1706 in Boston, Massachusetts. He was apprenticed to his brother James to become a printer. James Franklin was a freethinker, under whose influence Benjamin became a deist (see Deism). After his brother's arrest, Benjamin went to Philadelphia in 1723. In 1725 he went to England, and while there published *A Dissertation on Liberty and Necessity, Pleasure and Pain* (1725). In this work, Franklin adopted an extreme deism based on Newtonian mechanics (see Newton, I.); he asserted a total determinism, which, together with the claim that God is perfect, led to the conclusion that whatever is is right, and to a complete denial of a self-determining human will. He viewed people as machines governed by pain and pleasure, the latter defined as the absence of pain, and claimed that since all pain ends at death, the amounts of pain and pleasure in life are always equal. He denied the existence of an afterlife or any difference in merit or demerit among creatures; all are equal since all do what God ordains.

Returning to Philadelphia in 1726, Franklin became a successful printer, and revised his earlier extreme views. By 1732 the belief that God commands prayers, which, according to the necessitarian view he had espoused, would be pointless, led Franklin to conclude that God has endowed us with free will, and does directly intervene in human affairs. The admission of free will introduced virtue and vice, and, influenced by the benevolence morality of the time, Franklin concluded that virtue consists in doing good to others. He believed this could best be done by helping others to become able to provide for themselves. This he thought was possible through the universal ownership of property; thus property had a moral function for him. Such ownership would make people free to engage in disinterested benevolence, serving the public good. Franklin was thus a believer in the doctrine of civic virtue, which he practiced through social reform and politics, particularly after he retired from business in 1748.

In 1747 Franklin began working on electricity. He was the foremost American scientist of his century. His one-fluid theory of electricity, his law of the conservation of electric charge, and his demonstration of the electrical character of lightning, made him an international celebrity and won him honorary degrees from Oxford and Cambridge. Franklin capitalized on his fame to serve first Pennsylvania and then the Colonies as their representative in England and subsequently in France. He was a member of the committee that drafted the Declaration of Independence in 1776. The treaty with France, which he negotiated in 1778, gave the colonies the French support necessary to achieve independence. He was a negotiator of the peace treaty with England, and served in the convention that drafted the Constitution of the United States.

Free logics

We often need to reason about things that do not - or may not - exist. We might, for example, want to prove that there is no highest prime number by assuming its existence and deriving a contradiction. Our ordinary formal logic, however (that is, anything including standard quantification theory), automatically assumes that every singular term used has a denotation: if you can use the term 'God' - if that term is part of your language - automatically there is a denotation for it, that is, God exists. Some logicians have thought that this assumption prejudges too many important issues, and that it is best to get rid of it. So they have constructed logics free of this assumption, called 'free logics'.

A 'free logic' is a system of quantification theory, with or without identity, that allows for non-denoting singular terms. In other words, some of the expressions that may be considered singular terms - individual constants, free variables, definite or indefinite descriptions - are not assigned any object in some of the models of the system. In a system of *standard* quantification theory, schemata such as $\exists x(x = a)$ are logical truths; not so in free logics. Free logics reject the 'principle of particularization', $A(t/x) \supset \exists xA$, and all equivalent principles or rules, among them the 'principle of specification', $\forall xA \supset A(t/x)$, and the rules of existential generalization and universal instantiation.

Historically, contemporary logicians since Frege have tended to dispense with non-denoting singular terms, adopting either Frege's device of assigning them an arbitrary denotation or Russell's of denying them singular term status (via his theory of descriptions; see Descriptions). It was Henry Leonard (1956) who first proposed that standard quantification theory be revised to allow for non-denoting singular terms. Subsequently, Hailperin, Leblanc, Hintikka, Lambert and Smiley proposed various formal systems to this effect (between 1959 and 1967 - see Lambert 1991). But, until the mid-1960s, no semantic interpretation of these systems was provided, for good reason.

Standard semantics is based on the 'correspondence theory of truth': a statement such as 'Socrates is wise' is true if and only if the object corresponding to 'Socrates' has the property corresponding to 'wise'. But this scheme has no natural application to statements such as 'Pegasus is white', relating to nonexistent objects. So a semantics for a free logic (a 'free semantics') should provide for some alternative (or extension) to the correspondence theory, to account for those cases in which a singular term 'corresponds to' nothing - a problem for which it is difficult to find an uncontroversial solution.

There are currently three main kinds of free semantics. An 'outer domain' semantics adds to the ordinary domain of quantification a second ('outer') domain and allows singular terms to be interpreted on either domain. Intuitively, the outer domain is constituted by nonexistent objects and the reason why 'Pegasus is white', say, is true is that the nonexistent object corresponding to 'Pegasus' has the property corresponding to 'white'. A 'conventional' free semantics assigns a single truth-value (usually False) to all atomic formulas containing non-denoting singular terms, and then evaluates complex formulas accordingly. Both conventional and outer domain semantics are bivalent, and strong soundness and completeness theorems can be proved for them; that is, not only the set of logically true formulas but also the set of valid arguments can be axiomatized. Not so with the third kind of free semantics, 'supervaluational' semantics, due principally to Bas van Fraassen. This assigns truth-values to formulas containing non-denoting singular terms (relative to a model *M*), either by convention or by extending the domain, and then defines a 'supervaluation' (on *M*) that makes a formula true if it is true under all such assignments, false if it is false under all such assignments, and truth-valueless otherwise.

For illustration, suppose *a* is non-denoting in the model M, and consider the following formulas:

(1) Pa
(2) $\sim Pa$
(3) $Pa \vee \sim Pa$
(4) $Pa \;\&\; \sim Pa$.

There will be conventions on M (or extensions of its domain) that make (1) true, and others that make it false, and similarly for (2); so the supervaluation on M will leave both (1) and (2) truth-valueless. But *all* these conventions

(or extensions) will make (3) true and (4) false; so the supervaluation on M will agree on assigning them these truth-values. Intuitively, supervaluational semantics makes a statement containing non-denoting singular terms true (false) if it would be true (false) were its atomic components containing non-denoting singular terms to have *any* combination of truth-values (or its non-denoting singular terms to have *any* combination of denotations) - a ‘counterfactual’ theory of truth, as it is sometimes called.

Free logics have been applied in other parts of logic and to the formalization of scientific theories. Most typical of an application of the first kind is modal quantification theory, where a free logic base is quite natural (for consider: in the presence of the rule of ‘necessitation’, the theorem $\exists x(x = a)$ of standard quantification theory can be strengthened to $\Box\exists x(x = a)$ - that is, whatever we can name not only exists, but exists necessarily). Most typical of an application of the second kind is set theory, where a free logic base will let us use the *name* of, say, the Russellian set $\{x\colon x \notin x\}$ without being committed to its *existence* - indeed, while being able to prove that it does not exist (it cannot, by Russell’s paradox).

Finally, free logics must be distinguished from ‘inclusive’ logics, that is, logics that allow for an empty domain of quantification. Though it is natural to require inclusiveness of a free logic, and though indeed most free logics are also inclusive, the definitions of the two are distinct, and independent of one another.

Free logics, philosophical issues in

The expression 'free logic' is a contraction of the more cumbersome 'logic free of existence assumptions with respect to both its general terms (predicates) and its singular terms'. Its most distinctive feature is the rejection of the principle of universal specification, a principle of classical predicate logic which licenses the logical truth of statements such as 'If everything rotates then (the planet) Mars rotates'. If a free logic contains the general term 'exists', this principle is replaced by a restricted version, one which licenses the logical truth only of statements such as 'If everything rotates then Mars rotates, provided that Mars exists'. If the free logic does not contain the general term 'exists', but contains the term 'is the same as', the principle is replaced by a version which licenses only statements such as 'If everything rotates then Mars rotates, provided that there is an object the same as Mars'.

Most free logicians regard the restricted version of universal specification as simply making explicit an implicit assumption, namely, that Mars exists. Indeed, free logic is the culmination of a long historical trend to rid logic of existence assumptions with respect to its terms. Just as classical predicate logic purports to be free of the hidden existence assumptions which pervaded the medieval theory of inference with respect to its general terms, so free logic rids classical predicate logic of hidden existence assumptions with respect to its singular terms.

There are various kinds of free logic, with many interesting and novel philosophical applications. These cover a wide range of issues from the philosophy of mathematics to the philosophy of religion. In addition to the issue of how to analyse singular existence statements, of the form '3 + 7 exists' and 'That than which nothing greater can be conceived exists', of special importance are issues in the theory of definite descriptions, set theory, the theory of reference, modal logic and the theory of complex general terms.

1 Kinds of free logic

Though there are various historical antecedents of free logic, it is a relatively recent development in the logic of terms - that is, in the development of predicate logic with or without identity. In fact, serious technical and philosophical study of this alternative to classical predicate logic originated only in the second half of the twentieth century with Henry Leonard's 1956 paper, 'Logic of Existence'. The technical rudiments of free logic were then worked out in the subsequent decade and a half, the expression 'free logic' being first coined in 1960 (by Karel Lambert). Since then many studies discussing or employing free logic in general philosophy, philosophical logic and in the philosophy of science have appeared.

'Free logic' is short for 'logic free of existence assumptions with respect to both its general terms (predicates) and its singular terms'. It restricts the principle of universal specification (which licenses the logical truth of statements such as 'If everything rotates then (the planet) Mars rotates') to a version which licenses only statements such as 'If everything rotates then Mars rotates, provided that Mars exists' (if the logic contains the general term 'exists') or such as 'If everything rotates then Mars rotates, provided that there is an object the same as Mars' (if the free logic does not contain the general term 'exists', but contains the term 'is the same as').

When a free logic also entertains the empty universe of discourse, it is called a universally free logic. In such comprehensive free logics, statements (perhaps without singular terms) such as 'There is an object which is tall or is not tall' and 'There is an object which is self-identical' - statements which Russell (§§9, 11) regarded as impure logical truths because of the evidently factual implication that there exists at least one thing - are also excluded from the class of logical truths.

In any free logic, universal or otherwise, the quantifier context 'There is an object…' has existential force just as it does in classical predicate logic. So in any free logic containing the general term 'is the same as' (the identity symbol), a statement such as 'Mars exists' can be taken as shorthand for the statement 'There is an object the same as Mars'. Indeed, statements of the latter form can be false in free logic with identity, and hence, in contrast to classical predicate logic with identity, are not logically true. An example is the false statement 'There is an object the same as (the planet) Vulcan'.

Free logics may be divided into three classes depending on the treatment of atomic (or simple) statements containing at least one singular term *t* such that the statement '*t* exists' is false. For example, the statement 'Vulcan

rotates' is an atomic statement containing a singular term, 'Vulcan', such that 'Vulcan exists' is false. Those which count all such statements as false are called 'negative', those which regard some such statements as true are called 'positive', and those which assign no truth-value at all to such statements - except perhaps statements of the form 'Mars exists'(or 'Vulcan exists') - are called 'neutral'.

In virtue of these different views about the truth-value of atomic statements with singular terms that refer to no existent object there is a significant inferential difference between the different kinds of free logic. For only in negative free logic does a version of the classical principle of particularization hold. In a negative free logic, the principle of particularization licenses the logical truth of the conditional statement 'If Vulcan rotates then there is an object which rotates' because the antecedent, 'Vulcan rotates', is an atomic statement. This does not alter the falsity of the conditional 'If Vulcan is not an object then there is an object which is not an object' because its (true) antecedent, 'Vulcan is not an object', is not atomic.

The kind of free logic one adopts has epistemological significance. For instance, when Descartes' declaration 'I think, therefore I am [exist]' is construed as an argument and formulated in a positive free logic it is invalid. For when the singular term 'I' is replaced by the singular term 'Sherlock Holmes', and the general term 'think' is replaced by the general term 'is self-identical', the resulting premise 'Sherlock Holmes is self-identical' is true in virtually any positive free logic but the resulting conclusion 'Sherlock Holmes exists' is false. On the other hand, if formulated in a negative or neutral free logic, Descartes' argument is valid because the premise is either false or without truth-value when 'I' is replaced by a singular term such as 'Sherlock Holmes', no matter what general term is substituted for 'thinks'.

2 Philosophical semantics

It is a common misunderstanding that in free logics some singular terms need not refer. There do exist, however, semantic developments of free logics which entertain disjoint (and possibly empty) universes of discourse. Usually (though not always) these are philosophically interpreted as sets of existent objects and sets of nonexistent objects, after Alexius Meinong. In such developments, a singular term *always* refers, but not always to an existent object - the singular term, 'Sherlock Holmes', for example, may be taken to refer to a nonexistent (fictional) object. On the other hand, there also exist semantic treatments of free logic with a single (and possibly empty) universe of discourse. This is virtually always interpreted philosophically as the set of existent objects, after Russell. In such developments, a singular term can fail to refer to an existent object, and hence to any thing at all. Since free logics can be based on either Meinongian or Russellian ontologies, it is only correct to say that in such logics a singular term may fail to refer to an *existent* object. In free logics, successful or failed reference is explained as follows. Let '*X*' be a place-holder for the name of a singular term, and let '' be a place-holder for the singular term named. Then a statement of the form '*X* refers (to an existent object)' is true if and only if a statement of the form ' exists' is true - hence, when the language contains identity, if and only if a statement of the form 'There exists an object the same as ' is true. For example, the statement 'The satellite of the Earth refers (to an existent object)' is true if and only if the statement 'The satellite of the Earth exists' is true (or, if the language contains identity, if and only if the statement 'There is an object the same as the satellite of the Earth' is true).

The quantifiers of free logic can be interpreted either objectually or substitutionally (see Quantifiers, substitutional and objectual); if interpreted in the latter way, then it is necessary to say in the clause for a quantifier context of the form 'There is an object such that it ' that it is true just in case a sentence of the form 'it ' becomes true when 'it' is replaced by some name '*n*' such that '*n* exists' is true. This condition is needed to give the quantifier context in question the requisite existential force. In current parlance, quantifier contexts of the form 'There is an object such that it ' in free logic are 'actualist'. Treatments seeking to preserve classical predicate logic by interpreting the quantifier context in question substitutionally while nevertheless admitting singular terms that refer to no existent object are not free logics because that quantifier context has no existential force; it is, in other words, 'non-actualist' in such treatments.

3 Implications and applications

Free logics are not committed to the philosophical doctrine that existence is a 'predicate' (see Existence) - indeed, there are free logics without identity or an existence symbol. Neither are they committed to the philosophical doctrine that proper names are truncated definite descriptions. They are not even committed to the doctrine that the

reference of most grammatically proper names is determined by the reference of some description, a view often attributed to Frege and Russell (see Proper names §1). But an important result in the proof theory of positive free logic does bear on the traditional problem of defining (and, hence, explaining away) existence. Since it can be shown that, in the otherwise classical formal idiom minus identity, statements of the form 'Mars exists' (or 'Vulcan exists') are not definable in positive free logics, then, if one chooses to couch one's logic of an existence predicate in positive free logic, that predicate cannot be eliminated save by means of the complex general term (predicate) 'is the same as something' or its equivalents.

Applications of free logic to important philosophical concerns are numerous. They range from the philosophy of mathematics to the philosophy of religion. Of special philosophical importance are the topics of definite descriptions, modality, the notion of reference, set theory and the theory of complex predicates.

In contrast to the Fregean tradition, which assigns an existent, sometimes arbitrarily, as referent to 'unfulfilled' definite descriptions such as 'the planet Vulcan', in contrast to the Russellian tradition which treats all definite descriptions as grammatical but not as genuine singular terms, and in contrast to the Hilbert-Bernays tradition which regards unfulfilled definite descriptions as formally ungrammatical (ill-formed), free theories of definite descriptions hold all definite descriptions to be genuine singular terms, but do not regard unfulfilled definite descriptions as referring to existents if they refer at all (see Descriptions). More precisely, in free theories of definite descriptions, if the noun or noun phrase following the word 'the' in a definite description is not true of exactly one existent thing, then it refers to no existent thing if it refers at all.

Free theories of definite descriptions are all based on the basic principle that

Everything is such that *it* is the same as *the* if and only if *it* and *it only* is .

This principle is known as Lambert's Law in the literature. Free theories of definite descriptions form a continuum. At one end there is a Russell-like theory which counts all atomic statements having at least one unfulfilled definite description as false, and contains scope distinctions *à la* Russell. At the other end there is a Frege-like theory which counts all atomic identity statements having only unfulfilled definite descriptions as true, and collapses all scope distinctions held to be dependent on definite descriptions. There are also a multitude of intermediate cases in the literature which, in contrast to the other traditions, is dramatic evidence of the fecundity of free logic in the logical treatment of definite descriptions.

In many, if not most, treatments of the logic of singular and general terms, supplemented by the logical modalities 'it is necessary that' and 'it is possible that', the purely quantificational fragment is free. For in such developments, the conditional

C If every (existent) thing exists, then Mars exists,

an instance of the classical principle of universal specification, is rejected on the ground that it leads, via unimpeachable modal principles, to the conditional

C^* If necessarily every (existent) thing exists, then necessarily Mars exists.

But C^* is false because though 'Necessarily every (existent) thing exists' is true, 'Necessarily Mars exists' is false. In contrast, the principle of restricted universal specification yields only the innocent and trivial

C^+ If necessarily every (existent) thing exists then necessarily Mars exists, *provided that* necessarily Mars exists.

The various treatments of free logic can influence the relationship between the meta-logical notion of reference and the logical notion of identity, the relationship reflected in the traditional adequacy condition that, for example, the singular term 'the planet causing the perturbations in the orbit of Mercury' refers to Vulcan if and only if the planet causing the perturbations in the orbit of Mercury is the same as Vulcan. To clarify the point, suppose the singular term 'the planet causing the perturbations in the orbit of Mercury' is replaced throughout the adequacy condition by the singular term 'Vulcan'. Then one obtains the special case that 'Vulcan' refers to Vulcan if and only if Vulcan is the same as Vulcan. Clearly the traditional adequacy condition is sustained in negative free logics because both the reference claim and the identity claim are false since there exists no such object as Vulcan. Similarly, if the free logic is positive, but treats all singular terms as referring, in the spirit of Meinong, then the

traditional adequacy condition is also sustained because both the identity claim and the reference claim will be true. However, if the free logic is positive and it recognizes that some singular terms do not refer, in the spirit of Russell, the traditional adequacy condition may have to be altered; in such a version of free logic, it is false that ‘Vulcan’ refers to Vulcan if Vulcan does not exist, but usually it is true that Vulcan is identical with Vulcan. In such a treatment of positive free logic the relationship between reference and identity is expressed in the following way: ‘the planet causing the perturbations in the orbit of Mercury’ refers to Vulcan if and only if Vulcan exists and the planet causing the perturbations in the orbit of Mercury is the same as Vulcan.

Free logic also exerts an influence in set theory; in free set theory, for instance, the naïve axiom of set abstraction, from which Russell deduced his famous paradox, is assertible without condition (see Paradoxes of set and property §4). Because of the replacement of universal specification by the restricted version of that principle, the most that can be deduced from the statement ‘Everything is a member of the set of sets which are not members of themselves if and only if it is not a member of itself’, an instance of the naïve principle of set abstraction, is that the set of all sets which are not members of themselves does not exist.

A final application of free logic concerns the important topic of complex general terms. In certain developments of free logic, both positive and negative, devices exist for generating complex general terms out of ‘open’ sentences, which are expressions without truth-value of the form ‘it rotates’. For instance, the open sentence in question can be turned into the complex general term ‘object such that it rotates’ by prefixing to it the general term-forming operator ‘object such that’. Then applying that complex general term to the singular term ‘Vulcan’ yields an expression capable of having a truth-value, the statement ‘Vulcan is an object such that it rotates’. In some developments this statement is equivalent to the statement ‘Vulcan rotates’ if and only if it is true that Vulcan exists. The result is a free logic in which scope distinctions with respect to the connective ‘it is not the case that’ can be made over the whole class of singular terms and not just with respect to the class of definite descriptions. For instance, in the developments in question, ‘Vulcan is an object such that it does not rotate’ may be false, although ‘It is not the case that Vulcan is an object such that it rotates’ may be true. If, however, ‘Vulcan’ is replaced by ‘Mars’, the distinction between negation in the general term and negation over the whole statement collapses because the resulting statements have the same truth-value in virtue of the existence of Mars. Indeed, the means are available in these augmented free logics to make a distinction in general between *de re* and *de dicto* predicates or properties (see De re/de dicto). In such treatments, ‘*t* exists’ can now be defined even if identity is not present - as Arthur Prior once anticipated. The requisite definition is that ‘*t* exists’ means ‘For any general term *G*, it is *not* the case that *t* is an object such that it is *G* if and only if *t* is an object such that it is *not* the case that it is *G*’. More idiomatically, the definition says that an object exists just in case denying it is *G* is tantamount to asserting it is *non-G*, and vice versa, for any *G*.

Freedom and liberty

There are at least two basic ideas in the conceptual complex we call 'freedom'; namely, rightful self-government (autonomy), and the overall ability to do, choose or achieve things, which can be called 'optionality' and defined as the possession of open options. To be autonomous is to be free in the sense of 'self-governing' and 'independent', in a manner analogous to that in which sovereign nation states are free. Optionality is when a person has an open option in respect to some possible action, x*, when nothing in the objective circumstances prevents them from doing* x *should they choose to do so, and nothing requires them to do* x *should they choose not to. One has freedom of action when one can do what one wills, but in order to have the full benefit of optionality, it must be supplemented by freedom of choice (free will), which consists in being able to will what one wants to will, free of internal psychological impediments. Autonomy and optionality can vary independently of one another. A great deal of one can coexist with very little of the other.*

Perhaps the most controversial philosophical question about the analysis of freedom concerns its relation to wants or desires. Some philosophers maintain that only the actual wants that a person has at a given time are relevant to their freedom, and that a person is free to the extent that they can do what they want, even if they can do very little else. Other philosophers, urging that the function of freedom is to provide 'breathing space', insist that freedom is a function of a person's ability to satisfy possible (hypothetical) as well as actual wants. A third group consists of those who hold a 'value-oriented' theory according to which freedom is not merely the power of doing what one wants or may come to want, rather it is the capacity of doing something 'worth doing or enjoying', something that is important or significant to the person said to be free, or to others.

1 Freedom and liberty

These two terms are often used interchangeably, but on those occasions when they are not taken to be synonyms, the basis of the distinction between the two is usually clear. 'Freedom', when applied to persons and their actions, refers to the *ability* of a person in a given set of circumstances to act in some particular way. 'Liberty' refers to authoritative *permission* to act in some particular way. The contrast is a basis for the grammatical distinction between 'can' and 'may', between the *de facto* and the *de jure* perspectives, or between (overall) ability and permission.

The concept of a liberty is an important part of juridical systems. A set of governing rules can impose *duties* on those who are subject to their authority. But when the rules remain silent about a given type of activity, *x*, then they are said to leave the subjects *at liberty* to *x* or not to *x*, or however they see fit. To be at liberty to *x* is simply to have no duty not to *x* (see Rights §2).

So conceived, freedom and liberty can vary independently. For example, when a statute is only sporadically enforced, if at all, it may leave a person's *de facto* ability to do what it prohibits virtually unimpaired. Thus a cohabiting unmarried couple in Arizona is perfectly capable of doing what the law prohibits only because the law in question is hardly ever enforced. Cohabiting couples have almost perfect *de facto* freedom to cohabit because police indifference makes the risk of detection and conviction minimal. Not only are we sometimes free (to some degree or other) to do what we are not at liberty to do; conversely, we may be at liberty to do what we are not free to do, as when circumstances other than enforced rules prevent us from doing what we are legally permitted to do.

2 Freedom as autonomy

Judgments of freedom are made not only about individual persons but also about their political communities. Many nation states at some point in their histories have had occasion to declare their independence or, what amounts to the same thing, their sovereignty or status as free states. At the same time, other countries may have lost their freedom (independence) and become mere colonies of stronger nation states. When a political state becomes unfree in this way, each citizen can think of themselves as also deprived of the same kind of freedom, or something analogous to it, for few of them remain entirely self-governed when their own country is governed from afar by masters who simply impose their directives by force. 'None of us are truly free so long as our nation is not', a local patriot might say, even while conceding that the colonial power that governs them has treated them decently, allowing them many freedoms. The question of who rightly governs them, as Sir Isaiah Berlin puts it, is

logically distinct from the question of how their governors - foreign or domestic, legitimate or not - protect their liberties (Berlin 1958). The first question concerns autonomy; the second concerns optionality.

Autonomy and optionality also can vary independently. National autonomy can produce its own tyranny, as when a newly independent nation, free of its colonial repressors, refuses to govern democratically and recognizes no civil rights in its subjects. In such a case the native populace may feel as badly mistreated, if not worse, by their own government as before by the colonizers.

Autonomy or self-government can consist of sharing with one's fellow citizens political independence, or can consist of self-direction by that element of the self authorized by nature to rule (often identified with reason). To be self-governed requires that we not be governed by illegitimate outsiders and equally not by alien forces from within.

Note the close analogy to slavery. One slave owner, *A*, is very severe with his only slave, *S1*, permitting him only minimal free movement, no choice in deciding what his off-duty conduct shall be, or what he shall read, how he dresses and so on. Another slave-owner, *B*, is very easy-going. He treats his only slave, *S2*, as if he were a valued friend, and allows him to do anything short of harming others or leaving the plantation. It is clearly understood that *S2* may do all these things only because *B* permits him to, not as a matter of right. The only rights in this situation are *B*'s property rights. The rules of property ownership permit *B* to be as tough with *S2* as he wishes, but he prefers to be kind. So there is in *S2*'s situation a predominance of heteronomy (government by others) conjoined with high optionality (*de facto* freedom). It seems clear then that one can have little or no autonomy, and yet live a contented life with a high standard of living, something resembling friendship and respect, and most important - options left open for one's own choice to exercise, though not as a matter of right.

Suppose that in respect to a certain choice there are two possibilities left open for *S2*. His master can restore his autonomy and turn him loose into an unfriendly world where other human beings, even though they lack authority over him, treat him badly, effectively closing many key options that would have been left open for him by his earlier beneficent master. Should he accept this offer at the expense of much *de facto* freedom? If the question is a difficult one, it shows that it is not clear to which of the two contending values, independence or optionality, he attaches the greater importance (see Autonomy, ethical).

3 Negative and positive freedom

Philosophical advocates of 'positive freedom' are often reacting to a tradition among English empiricists that extends from Hobbes to J.S. Mill and Russell. Hobbes intended his definition to apply to the most essential of the common elements in free action and free movement generally. He defined 'free' as the absence of external impediments, to apply equally well, for example, to free-flowing (undammed) streams of water as to the purposeful conduct of human beings. Subsequent empiricists, including Locke (§10) and Hume (§3), also held that all freedom is essentially something negative; namely, the absence of restraint or impediment to our actions.

The family of theories to which Berlin attached the label 'positive liberty' are those that identify freedom (or liberty) with personal autonomy or self-government. One version of that theory emphasizes the internal forum that is the agent's self and the legitimate claim of the rational self to rule over the self's lesser elements. The second of the autonomy theories is less individualistic and more political. It holds that no individual can live their life autonomously except as a member of a free political community, a state that is not only independent of other states, but one that is itself organized democratically so that all citizens can share in its governance, and in that sense, at least, be self-governing.

The nineteenth-century idealist philosopher T.H. Green (§3) summed up these requirements in his definition of 'freedom' as a 'positive power or capacity of doing or enjoying something worth doing or enjoying, and that too, something that we do or enjoy in common with others' (1888: 371). Green's definition also expresses a second conception of positive freedom as more than the mere absence of impediment to our desires, even more than the absence of impediment to our 'worthy' desires. In addition to the absence of constraint, genuine freedom must provide full opportunity beyond the mere non-interference of the police and other people. If a person desires above all things to own and enjoy a Mercedes, and there are no external impediments, legal or nonlegal, in the community to such ownership, then both the legal code and the neighbours leave them free to do as they desire. But if that person has no money, then that negative freedom is effectively useless. To have true freedom, say

supporters of positive freedom, one must have what is required for the satisfaction of worthwhile wants, and that will usually include at least minimal wealth, physical health, talent and knowledge, including the sorts of knowledge normally imparted by formal education. The more we are able to do the things worth doing, they insist, the freer we are.

The positive freedom theorists may go on to charge that the negative theorist cannot explain why the laudatory title of freedom should ever characterize the person who is paralyzed, insane, infantile, impoverished and ignorant, as generally free. It must be ironic, they claim, to say that such an unfortunate person is well off in the manner implied by the term ‘free’. Negative freedom theorists argue that to be free does not mean to be well off; one may be free but discontented, unhappy, ignorant, hungry or in pain. An individual may have freedom but find that in their circumstances it is not worth much. What this shows is that freedom is the kind of good whose worth fluctuates, or in the words of John Rawls (§§1-2): ‘the worth of liberty is not the same for everyone’ (1971: 204).

The pauper is *unable* to buy the Mercedes, but according to the negative freedom advocate, this is not through being *unfree* to buy one. Most writers within the negative freedom tradition deny that all inabilities are also ‘unfreedoms’. The inabilities that constitute unfreedoms, they insist, are those that can be traced directly or indirectly to the deliberate actions or policies of other human beings, in particular legislators and police offers, who can intervene directly and forcefully in other persons’ lives. Sometimes the relevant explanation of some other person’s incapacity (for example, to earn a decent living) can be linked indirectly to various social influences. The impoverished person might be so because of a lack of technical skill, and that lack, in turn, could be a product of a poor education traceable, however obscurely, to the inequities of a national system of racial segregation, which in turn was supported as deliberate policy by an apartheid government. In that case we could say not only that they are unable to do *x*, but also that they are unfree, given the circumstances, to do so.

The gap between the positive and negative theorists can be further decreased by a theory which has a wider conception of ‘restraint’ and ‘impediment.’ Such a theory would have a place both for negative constraints like lack of money, and internal constraints like intense headaches. Such a theory could support negative freedom (that all freedom consists of the absence of impediments, whether positive, negative, internal or external), yet also encompass the important point made by positive freedom (that there is a lot more to freedom than simple non-interference from police officers and other persons, important as that is).

A large number of philosophers now reject the view that there are two irreducibly distinct concepts of freedom, one positive and the other negative (MacCallum 1967; Feinberg 1973; Rawls 1971). These ‘single concept’ theorists do not contend that one of the pair of allegedly distinct concepts is ‘the only, the "truest", or the "most worthwhile"’ (MacCallum 1967: 312), but rather that it is a mistake to make the distinction between positive and negative concepts in the first place. According to MacCallum, there is only one concept of liberty and that is best understood as ‘always one and the same triadic relation’ between a person (subject or agent), an intended action (actual or possible) and what MacCallum calls a ‘preventing condition’ (barriers, compulsions and constraints) (1967: 312, 314). Freedom, in his view, is always *of* someone, *from* something, *to* do, have or be something. Disputes about the nature of freedom like that which divided adherents of positive freedom from adherents of negative freedom are, according to MacCallum, really disagreements over the proper range of one or more of the three variables in a single analytic model: what the term ‘person’ is to stand for, what is to count as an obstacle, or impediment, or forceful interference, and what is to count as a wanted or intended action.

4 Freedom as optionality

Among the controversies that still divide writers about freedom is the question of whether freedom (in the sense of optionality alone) should be conceived of as simply the absence of present frustration or whether it is best understood as the absence of wider opportunities to do more than one wants to do now. We can call the former concept the ‘actual-want satisfaction’ theory and the latter the ‘hypothetical-want’ or ‘dispositional’ theory. The former allows a person to be called free to the extent that they can satisfy their present wants, without hindrance or frustration. The dispositional concept, however, will not consider them free unless they can also do things that they do not want to do at that present moment, but could, for all they now know, come to want to do at some future time. Why, one might ask, would added dispositional freedom be of value to the person whose actual wants are always permitted their satisfaction? Why should a person miss merely hypothetical want-satisfaction when they can do everything they want without frustration? The usual answer to this question points out that the love of

freedom can be a love of breathing space, or room to manoeuvre, of frequent opportunities to change one's mind. The hypothetical account of optionality, therefore, can also be called the 'breathing space' theory.

The most influential spokesmen for the 'actual-wants' concept were the ancient Stoics (see Stoicism §17). According to Stoic teaching, there are two ways a person can increase the degree of their want-satisfaction. One is to leave their wants as they are and work for the means to satisfy them. The second is to avoid trying to change the world - that is the path to misery - but instead to develop the techniques for changing desires so that they always accord with what happens. The Stoic does not need any breathing space. Whatever happens will please them because their only desire is that God's will be done, and since Zeus is believed to be omnipotent, that desire cannot be frustrated.

Consider Dorothy Doe, who can choose among 1,000 things at time *t*, but is prevented from choosing, or actually doing, the one thing she wants most to do. Richard Roe, on the other hand, can only do one thing at time *t*, but it happens to be the one thing he wants most to do. Richard Roe, one should say, is not simply 'comparatively' or 'largely' unfree; rather, he is totally unfree, for to say that he can do only one thing is to say that he is forced or made to do that thing. And it is beyond controversy that one cannot be both free and compelled to do the same thing. It may be the case, however, that Richard Roe will be entirely content with the arrangement, and actually welcome the compulsion, which if so, shows again that one can sometimes find more contentment in being unfree than in being free. This at least is the message derived from the example by the hypothetical-wants theorist. The actual-wants theorist will deny that Roe is truly unfree; after all, Roe *can* do what he most wants to do.

Dorothy Doe, on the other hand, may have just lost her last chance to pursue a career as a medical researcher, or her last chance to marry the man she loves, or to find a cure for her child's disease. But she does 'enjoy' thousands more options than Richard Roe. She might seem to be freer in respect (say) to prospective marriage partners (one hundred philosophers are eager to marry her tomorrow, but she loathes them all). But her greater freedom is of no significant use. She will be unhappier but more free than Roe. This example may please the breathing space theorist more than the actual-wants theorist, but it may give still more support to the value-oriented philosopher of freedom considered next.

Is Dorothy Doe really more free simply by having more open options? Does not the superior desirability, in her judgment, of some of the options count as well as the sheer number of them? The proponent of the hypothetical-wants theory of freedom often baulks at permitting desirability into our determinations, partly because of the danger that philosophers will reduce the issue to a purely normative question to be settled by considering which definition of the word 'free' links its meaning to something that is worthy of the value we associate with the word.

The problem of counting options remains a difficulty for all the above theories. Berlin had earlier written that 'the method for counting [possibilities] can never be more than impressionistic. Possibilities of action are not discrete entities like apples, which can be exhaustively enumerated' (1958: 130, footnote 1) But individuating possible actions is not the only problem for the philosopher who would apply quantitative measures to freedom's many dimensions, including comprehensiveness, fecundity, and diversity. And one does not exhaust the relevant possibilities by dividing all action into 'possible' and 'impossible.' There are also the component categories - difficult and easy, possible at great cost and possible at small cost, statistically probable and statistically improbable, multiple choices and either/or choices.

It is hard enough to deal with these problems of measurement, but they are almost equally difficult to evade, especially if we continue to speak of one individual or one society having more freedom than another. Moreover, if a philosopher maintains that both the number and the significance, importance or value of open options determines how free one is (and probably most philosophers take such a combination view), then the difficulties begin all over again when they leave off option-counting and begins option-evaluating.

Freedom of speech

Freedom of speech is one of the most widely accepted principles of modern political and social life. The three arguments most commonly offered in its defence are that it is essential for the pursuit of truth, that it is a fundamental constituent of democracy, and that it is a liberty crucial to human dignity and wellbeing. Its advocates also plead the dangers of allowing governments to control what may be said or heard. Yet there is also general agreement that speech should be subject to some limits. Most contemporary controversies about free speech concern those limits; some focus upon what should count as 'speech', others upon the harms that speech may cause.

1 Definitions

In discussions of free speech, 'speech' is typically given a meaning that is both more and less inclusive than in ordinary usage. It includes written as well as spoken words and it may include nonverbal forms of communication such as pictures, symbols and gestures. That is why the phrase 'freedom of expression' is sometimes preferred to 'freedom of speech'. On the other hand, certain forms of speech fall outside this privileged domain; despite involving speech, perjury and blackmail, for example, receive no privileged treatment.

The 'freedom' that is most commonly of concern is legal freedom - the absence of legal restraints upon speech. But other sorts of freedom may also be at issue, for example freedom from inhibiting social pressures or economic threats, such as loss of trade or employment. Questions of free speech can also arise in matters such as the editorial policy of an academic journal or the purchasing policy of a library. The reality of people's opportunities to air their views through the media is another important matter for free speech, particularly in contexts of economic inequality or government-controlled media and in relation to competitive speech such as political argument (see Freedom and liberty).

Freedom of speech is typically asserted as a 'right', which therefore has a privileged moral and political status, and it has become a standard ingredient of constitutional bills of rights and declarations of human rights. The right to unfettered speech is most commonly claimed for those who wish to *speak*, but it may also be claimed for those who wish to *hear* and the right to *hear* what others wish to say may be no less important.

Analysts sometimes try to give content to freedom of speech as a right by dissecting the meanings of 'speech' and 'freedom', but philosophically it is impossible to divorce the proper content of the right from its justification. Only when we have considered why freedom of speech matters are we in a position to identify what sort of speech the right should encompass, what sort of freedom it should imply, and what sort of status that freedom should enjoy.

2 Justifications

The pursuit of truth. Freedom of speech has been commonly defended as an instrument of truth. That was the claim central to Milton's *Areopagitica* (1644) and to Mill's *On Liberty* (1859) - the two most celebrated defences of free speech in the English language (see Mill, J.S. §12). If there is to be progress in knowledge and understanding, people must be free to present, criticize and discuss ideas and information. Only in such a free and open exchange will the truth have maximum opportunity to emerge. Once the truth has emerged, we might suppose that free speech has done its job and can be safely abandoned. But the fallibility of our beliefs has always figured strongly in this defence: we may believe that the opinion we suppress is false, but history shows how often truth has been mistaken for error and error for truth. Moreover, as Mill argued, even if an opinion is true, we can be confident of its truth only so long as it can withstand challenge, and even a true belief is liable to become a 'dead dogma' rather than a genuine conviction if immured from challenge.

Powerful though this defence is, it encounters a number of objections. First, it makes free speech valuable only in so far as truth is valuable. In general, we are unlikely to deny that truth is better than error and knowledge better than ignorance, but on occasion truth and knowledge may conflict with other goods such as public security and peace of mind. Some doubt whether truth should always be the overriding value.

Second, the argument supposes that free speech will actually foster truth and understanding. Sceptics find such a claim unduly optimistic and doubt the ability of ordinary people to distinguish truth from error and irrational

prejudice from sober reasoning. In assessing that objection, however, we must be alive to the alternatives. The relevant question is not whether truth will always emerge from the marketplace of ideas but whether it will be better served by open and unfettered discussion than by government censorship.

Third, some forms of expression, such as some types of art, are not concerned with truth and cannot therefore be defended as its instruments. On the other hand, in those cases there are often other goods, such as creativity, which can take the place of truth in a similarly structured consequentialist defence of free expression.

Democracy. The fundamental idea of democracy is that of a people governing itself. This cannot be done if the members of a people are unable to present their views to one another. Democratic decision making requires discussion and debate as well as voting, and a significant limit upon its deliberative process will significantly limit its democratic character. Moreover, democracy implies that no one is authorized to limit a people’s freedom of discussion, except perhaps the people itself. Democracy in ideal form also entails that each person who is subject to its decisions should be entitled to participate equally in its processes, and hence that each should enjoy equal rights of free expression (see Democracy).

Given the indirect character of modern democracy, freedom of speech is also important politically for ensuring that rulers are aware of the wishes and opinions of the ruled, for enabling the conduct of opposition and for preventing abuses of power. Indeed, as a check upon the abuse of power, the case for free speech extends beyond democratic forms of government.

Democracy is sometimes thought to afford an unsafe haven for free speech. Suppose a majority wishes to silence a minority; does democracy not then sanction the removal of that minority’s freedom of speech? The answer depends in part on what sort of speech is at issue. Since democracy requires that all members of a demos should enjoy equal political rights, democracy itself cannot justify a majority’s removing or reducing the democratic rights - including democratic rights of free expression - of some members of the demos. However, the speech that can be defended by appealing to democracy is limited to that which is essential to participation in a democratic process. That does not encompass every form of speech. For example, if we wish to defend the right of scientists to challenge the orthodoxies of their peers, the prerequisites of democratic participation do not provide the most convincing foundations for that right - although it is not possible to state in a simple a priori fashion what sorts of speech will be relevant to a democratic process and what will not.

Individual liberty. Free speech is often valued as a constituent of individual liberty rather than only as an instrument of social purposes or as a specifically political institution. Sometimes what is emphasized is the moral standing of persons. To prevent people from communicating their beliefs and opinions is to violate the respect and standing to which they are entitled as persons. Equally, not allowing them to hear the views of others and to reach their own conclusions is inconsistent with their moral status as persons. Sometimes the emphasis shifts from the ’rightness’ to the ’goodness’ of free speech. The ability to communicate freely with one’s fellows, it is claimed, is essential to human development and human fulfilment. Free speech is a crucial feature of a society whose institutions and ethos enable individuals to shape their lives, to exercise meaningful choices and to achieve wellbeing in its fullest human sense.

3 Limits

Nowadays, controversy over free speech centres mainly upon its limits. Debates about those limits focus on two matters: the scope of speech and the harms that might be wrought by speech.

What some seek to protect as speech, others deny is speech in any credible sense. For example, attempts to incorporate pornographic displays within the free speech principle have met with the objection that those displays have no communicative content and are not speech in any reasonable sense (see Pornography). In addition, some of what would ordinarily be termed speech may not qualify as speech of a privileged kind. Advertisers, for instance, are engaged in intentional communication but arguably justifications of free speech provide no case for including commercial advertising in the category of privileged speech. Equally, there are acts, such as flag-burning or wearing a symbolic armband, which would not ordinarily be described as speech but which may be encompassed by the free speech principle because of their expressive or communicative character. In some measure, then, the limits of free speech are set by what its justifications imply should count as speech.

Second, speech is often limited because it proves harmful. It is sometimes held that speech, because it is speech and not action, cannot harm; but that is clearly not so. Defamation damages a person's reputation and that harm is usually accepted as reason enough for proscribing libellous speech, provided that what is said is neither true nor 'fair comment'. Speech which invades privacy is also a candidate for proscription where no genuine public interest is at stake; here even 'truth' is no defence - there are some things that a public has no right to know. Other types of speech that are often outlawed because of their alleged harmfulness are obscenity and pornography, incitements to violence and other sorts of illegal conduct, and speech which incites hatred, particularly racial hatred.

Four types of controversy surround claims about the harmfulness of speech. One is the essentially empirical question of whether a particular form of speech actually causes the harm it is alleged to cause. Many people, for example, believe that pornographic material encourages sex crimes, while others claim it has no such effect and may even provide a catharsis which reduces criminality. A second issue is whether an alleged harm is really a harm. If a speaker incites others to overthrow a political system or to defy a law, is that harmful? Clearly, the answer will depend, in part, upon our estimate of the political system or the law at stake (see Law, limits of §4).

A third matter is whether an acknowledged harmful effect is sufficiently harmful to justify restricting speech. Should we, for instance, outlaw blasphemous statements so that people with religious convictions are spared offence? Given the weight of the free speech principle, a harm will have to be significant and substantial to justify curtailing speech. On the other hand, in making that assessment it is reasonable also to take into account the nature of the speech involved, even when it is speech whose subject falls within the privileged realm. For example, the case against prohibiting offensive religious statements will be less strong if those statements are merely scurrilous and aim only to cause distress than if they form part of a serious disquisition.

In most cases in which we restrict harmful speech, we are delimiting the right of free speech. For example, in accepting laws of libel we are accepting that people have no right to engage in defamatory speech. But there is a fourth area of debate concerning harm that is about overriding rather than defining the right of free speech. Suppose someone addresses a hostile audience; they say nothing they are not entitled to say but the audience starts to react violently; the authorities, anxious to prevent a riot and to protect life and limb, step in and silence the speaker. In these circumstances, we might accept that, all things considered, the authorities rightly silenced the speaker even though the speaker had committed no wrong. In such cases, we are not setting the boundaries of the right of free speech; rather we are accepting that there are circumstances in which the right may be justifiably overridden.

Not every wrong that is cited as a reason for limiting speech is readily described as a 'harm'. 'Indecency' and 'obscenity', for example, are sometimes condemned for reasons other than the injury they do to others. Generally, there is a reluctance nowadays to accept that statements should be prohibited merely because they are false. After all, fallibility and uncertainty about truth figure prominently in the case for free speech. One current and controversial exception is the Holocaust, denial of which is now outlawed in some countries. Even that measure, however, is often justified as a way of combating racism and of preventing affronts to victims of the Holocaust, rather than as a simple endeavour to uphold truth by law.

Not all rules which govern speech should be conceived as restricting it. For example, orderly discussion of issues in a legislature requires rules of debate and, taken in the round, those rules regulate rather than restrict speech. Similarly, there is a difference (although one that is often controversial) between regulating and restricting street demonstrations.

In all cases in which speech is limited, determining where precisely the boundary should fall can prove difficult. Legislators and judges need precise distinctions between the tolerable and intolerable, yet general philosophical arguments often fail to supply those sharp distinctions. In addition, debates about the moral limits of free speech need not be wholly identical with debates about its proper legal limits. Because there is reason to fear political power and the clumsiness of law, the legal right of free speech may be cast more generously than the moral right. Thus, morally, there may be things that we ought not to say, even though, legally, we are and ought to be free to say them.

Freedom, divine

In the theistic tradition, many thinkers have held that God is infinitely powerful, all-knowing, perfectly good and perfectly free. But since a perfectly good being would invariably follow the best course of action, what can be meant when it is said that God acts freely? Two different views of divine freedom have emerged. According to the first view, God acts freely provided nothing outside him determines him to act. So when we consider God's action of creating a world, it is clear that on the first view he acts freely since there is nothing outside him to determine him to do as he does. The difficulty with this view is that it neglects the possibility that God's own nature might require him to create one particular world rather than another or none at all. According to the second view, God is free in an action provided it was within his power not to perform that action. Unlike the first view, on this view God acts freely only if nothing beyond God's control necessitates his performing that action. The problem for this view is that since it is impossible for God, being perfectly good, not to choose to follow the best course of action, it is difficult to see how God could be free in such an action.

1 Two views of God's freedom

In traditional theism, God is understood to be an omnipotent, omniscient, perfectly good creator of all things other than himself. But what of divine freedom? Is the God of traditional theism also free with respect to creating things other than himself? If God were not free not to create what he does create then it seems we could make no sense of thanking him or praising him for creating what he did. He would not merit our gratitude and praise for the simple reason that he would create of necessity and not freely. So in addition to his other attributes, traditional theism has insisted on ascribing freedom to God (see God, concepts of §6).

How are we to understand divine freedom? Two different views have emerged. According to the first view, God is free in creating a world or in acting within the world he has created provided nothing outside him determines him to create the world he creates or determines him to act in a particular way in the world he has created. According to the second view, God is free in creating or acting within his creation provided it was in his power not to create what he did or not to act within his creation as he did.

How are these two views of divine freedom connected? If it was in God's power not to create the world he did create, then there was nothing outside God that absolutely determined him to create the world he did create. So God's having the power not to create what he did create implies the absence of something outside him that absolutely determined him to create what he did. But the reverse is not true. The absence of something outside a being that determines that being to act in a certain way does not imply that the being has the power not to act in that way. For something within that being may absolutely determine it to act in a certain way. And if something within a being necessitates that it act in a certain way, then, unless the presence or absence of that necessitating factor is within the being's control, that being lacks the power not to act in that way.

2 The first view and its chief difficulty

The first of these two views has the advantage of establishing beyond question that God possesses freedom from external forces with respect to his selection of a world to create. For given that he is omnipotent and the creator of all things other than himself, it is evident that nothing outside him determines him to create whatever he does create. And given that whatever he creates is within his control, it would seem that he is completely at liberty to act as he sees fit within the world he has created. So the fact that nothing outside God determines him to create or act as he does clearly shows that God is an autonomous agent; he is self-determining in the sense that his actions are the result of decisions determined only by his own nature. But is this sufficient to establish that God is genuinely free? We believe that a human being need not be free in performing a certain action even when it is clear that they were not determined to perform that action by external forces. Perhaps the person was in the grip of some internal passion or irresistible impulse that necessitated the performance of that action, overcoming their judgment that the action is wrong or unwise. With respect to human beings, the defender of the first view of divine freedom can agree that the mere absence of determining external agents or forces is not sufficient for an individual's action to be free. But in the case of God, as opposed to humans, the defender can argue that it is sufficient. For in God there is no possibility of his passions overcoming the judgment of reason. As Leibniz remarks:

> The Stoics said that only the wise man is free; and one's mind is indeed not free when it is possessed by a great passion, for then one cannot will as one should, i.e. with proper deliberation. It is in that way that God alone is perfectly free, and the created minds are free only in proportion as they are above passion.
>
> (1704: 175)

The chief objection to this view of divine freedom is that it does not sufficiently recognize the importance of agents having control over their free acts. An action that an agent performs freely is an action the agent was free to perform and free not to perform; it was up to the agent whether to perform or not perform that act. If some external force or internal passion was beyond the control of the agent, and the agent's action was inevitable given that external force or internal passion, then the agent did not act freely in performing that action. Since God is a purely rational being and not subject to uncontrollable passions, which sometimes compel human agents to act, it is tempting to conclude that God enjoys perfect freedom of action. But this will be so only if there are no other features in God that both necessitate his actions and are not within his control. Because human beings are generally thought to have the power to act against the counsel of reason, we regard their acts due to reason - as opposed to their acts due to irresistible impulses - as acts they perform freely. For we believe they were free to reject the counsel of reason and act otherwise. But what if God cannot reject the counsel of his reason as to what action to perform? A human being who is morally good and rational may yet have the power to refrain from acting as his goodness and reason direct. But can this be true of God? And if it cannot be, how can we then say that God acts freely? Thus, it has seemed to many philosophers and theologians that the first view of divine freedom fails to capture an essential element in the idea of freedom, whether human or divine.

3 The second view and its chief difficulty

The second view of divine freedom embraces the idea that agents, whether divine or human, act freely only if they have the power to refrain from so acting. Although the idea of 'power to refrain from so acting' is not particularly clear, the proponents of the second view are united in rejecting any conditional account such as 'power to refrain from so acting if the agent wills to refrain', for such an account does not require that it was in the agent's power to will to refrain. So, according to the second view, God was free in creating the world he did create only if it was unconditionally in his power either to create some other world instead or to refrain from creating any world at all.

The chief difficulty facing this second view of divine freedom arises when we consider some of God's other attributes and ask whether they leave God with any significant degree of freedom. It has already been noted that the theistic God is a being of infinite power and perfect goodness. These perfections are generally regarded as *essential* to God. They constitute part of his very nature. That being so, we can ask whether God is ever free to do an evil (morally wrong) act. The answer seems to be no. Of course, being perfectly good, omnipotent and omniscient, God will never in fact do an evil act. No being who knowingly and willingly performs an evil act is perfectly good. Since being free to do an evil act is consistent with never in fact doing an evil act, it may seem that God could be free to perform such an act. But if God is free to perform an evil act, then he has it in his power to perform that act. And if God has it in his power to perform an evil act, then he has it in his power to deprive himself of one of his essential attributes (perfect goodness), to change his nature. But no being has the power to deprive itself of one of its essential attributes. Therefore, it would seem that God does not have it in his power to perform an evil act (see Goodness, perfect §2).

The fact that God cannot do evil does not severely limit God's freedom so long as there remains a sufficient range of actions that are open to God. For example, it has long been held that God's action in creating the world was a free action, that God was free to create a world and free not to create a world. Moreover, it has been held that among worlds God can create, God is free to select the one he will create. Of course, since he cannot do what is evil he cannot create a bad world. But presumably there are many good worlds from which he is free to select the one he wishes to create. Even here, however, there are serious problems in reconciling God's freedom with his omnipotence, omniscience and perfect goodness.

Suppose among creatable worlds there is one that is better than all others. Is God free to create some world other than this best world? If God creates some world that is less than the best world he can create, it would seem to be possible for there to be a being better than God. For it is the nature of perfect goodness to create the best it can.

Therefore, since God is perfectly good, a being whose goodness is unsurpassable, it follows that if there is a unique best world among worlds he can create, it is impossible for him to create a world inferior to it. For then he would not be a being whose goodness is unsurpassable (see Quinn 1982).

What if there is no best world among creatable worlds? This could be true in two ways. First, it might be that for any creatable world there is a better world God could create. Second, it might be that there is no unique best world. Perhaps instead there are many equally best worlds among the worlds God can create. Let us consider these two cases in turn.

On the assumption that for any world God might create there is a better world he could create instead, it is clear that it is impossible for God to do the best that he can. Whatever he does, he could have done better. This being so, it seems only reasonable that God's perfect goodness would be fully satisfied should he create a very good world. Presumably there are a large number of such worlds from which he can choose one to create. So long as he creates one of these worlds it seems he will have satisfied the demands of his perfect nature. For the idea that he should create the best world he can is an idea that logically cannot be realized. Hence, on the assumption that there is no best world among the worlds God can create, it would seem that God's perfect goodness is fully compatible with his freely creating any one of a number of good worlds that lie in his power to create. To complain that God cannot then be perfect because he could have created a better world is to raise a complaint that no creative action God took would have enabled him to avoid. Thus it appears that if for any creatable world there is a better creatable world, God would be free to select among an infinite number of good worlds to create. (Thomas Aquinas, for example, thought that no matter what world God created he could have created a better world in the sense of a world with a greater amount of good in it.) But the difficulty with this position is that it conflicts with the principle that if a being creates a world when there is a better world that it could have created, then it is possible that there be a being better than it. For it would be possible that there be a being whose degree of goodness is such that it would choose to create a better world. So if for every creatable world there is a better creatable world, it is not clear that the traditional theistic God could be perfectly good and be the creator of a world (see Rowe 1993).

Let us now consider the second way in which it could be true that no creatable world is better than all others. Suppose that among the worlds God can create there are a number of worlds that are equally best. It is plausible to think that if a perfectly good being creates a world, he cannot create a world that is inferior to some other that he can create, at least provided that there is a world than which none is better. Therefore, if there are a number of equally best worlds among the worlds he can create, then if he creates at all he must create one of those worlds. But unlike the case when there is exactly one best world among the worlds he can create, here some degree of divine freedom can exist in harmony with God's perfect goodness. For God would seem to be free to create any one of the equally best worlds. In any case, God's absolute perfection imposes no requirement on his creation from among those equally best worlds.

Is God free not to create a world at all? Here we may limit our inquiry to the possibility that there is exactly one best world among the worlds creatable by an omnipotent being. As we have seen, in this case there is some reason to think that God is not free to select any other world to create. Our present question is whether in this situation God is free not to create at all.

What world would be actual if God exists but does not create at all? Apart from God and whatever necessarily existing entities there are, in a world God inhabits but does not create, no other being would exist. To answer our question of whether God is free not to create a world at all, we must compare the best world God can create with a world whose inhabitants are simply God and whatever necessarily existing entities there are. Assuming such a world would not be incommensurate with the best among worlds God can create, there is reason to think that God is not free with respect to whether he will not create at all. For either the world he inhabits but does not create is better than the best world he can create or it is not. If it is better, then he is not free to create a world, and thus necessarily refrains from creating. If it is worse, then he is not free not to create a world, and thus necessarily creates a world. For it is plausible to hold that if a being can but does not create a world that is better than the one it merely inhabits, then it is possible that there be a being better than it. Would the world he inhabits but does not create be just as good as the best world among those an omnipotent being can create? If so, then, as in the case where there are a number of equally best worlds omnipotence can create, we again have room for some degree of divine freedom. But in this situation, God's freedom would be restricted to creating the best world or not creating

at all.

4 Possible solutions to the difficulties

The difficulty with the first view of divine freedom is that it fails to satisfy our basic conviction that a free action requires the freedom to have done otherwise. Once we see that God's nature would necessitate his action of creating the best of all creatable worlds, the failure to satisfy this basic conviction becomes apparent. The proponent of the first view may try to solve this difficulty by arguing that the intention behind emphasizing the freedom to have done otherwise is not to exclude all necessitating factors, only those for which the agent bears no responsibility. If by freely engaging in strenuous moral effort Mahatma Gandhi developed his moral nature to such a degree that in certain situations he was not capable of acting unkindly towards others, we would still view his acts of kindness as free in a derivative sense since the virtuous nature now necessitating his acts of kindness was itself brought about, at least in part, by his own free moral striving. The difficulty with this suggestion, however, is that God's properties of omnipotence, perfect goodness, and omniscience are not properties he acquired by any kind of striving. In fact, he did not acquire them at all, but had them from all eternity. Thus it seems that although we may describe God as perfectly free in the sense that his actions are never determined by agents or factors outside him, this perfect freedom does not by itself ensure that his actions are free in the sense required if he is to be thanked and praised for performing those actions.

The chief difficulty confronting the second view of God's freedom is that his attributes of omnipotence, omniscience and perfect goodness appear to impose significant restrictions on his freedom in creating a world and in acting within the world he creates. As we saw, it seems that it is not in God's power to do evil or to create less than the best that he can create. Proponents of the second view have tried to solve this problem by distinguishing the necessity imposed on his actions by God's absolute perfections from the sort of necessity that deprives an agent of the power to act otherwise. While admitting that the inflamed passions may causally necessitate an agent's action, thus depriving the agent of the power to do otherwise, some proponents of the second view hold that rational motives are not causes at all. In their view, rational motives do not deprive the agent of the power to act against their counsel. On the other hand, God's essential attributes of omnipotence and perfect goodness make it truly impossible that God should fail to follow what he sees to be the best course of action. How, then, can God be free in carrying out what he sees to be the best course of action? How can the fact that he cannot do other than choose the best not be seen as a limit on his freedom? The answer traditionally given is that power extends only to what is logically possible. A being who is essentially omnipotent and perfectly good cannot possibly fail to choose the best course of action. But this implies no lack of power, for power is lacking only when an agent cannot do what is possible to be done. Thus Samuel Clarke (§1) concludes his discussion of divine freedom by remarking:

> It is no diminution of power not to be able to do things which are no object of power. And it is in like manner no diminution either of power or liberty to have such a perfect and unalterable rectitude of will as never possibly to choose to do anything inconsistent with that rectitude.
>
> ([1706] 1738: 122)

The solution proposed by Clarke and others is promising. That it is not within God's power to weaken himself does not mean that his power is less than infinite. For it is logically impossible that an essentially omnipotent being should weaken itself. Hence, since power extends only to what is possible, the fact that it is not within God's power to weaken himself does not imply any diminution of power. And perhaps the same can be said for it not being within God's power to refrain from following what he sees as the best course of action. This too may not imply any diminution of power. But for God to act freely in following the best course of action it must be within his power not so to act. The fact that it is not within his power not so to act may not imply any diminution of power, but it remains unclear why it does not imply a diminution of freedom.

Frege, Gottlob (1848-1925)

A German philosopher-mathematician, Gottlob Frege was primarily interested in understanding both the nature of mathematical truths and the means whereby they are ultimately to be justified. In general, he held that what justifies mathematical statements is reason alone; their justification proceeds without the benefit or need of either perceptual information or the deliverances of any faculty of intuition.

To give this view substance, Frege had to articulate an experience- and intuition-independent conception of reason. In 1879, with extreme clarity, rigour and technical brilliance, he first presented his conception of rational justification. In effect, it constitutes perhaps the greatest single contribution to logic ever made and it was, in any event, the most important advance since Aristotle. For the first time, a deep analysis was possible of deductive inferences involving sentences containing multiply embedded expressions of generality (such as 'Everyone loves someone'). Furthermore, he presented a logical system within which such arguments could be perspicuously represented: this was the most significant development in our understanding of axiomatic systems since Euclid.

Frege's goal was to show that most of mathematics could be reduced to logic, in the sense that the full content of all mathematical truths could be expressed using only logical notions and that the truths so expressed could be deduced from logical first principles using only logical means of inference. In this task, Frege is widely thought to have failed, but the attempted execution of his project was not in vain: for Frege did show how the axioms of arithmetic can be derived, using only logical resources, from a single principle which some have argued is, if not a logical principle, still appropriately fundamental. In addition, Frege contributed importantly to the philosophy of mathematics through his trenchant critiques of alternative conceptions of mathematics, in particular those advanced by John Stuart Mill and Immanuel Kant, and through his sustained inquiry into the nature of number and, more generally, of abstract objects.

In the course of offering an analysis of deductive argument, Frege was led to probe beneath the surface form of sentences to an underlying structure by virtue of which the cogency of inferences obtains. As a consequence of his explorations, Frege came to offer the first non-trivial and remotely plausible account of the functioning of language. Many of his specific theses about language - for instance, that understanding a linguistic expression does not consist merely of knowing which object it refers to - are acknowledged as of fundamental importance even by those who reject them.

More generally, three features of Frege's approach to philosophical problems have shaped the concerns and methods of analytic philosophy, one of the twentieth century's dominant traditions. First, Frege translates central philosophical problems into problems about language: for example, faced with the epistemological question of how we are able to have knowledge of objects which we can neither observe nor intuit, such as numbers, Frege replaces it with the question of how we are able to talk about those objects using language and, once the question is so put, avenues of exploration previously invisible come to seem plausible and even natural. Second, Frege's focus on language is governed by the principle that it is the operation of sentences that is explanatorily primary: the explanation of the functioning of all parts of speech is to be in terms of their contribution to the meanings of full sentences in which they occur. Finally, Frege insists that we not confuse such explanations with psychological accounts of the mental states of speakers: inquiry into the nature of the link between language and the world, on the one hand, and language and thought, on the other, must not concern itself with unshareable aspects of individual experience.

These three guiding ideas - lingua-centrism, the primacy of the sentence, and anti-psychologism - exercised a commanding influence on early analytic philosophers, such as Wittgenstein, Russell and Carnap. Through them, these ideas have been spread far and wide, and they have come to create and shape analytic philosophy, with whose fathering Frege, more than anyone else, must be credited.

1 Life and work

Gottlob Frege, a German philosopher and mathematician, is the father of modern logic and one of the founding figures of analytic philosophy. Trained as an algebraic geometer, he spent his professional life at the University of Jena, where, because his views about logic, mathematics and language were generally at odds with the dominant

trends of the time, he laboured independently on his central philosophical project.

Frege's main work consists of his *Begriffsschrift (Conceptual Notation)* (1879), in which he first presents his logic; *Die Grundlagen der Arithmetik (The Foundations of Arithmetic)* (1884), in which he outlines the strategy he is going to employ in reducing arithmetic to logic and then goes on to provide the reduction with a philosophical rationale and justification; *Grundgesetze der Arithmetik (Basic Laws of Arithmetic)* (volumes 1, 1893, and 2, 1903), in which he seeks to carry out the programme in detail (a planned third volume was aborted following Bertrand Russell's communication to Frege in 1902 of his discovery of paradox in Frege's logic); and a series of philosophical essays on language, the most important of which are *Funktion und Begriff (*'Function and Concept'*)* (1891), 'Über Sinn und Bedeutung' ('On Sense and Reference') (1892a), 'Über Begriff und Gegenstand' ('On Concept and Object') (1892b) and 'Der Gedanke: eine logische Untersuchung' ('Thoughts') (1918).

In general, Frege was not philosophically intrigued by what was specific to the human condition; for instance, he sought neither to probe the nature and limits of human knowledge nor to understand how humans actually reason. Yet he pursued his non-parochial philosophical interests by attending carefully to natural language and to the way it serves to express our thoughts. Frege's approach, in conjunction with his powerful tool of linguistic analysis (logic) and the collection of subtle, innovative and interwoven theses about language which he elaborated, spurred in others not only an intense interest in language as an object of inquiry but also adherence to a distinctive methodology which has come to characterize much analytic philosophy past and present.

2 Language and ontology

Frege's short book *Begriffsschrift* revolutionized the study of deductive inference. In the course of explaining how his 'conceptual notation' relates to natural language, Frege illuminates important features of language's underlying structure. He recognized that traditional grammatical categories have no logical significance and he urged the consideration instead of the categories of 'singular terms' (which he calls 'proper names') and of 'predicates' (which he calls 'concept-words'). For Frege, a singular term is a complete expression, one which contains no gaps into which another expression may be placed; for example, 'Virginia Woolf', 'the third planet from the Sun' and 'the largest prime number' are all singular terms according to Frege.

By contrast, a predicate such as '( ) was written by Virginia Woolf' is something incomplete; it is a linguistic expression which contains a gap and which becomes a sentence once this gap is filled by a singular term. (The parentheses are not part of the predicate but are intended only to indicate the location of the gap.) Thus, if we fill the gap with 'the third planet from the Sun', we get a complete sentence. This example shows that the resulting sentence may be false or perhaps even nonsense; what is important is that a complete sentence does result. Other examples of predicates are 'Leonard Woolf married ( )', '( ) orbits Jupiter' and '( ) is an even prime number greater than two'; there are infinitely many predicates in any natural language.

Frege distinguishes more finely between predicates, depending on how many gaps they contain and on the types of linguistic expressions that can fill them. The predicates we have so far considered each have just one gap and are known as 'one-place' predicates. '( ) is the mother of ( )' is an example of a 'two-place' predicate, for it contains two gaps, each to be filled by a singular term. Predicates whose gaps are to be filled by one or more singular terms, as is the case with all those mentioned so far, are said to be 'first-level'. Predicates whose gaps are to be filled by first-level predicates are said to be 'second-level', and so on. For example, when properly analysed, 'All [ ] are mammals' is seen to be a second-level predicate: its structure is really 'Everything is such that if it [ ], then it is a mammal', which makes it plainer that the gap is to be filled by a predicate of first-level. (We use square brackets to distinguish such gaps, which must be filled by first-level predicates, from those occurring in first-level predicates, which must be filled by singular terms.) And, for Frege, 'There is at least one thing which [ ]' is likewise a second-level predicate: as we shall see in a moment, this corresponds to his view that existence is not a concept that applies to objects but rather to concepts. This finer classification will not be discussed further here. Nor will the issue of how precisely to understand the incompleteness of predicates, and the corresponding completeness of singular terms, a question that continues to be debated.

The following two points, however, are not in dispute: first, Frege discerns in the categories of reality counterparts to the linguistic categories of singular term and predicate; he calls these ontological categories 'object' and 'concept', respectively. Second, Frege understands concepts on the model of functions as they are commonly

encountered in mathematics.

A singular term refers to, or designates, an object. A predicate refers to, or designates, a concept. (We shall use ‘designate’ and ‘refer’ and their cognates interchangeably; in some discussions of Frege, ‘denote’ and ‘mean’ are also used.) Corresponding to the fact that a first-level predicate yields a complete sentence upon its gap being filled by a singular term, we have the fact that a first-level concept is true or false of an object - or, as Frege puts it, that an object ‘falls under’ or fails to fall under a concept. For this reason, Frege calls concepts ‘unsaturated’: unlike objects, they await completion, whereupon they yield one of the two truth-values, which Frege takes to be objects: the True and the False (1891: 6). For example, the concept designated by ‘( ) is an Oxonian’ yields the value the False when completed with the object designated by ‘Gottlob Frege’ and the value the True when completed with the object designated by ‘John Locke’.

Concepts are incomplete in the way that functions in mathematics are. For example, the function designated by ‘ 2+ ( )’ yields the value 8 when completed with the object 6, or, as we might more simply say, it yields that value for the argument 6. The function ‘ 2+ ( )’ is not an object, but yields one upon completion by an argument. On Frege’s view, concepts are a kind of function, namely those that take as their only values the True or the False.

In describing this congruence of linguistic and ontological categories, Frege is not confusing use and mention (see Use/mention distinction and quotation); indeed, Frege exhibited an understanding of the distinction between words and what they designate not witnessed again until well into the twentieth century. Though linguistic expressions are claimed to slot into a certain set of categories and reality into another, an intimate connection obviously exists between the two categorial schemes. Whether Frege takes the linguistic scheme or instead the ontological one as fundamental is a subject of debate and bound up with the question of whether and in what sense Frege sees philosophical reflection on language as the foundation of philosophy.

Regardless of this debate’s resolution, we know that Frege takes the categories of concept and object to be fundamental ontologically, ones not amenable to further analysis. In addition, basic structural features of language raise insurmountable obstacles to expressing certain truths about these categories. This can be demonstrated by considering the obvious claim (1) seeks to articulate:

(1) The concept designated by ‘( ) is a horse’ is a concept.

This seems patently correct. Yet Frege recognizes in ‘On Concept and Object’ (1892b) that we must judge (1) to be false. This is because the expression ‘The concept designated by "( ) is a horse"’ is a singular term and hence refers to an object, not to a concept. (The expression does not contain a gap, though it does mention one.) So (1) does not succeed in expressing what we intended. To do this, we need to fill the gap in ‘( ) is a concept’ by an expression that refers to a concept. But the straightforward way of doing this yields (2):

(2) ( ) is a horse is a concept,

which is not even a sentence. In trying to articulate our thought, we are led either to falsity or to something that makes no claim at all. This ‘awkwardness of language’, as Frege calls it, has been the subject of much controversy, but it seems clear that Frege draws the lesson that there are elemental facts about language and the world that perforce escape expression (1892b: 196).

3 Sense and reference

How do what words refer to (concepts and objects) relate to our understanding of language? In his seminal essay ‘On Sense and Reference’ (1892a), Frege considered whether the ‘sense’ of an expression - what it is that we know when we understand the expression - is simply identical to what it designates (the ‘reference’). Frege offers the following argument, as famous as it is simple, to show that our understanding of singular terms cannot consist just of knowing their reference:

(3) (a) If two singular terms *t* and *t*′ have the same sense and *C* is any (first-level) predicate, then *C*(*t*) has the same sense as *C*(*t*′).
(b) ‘The evening star = the morning star’ does not have the same sense as ‘The evening star = the evening star’.
(c) ‘The evening star’ does not have the same sense as ‘the morning star’.
[This follows from (a) and (b): let *C* in (a) be ‘The evening star = ( )’.]

(d) ‘The evening star’ refers to the same object as ‘the morning star’.
(e) The reference of ‘the evening star’ is not identical with its sense.
[This follows from (c) and (d).]

So the sense of an expression - that which must be known in order for a speaker to understand it - cannot be identified with its reference (see Sense and reference). (A terminological digression: in this essay of 1892, Frege used the words ‘*Sinn*’ and ‘*Bedeutung*’, respectively. There is, however, no consensus on how these should be rendered in English. More importantly, there is not yet agreement about how precisely to understand these notions and how they are related to more everyday notions, such as meaning.)

Frege’s justification for premise (a) relies on a ‘compositionality thesis’: the sense of a sentence is determined by the senses of its components (and by the way in which the sentence is constructed from them; see Compositionality). Premise (b) is justified by noting that an alert speaker would find the one sentence obvious, but not the other: ‘The evening star = the evening star’ is an uninformative statement of self-identity, whereas ‘The evening star = the morning star’ may impart hitherto unsuspected information. This difference in what Frege called ‘cognitive value’ suffices, according to him, to register distinct senses (1892a: 25). Finally, premise (d) follows from the observation that both singular terms designate the planet Venus, an astronomical discovery that was not made for some time.

If sense is not reference, then what is it? To this, Frege provides no clear answer. He writes that the sense of an expression is ‘the mode of presentation of that which is designated’ (1892a: 26), but he does not offer any elaboration regarding the nature of these modes (see Proper names §1). Frege does, however, advance a number of other theses concerning the relation between sense and reference. In the first place, the sense of an expression determines the identity of its reference, but not vice versa. For instance, the expression ‘the author of *Begriffsschrift*’ designates a particular individual, Frege, and any expression with the same sense designates the same individual; yet the expression ‘the author of *Die Grundlagen der Arithmetik*’, which also refers to Frege, has a different sense. Likewise, though ‘George Orwell’ and ‘Eric Blair’ both designate the same person (they have the same reference), the two singular terms have distinct senses.

Second, expressions can be formed which, while possessing a sense, lack a reference. For example, ‘Sherlock Holmes’ is a singular term that has a sense but lacks a reference, for Holmes does not exist. This is not in conflict with saying that sense determines reference, for what this means is that if two expressions have the same sense, then they have the same reference. One might wonder, though, whether this thesis is at odds with Frege’s description of sense as the way ‘that which is designated’ is presented: how can there be such a way when that which is designated, the reference, does not exist? (See Evans 1981.)

Many have found in the distinction between sense and reference relief from the philosophical distress that follows upon assuming, first, that we understand an expression by directly associating a reference with it and, second, that we understand expressions that fail to refer. Holding both of these assumptions has led philosophers to extravagant claims about the reality that is actually designated by our expressions, for instance that Holmes must exist in some fashion if we are to speak of him intelligibly (if only to deny his existence). Frege’s distinction between sense and reference, and his thesis that an expression can have a sense while lacking a reference, simply dissolves the problem by rejecting the first assumption (see Descriptions §1).

The argument (3) concerns singular terms, but Frege believed that other kinds of expressions have sense and reference. The distinction can also be drawn in the case of predicates:

(4) Something is a bottle of claret if and only if it is a bottle of claret.
(5) Something is a bottle of claret if and only if it is a bottle of Hume’s favourite wine.

(4) does not have the same sense as (5): no one would deny the first, but the second might come as something of a gastronomic discovery. Though ‘( ) is a bottle of claret’ and ‘( ) is a bottle of Hume’s favourite wine’ are predicates that refer to the same concept, they have different senses. (Frege identifies two concepts if an object falls under the one if and only if it falls under the other.)

What is the reference of a whole sentence? Frege answers this by observing what remains unchanged about a sentence when we substitute coreferring expressions (that is, expressions that have the same reference) in it.

Assuming a compositionality thesis for reference (that the reference of a sentence is determined by the reference of its components), we then have some reason to take whatever remains unchanged to be the sentence's reference. Consider (6) and (7):

(6) George Orwell wrote *1984*.
(7) Eric Blair wrote *1984*.

What remains unchanged? Not the 'thought' expressed by each sentence: someone might believe one sentence to be true, but not the other. Rather, it is the truth-value of the sentences that is constant: (6) and (7) are either both true or both false. This leads Frege to identify the reference of a sentence with its truth-value; a sentence refers to one of the two truth-values. Frege takes the two truth-values to be objects and he observes that on his view all true (false) sentences are really singular terms that refer to the same object, the True (the False).

Because the sciences are interested in what is true, we can see why Frege holds that reference 'is thus shown at every point to be the essential thing for science' ([1892-5] 1979: 123). Natural language permits the formation of expressions that lack reference, and so Frege judged it unsuitable as a tool of rational inquiry. For this purpose, it was inferior to his *Begriffsschrift*, a formal language he designed with the intention that no expression without reference could be constructed in it.

Frege notes that if his thesis that the reference of a sentence is its truth-value is correct, then we would predict (again on the basis of the compositionality thesis for reference) that if a subordinate sentence is replaced by a coreferential one (which will have the same truth-value), the reference of the entire containing sentence (that is, its truth-value) will remain unchanged. For instance, consider:

(8) Ronald Reagan was elected President in 1984 and George Orwell wrote *1984*.
(9) Ronald Reagan was elected President in 1984 and Eric Blair wrote *1984*.

(8) and (9) have the same truth-value, as predicted if the reference of a sentence is its truth-value. But now consider:

(10) Stimpson believes that George Orwell wrote *1984*.
(11) Stimpson believes that Eric Blair wrote *1984*.

If Stimpson does not realize that George Orwell and Eric Blair are one and the same person, (10) and (11) might have different truth-values, that is, they might differ in reference. And yet one is obtained from the other merely through substitution of what, on Frege's hypothesis, are the coreferring sentences (6) and (7).

Frege defends his hypothesis by claiming that in certain contexts expressions refer not to their ordinary reference but rather to an 'indirect' reference (1892a: 28). And, he adds, the indirect reference of an expression is just its ordinary sense. Because 'Stimpson believes that ( ) wrote 1984' is just such a context and because 'George Orwell' has a different sense from 'Eric Blair' (and so, in this context, a different reference), the compositionality thesis for reference no longer forces us to the conclusion that (10) and (11) have the same truth-value. Frege's response inaugurated a long, fruitful and continuing debate about the nature of such linguistic contexts. (For further discussion, see Indirect discourse; Sense and reference §5; Propositional attitude statements.)

And what about the sense of a complete sentence? Given the compositionality thesis for sense, it will be preserved upon substitution of one expression in a sentence by another with identical sense. Frege says that such a substitution preserves the thought expressed by the sentence and he consequently identifies this thought with the sentence's sense. So, because 'to lie' has the same sense as 'to express something one believes to be false with the intention of deceiving', Frege would predict that the following two sentences express the same thought:

(12) Everyone has lied.
(13) Everyone has expressed something he believes to be false with the intention of deceiving.

And this prediction does seem to be borne out. But what precisely is the thought expressed by a sentence?

4 Thought and thinking

When one thinks the thought that lemons are sour, many different kinds of psychological events may transpire; certain memories, images or sensations may be triggered. These events, according to Frege, belong to the psychological world of the subject and, as such, are not fully shareable with others: much as one may try, one cannot experience what another does. It is a serious error, Frege says, to confuse such private events as may accompany our grasping of a thought with the thought that is grasped. One commits the sin of ‘psychologism’ if one does not sharply distinguish between the psychological process of thinking and the thoughts that are, as a consequence of this private activity, apprehended.

Thoughts then, in contrast to what Frege calls ‘ideas’, are fully shareable. When you and I grasp the sense of ‘Lemons are sour’, we arrive at the very same thought: there are not two different, related thoughts (as we might, for example, have two different mental images of lemons), but just the one that, through perhaps idiosyncratic and private paths, we both succeed in apprehending. And so it is in general with senses: they are not of the mental world, but objective in that different individuals can grasp them and associate them with their words. To stray from this perspective, according to Frege, is simply to abandon the view that communication is possible; that two speakers can understand a linguistic expression in the same way.

To grasp a thought is not to hold it true. For though one grasps a thought in the course of asserting it, it is no less grasped in the acts of assuming it to be true, wishing that it were true, commanding that it be made true, questioning whether it is true, and so on. These acts correspond to the different kinds of ‘force’ that may be attached to a thought. This is not quite Frege’s position, but it is an influential one closely related to his views (1892a: 38-9). It has been attractive to many students of language because it divides the daunting project of giving an explanation of linguistic understanding and use into two potentially more tractable components. The first task, the articulation of a ‘theory of sense’ or ‘theory of meaning’, is to explain how the sense of a sentence is determined by the senses of its parts. The second task, the articulation of a ‘theory of force’ (sometimes also called ‘pragmatics’), is to explain, taking for granted an account of the thoughts expressed by sentences, the different speech acts into which they may enter. For example, it falls to the theory of meaning to describe the content of ‘Lemurs are native to London’ and to show how that thought is determined by the senses of the sentence’s constituent components. It falls to the theory of force to discover what, beyond the apprehension of that thought, is involved in asking ‘Are lemurs native to London?’, in wishing ‘Oh, would that lemurs were native to London!’, and so on. Should the theory of force need to make reference to the mental states of agents, then it is not merely helpful to divide an account of linguistic understanding and use into these two components but, Frege would insist, essential if we are to keep psychology from intruding into an account of sense (see Pragmatics; Speech acts §1).

5 Objectivity and privacy

In the previous section, we saw that Frege insists on the objectivity of thoughts (and senses generally), intending by this that different speakers can attach the very same thoughts to their sentences. There is a second way in which Frege takes thoughts to be objective. To say that thoughts are shareable is compatible with saying that their existence and properties are dependent upon human activity. Frege’s view seems to be that thoughts are also objective in that they exist independently of human activity. Thoughts are not created or shaped by the process of thinking; they exist regardless of whether we have apprehended them, regardless of whether we shall ever apprehend them. Thoughts await our grasp in somewhat the way that physical objects await our observation, though the latter are located in space and time whereas thoughts are not.

These two kinds of objectivity, shareability and independence, are taken by Frege to apply to truth as well, which he considers a property of thoughts. There are not different properties - say, ‘true-for-you’ and ‘true-for-me’ - which are private unto individuals. There is just one property, being true, which some thoughts have and others lack. Furthermore, whether a thought possesses this property is in no way dependent upon our capacity to recognize that it does. A thought’s being true must be sharply distinguished from our believing it to be true or our being justified in taking it to be true. On Frege’s view, the truth of a thought is not dependent upon our beliefs, not even upon our beliefs in some ideal epistemic situation. Truth is one thing, our recognition of truth something else entirely. This position regarding the independence of truth, present throughout Frege’s writings, is a robust realist motif in his thought, the evaluation of which has occupied centre-stage of much contemporary philosophy of language (see Realism and antirealism §4).

Since on Frege’s view a sentence is true if and only if it refers to the value the True, his realism amounts to saying

that a sentence refers to what it does independently of our recognition of this fact. But a sentence refers to an object only via its sense (the thought it expresses), which is what determines its reference. And its sense is not something that it has independently of speakers (after all, an expression - like 'chat', for example - can have one sense in one language and another in another), but is associated with it through human activity. Putting all this together, we see that, according to Frege, humans associate senses with linguistic expressions - this is what their understanding of language consists of - on account of which those expressions take on references whose identity may remain forever unknown.

That such a realism should follow from the senses attached to expressions forces our attention not only to Frege's notion of sense but, relatedly, to his conception of what it is to grasp a sense and associate it with an expression. Frege's anti-psychologism with regard to sense is not extended by him to an account of the grasping of sense, for in his few remarks about the subject he appears to avow a psychological picture of the process of apprehending a thought, of judging it to be true and so on (see [1897a] 1979: 145). Given his view of the privacy of mental events, it might seem that for Frege one cannot always determine which thought another has associated with a sentence: not that one cannot apprehend the same thought as another (for one feature of the objectivity of thoughts, that they can be grasped by all alike, guarantees that one can); but that one cannot always ascertain that one has.

That a speaker's linguistic understanding might remain private is a view that has troubled many, especially those influenced by the work of Ludwig Wittgenstein (see Private language argument). Michael Dummett, the most influential interpreter of Frege's philosophy (see Dummett 1973), argues that, while much remains of lasting value in Frege's views on language, they should be modified in such a way that not only must senses be graspable by all, something on which Frege already insists, but the attachment of senses to expressions must be accessible as well; that is, the nature of a speaker's linguistic understanding must be a thoroughly public affair (see Private states and language). Once these modifications are made, Dummett claims, important consequences will follow about which senses can be coherently grasped: if the only intelligible senses are those the grasp of which is subject to public inspection, then we must be sceptical of any analysis of linguistic understanding in terms of senses that underwrite realism and we should instead consider seriously analyses employing senses that do not countenance the possibility of sentences being true independently of all potential human knowledge. Both Dummett's argument and his assumptions have been disputed, and the controversy continues to be a lively one. This is not an issue about which Frege explicitly said much, but it is among the many deep debates on the nature of language and thought which his work has made possible.

6 Contributions to logic

Infamous for using a notation difficult to learn to read, Frege's *Begriffsschrift* is one of the greatest logical works ever written. (Its full title in English is *Conceptual Notation: a Formula Language, Modelled Upon That of Arithmetic, for Pure Thought*.) It contains a number of major innovations, two of which are of foundational importance for contemporary logic: a satisfactory logical treatment of generality and the development of the first formal system. *Begriffsschrift* also introduces (what are essentially) truth tables, contains Frege's definition of the ancestral (§9) and sows the seeds of his philosophy of language (§§2-5).

Let us first discuss Frege's treatment of generality, that is, his logical analysis of sentences containing such words as 'everything', 'something', 'no one' and the like. The foundation for this is Frege's predicate-singular term analysis of simple sentences (§2). Sentences such as 'Tony is alive' contain a singular term, 'Tony', and a predicate, '( ) is alive'. We can extend this analysis to such sentences as 'Everything is alive' by drawing 'upon [the formula language of] arithmetic'. In arithmetic, a sentence containing a variable, '*x*', is taken to be true if and only if a true sentence results no matter what *x* is supposed to be. For example, '$x + 2 = 2 + x$' is true if and only if, no matter what x may be, $x + 2 = 2 + x$. So, if we allow the argument of '( ) is alive' to be a variable, the resulting sentence '*x* is alive' may be taken to express the generalization of 'Tony is alive'; it will be true if and only if, no matter what *x* may be, *x* is alive. Similarly, 'Everything is not alive' may be represented as '*x* is not alive'. For, given the convention just explained, this will be true if and only if, no matter what *x* may be, *x* is not alive. But, as a little experimentation will show (and as can be proven), it is impossible to represent such sentences as 'Not everything is alive', so long as we use variables in this way alone. Nor can one so express 'If everything is alive, then snow is black'. One could try to represent it as 'If *x* is alive, then snow is black'. But this actually represents 'Everything is such that, if it is alive, then snow is black' (1879: §11).

What is required here is some way of confining the generality expressed by the variable to a part of the sentence. In his informal discussions, Frege uses the phrase ‘no matter what *x* may be’ to do this (for example, 1879: §12). We may then represent ‘Not everything is alive’ as ‘It is not the case that, no matter what *x* may be, *x* is alive’; and ‘If everything is alive, then snow is black’ as ‘If, no matter what *x* may be, *x* is alive, then snow is black’. The phrase ‘no matter what *x* may be’, and its placement in the sentence, is said to delimit the ‘scope’ of the variable (see Scope). Frege’s most vital discovery is not that variables may be used to indicate generality, but that variables have scope; his most significant innovation, the development of a notation in which scope can be represented, that is, his introduction of the *quantifier*.

Frege’s second fundamental contribution was his construction of the first formal system. A formal system, as Frege conceives it, has three parts: first, a highly structured ‘language’ in which thoughts may be expressed; second, precisely specified ‘axioms’, or basic truths, about the subject matter in question; and third, ‘rules of inference’ governing how one sentence may be inferred from others already established. Frege believed that there were a number of advantages to carrying out proofs in such formal systems, for example, that giving a proof in a formal system would better one’s understanding of the proof, by revealing precisely what principles it employs. Suppose, for example, that one wants to show that a given theorem can be proven without using the axiom of choice: the obvious method would be to prove the theorem without using the axiom. But how can one be sure that the axiom has not tacitly been employed (as it was in Richard Dedekind’s proof of Theorem 159 in *Was sind und was sollen die Zahlen?* in 1888)? Proving the theorem in a formal system makes this possible: the axioms which may be used are clearly specified and steps in the proof may be taken only in accordance with certain rules. (Compare 1879: Preface; 1884: §2. Formal systems are important in contemporary logic for related reasons; see Model theory.)

The formal system of *Begriffsschrift* does not actually live up to the standards Frege imposes upon it: not all its rules of inference are explicitly stated. However, this complaint cannot be made about the system presented in Part I of his *Grundgesetze der Arithmetik* (1893). (The first-order fragment of this system is complete; the second-order fragment is a formulation of standard, second-order logic.) The rigour of Frege’s formulation was not equalled until Kurt Gödel’s work in the early 1930s, almost forty years later.

It is arguable that Frege goes even further and, in *Grundgesetze*, presents a semantics for his system; that is to say, he attempts to explain, rigorously, how the formal system is to be interpreted; how its symbols are to be understood. Using these explanations, he attempts to prove that the axioms of the system, so interpreted, are true and that the rules of the system, so interpreted, preserve truth (that is, in technical parlance, to prove the system’s soundness). If these controversial claims are correct, then Frege may also be credited with having anticipated, to a limited extent, the development of model theory.

7 *Die Grundlagen der Arithmetik*: three fundamental principles

In the Preface to *Begriffsschrift*, Frege announced his interest in determining whether the basic truths of arithmetic could be proven ‘by means of pure logic’. Kant’s answer had been negative. According to Kant, the truths of arithmetic are synthetic a priori: for example, knowledge of ‘ $7+5=12$’ requires appeal to intuition (see Kant, I. §§4-5). One of Frege’s main goals in his *Die Grundlagen der Arithmetik (The Foundations of Arithmetic)* was to refute this view by giving purely logical proofs of the basic laws of arithmetic, thereby showing that arithmetical truths can be known independently of any intuition. Frege conceived the formal system of *Begriffsschrift* as an important prerequisite for this project: without it, it would be impossible to determine whether the complex proofs required do indeed depend only upon axioms of ‘pure logic’.

There has been some controversy about what motivated Frege’s logicism - his view that the truths of arithmetic are truths of logic (see Logicism §1). Frege says that his project is inspired by both mathematical and philosophical concerns (1884: §§1-3). Some, notably Paul Benacerraf (1981), have defended the view that Frege was interested in philosophical problems only in so far as they were susceptible of mathematical resolution. However that may be, Mark Wilson (1992) and Jamie Tappenden (1995) have argued that there are important connections between Frege’s work on arithmetic and then recent developments in geometry to which he would have been exposed during his graduate career.

Grundlagen is important for a number of reasons. The philosophy of arithmetic developed in the book is of

continuing interest. Moreover, a large number of more specific theses propounded there have had a profound influence on later philosophers, including Ludwig Wittgenstein, W.V. Quine and Michael Dummett, to name but three. More generally, *Grundlagen* is arguably the first work of analytic philosophy. At crucial points in the book, Frege makes ‘the linguistic turn’: that is, he recasts an ontological or epistemological question as a question about language. Unlike some ‘linguistic’ philosophers, his purpose is not to dissolve the philosophical problem - to unmask it as a ‘pseudo-problem’ - but to reformulate it so that it can be solved.

According to Frege, his work in *Grundlagen* is guided by ‘three fundamental principles’ he states in the Preface:

> always to separate sharply the psychological from the logical, the subjective from the objective;
> never to ask for the meaning of a word in isolation, but only in the context of a proposition;
> never to lose sight of the distinction between concept and object.
>
> (1884: x)

All of these are sufficiently important to warrant separate discussion. The first, which announces Frege’s opposition to ‘psychologism’, has been discussed in §§4-5; the second, which is called ‘the context principle’, will be discussed in §8 below.

The third principle, which distinguishes the sorts of things singular terms denote - objects - from the sorts of things predicates denote - concepts - has already been discussed in §2. Of present interest is the application Frege makes of this distinction in *Grundlagen* §§45-54. Just prior to these sections, Frege has been concerned with what numbers are, his results having been almost entirely negative: numbers are neither physical objects; nor collections or properties of such; nor subjective ideas. Frege now suggests that progress may be made by asking to what, exactly, number is ascribed. The crucial observation is that different numbers seem to be assignable to the same thing: of a pack of cards, for example, one could say that it was one pack or fifty-two cards. Frege realizes that this might suggest that ascription of number is subjective; dependent upon our way of thinking about the object in question (1884: §§25-6). But what is different in our way of regarding the pack is, specifically, the ‘concept’ we choose to employ: that denoted by ‘( ) is a pack’ in the one case, or by ‘( ) is a card’ in the other. If, with Frege, we insist that concepts, and facts about them, can be just as objective as objects and facts about them (1884: §48; 1891), there is no need to regard number as subjective. Rather, we must acknowledge that number is ascribed not to objects, nor to collections thereof, but to concepts:

> If I say ‘Venus has 0 moons’, there simply does not exist any moon or agglomeration of moons for anything to be asserted of; but what happens is that a property is assigned to the *concept* ‘moon of Venus’, namely that of including nothing under it. If I say, ‘the King’s carriage is drawn by four horses’, then I assign the number four to the concept ‘horse that draws the King’s carriage’.
>
> (1884: §46; emphasis added)

(Note that we will use ‘"moon of Venus"’ and ‘( ) is a moon of Venus’ to denote the same concept.) As Frege famously puts the point in §55: ‘the content of a statement of number is an assertion about a concept’.

Observe here how Frege’s interest in what numbers are has led him to an interest in the nature of ascriptions of number and, in particular, to an investigation of the ‘logical form’ of such statements. According to Frege, the most fundamental way of referring to a number is by means of an expression of the form ‘the number belonging to the concept *F*’; for example, ‘the number belonging to the concept "moon of the earth"’ refers to the number one, for there is just one object that is a moon of the earth. This seemingly innocuous linguistic claim plays a crucial role in Frege’s account of what numbers are.

8 *Die Grundlagen der Arithmetik*: the context principle

Frege denied both that numbers are physical objects and that they are objects of intuition, in Kant’s sense. In *Grundlagen* §62, he therefore raises the question of how ‘numbers [are] given to us, if we cannot have any ideas or intuitions of them’. This question is plainly epistemological, concerning how we can have knowledge of the objects (and so the truths) of arithmetic. What is astonishing is how Frege sets about answering it: ‘Since it is only in the context of a proposition that words have any meaning, our problem becomes this: to define the sense of a proposition in which a number word occurs.’ As Michael Dummett has emphasized, Frege here makes ‘the

linguistic turn' in a profound way: what was plainly an epistemological problem is converted into one about language (Dummett 1991: 111-12). The question of how we can have knowledge about numbers becomes the question of how we refer to - that is, succeed in talking about - numbers.

Frege suggests that this question can be answered by examining whole sentences in which names of numbers occur. It is here that the second of Frege's fundamental principles, the context principle, is at work. Frege rejects any requirement that he should point out or, in some other way, display numbers for his audience. He has already asserted that this would be impossible, since numbers cannot be encountered in perception (we have no 'ideas' of them) or in intuition. Rather, Frege insists, one's ability to refer to numbers should be explained in terms of one's understanding of complete sentences in which names of numbers are employed. That is to say, Frege refuses to say what 'zero' refers to except to say what such sentences as 'Zero is the number belonging to the concept "moon of Venus"' mean. More precisely, he insists that to explain the meanings of such sentences is to say what 'zero' refers to.

Frege intends this view to be generalized: indeed, his own discussion of it does not concern numbers directly, but the analogous case of directions. So-called abstract objects pose serious philosophical problems, both ontological and epistemological. Frege's strategy for defending their existence and for defusing worries about our cognitive access to them is appealing and may well seem the only workable option. His general idea, that our capacity to refer to objects of a given kind may be explained only in terms of our understanding of sentences containing names of them, has been of continuing influence.

To return to our main thread, the immediate goal is to explain the meaning of sentences in which reference is made to numbers. Frege claims that, when we are concerned with names of *objects*, the most important such sentences are those asserting an identity. Because Frege takes numbers to be objects, he focuses upon such sentences as 'The number belonging to the concept "plate on the table" is the same as that belonging to the concept "guest at dinner"'. Frege observes that this sentence will be true if and only if there is a way of assigning plates to guests such that each guest gets exactly one plate and each plate, exactly one guest; that is, if and only if there is a one-to-one correlation between the plates and the guests. More generally, say that the concept F is equinumerous with the concept G if and only if there is a one-to-one correlation between the objects falling under F and those falling under G. Then the thought is this: the number belonging to the concept $F =$ the number belonging to the concept G if and only if the concept F is equinumerous with the concept G. Since Frege introduces it with a quotation from Hume, this is sometimes called 'Hume's Principle' (1884: §§55-63). The principle had been known for some time, but it was only in the work of Georg Cantor (1897) that its mathematical significance was fully realized (see Set theory §2).

Of course, if Hume's Principle is to play any role in Frege's attempt to prove the axioms of arithmetic from logical principles alone, the notion of equinumerosity must be definable in purely logical terms. But Frege shows that it is, if the general theory of relations is accepted as part of logic (1884: §§70-2).

For reasons which are not entirely clear, Frege rejects the claim that Hume's Principle suffices to explain numerical identities. His stated reason (1884: §66; compare §56) is that it fails to decide whether Julius Caesar is the number zero! But there is little agreement about the point of this complaint or about its force. Still, Hume's Principle continues to be important to Frege, since he insists that any correct explanation of numbers must have Hume's Principle as a (relatively immediate) consequence. He himself settles upon an explicit definition of names of numbers: the number belonging to the concept F is to be the extension of the second-level concept '[ ] is a concept equinumerous with the concept F'. (Roughly, the extension of a concept is the collection of things that fall under that concept.) Frege shows how Hume's Principle may be derived from this definition (1884: §73). To make the definition and proof precise, however, he has to appeal to some axiom concerning extensions. Frege's idea, developed in *Grundgesetze*, was that extensions could be characterized by means of a principle analogous to Hume's Principle, namely, his Basic Law V: the extension of the concept F is the same as that of the concept G if and only if the very same objects fall under the concepts F and G (1893: §§3, 20). Famously and unfortunately, however, Bertrand Russell showed Frege, in 1902, that the resulting theory of extensions is inconsistent, since Russell's paradox can be derived from Basic Law V in (standard) second-order logic (see Paradoxes of set and property §4).

9 Frege's formal theory of arithmetic

The story of Frege's work on arithmetic might well have ended there. In *Grundlagen*, Frege does sketch proofs of axioms for arithmetic (1884: §§70-83) and, in *Grundgesetze*, offers formal versions of them (1893: §§78-119). But little attention was paid to these proofs for almost a century, on the ground that Frege gave his proofs in an inconsistent theory, and anything can be proven in an inconsistent theory. Frege himself decided in about 1906 that no suitable reformulation of Basic Law V was forthcoming and, his wife having died in 1904, appears to have become deeply depressed. He published nothing at all between 1908 and 1917 and only three further articles after that.

Closer attention to the structure of Frege's proofs reveals something interesting, however. As already stated, Frege requires that his explicit definition of names of numbers imply Hume's Principle, and he shows that it does (given Basic Law V). But neither the explicit definition nor Basic Law V is used essentially in the proof of any other arithmetical theorem; these other theorems are proven using only second-order logic and Hume's Principle. Thus, Frege in fact proves that axioms for arithmetic can be derived in second-order logic from Hume's Principle alone. Frege himself knew as much, but, sadly, never appreciated the philosophical and mathematical significance of this result, now known as Frege's Theorem.

The details of Frege's proof of this result are beyond the scope of this discussion. But a few points are worth mentioning. First, one cannot actually prove each of the infinitely many truths of arithmetic from logical principles, or from anything else. So any attempt to show that all truths of arithmetic follow from logical principles, or from Hume's Principle, will depend upon the identification of some finite number of basic laws, or axioms, of arithmetic from which we are confident all other arithmetical truths will follow. The most famous such axioms are those due to Dedekind (though widely known as the Peano axioms; see Numbers §6). Frege employs his own axiomatization which, while similar, is importantly different and arguably more intuitive (1893: §§128-57).

Second, Frege's hardest task is to prove that there are infinitely many numbers, and his method of doing so is extremely elegant. The basic idea is as follows. Begin by noting that 0 is the number belonging to the concept 'object not the same as itself' and then that 1 is the number belonging to the concept 'identical with 0'. Further, 2 is the number belonging to the concept 'identical with 0 or 1', and so on. More generally, if *n* is finite, then the number of the concept 'natural number less than or equal to *n*' is always one more than *n*, which implies that every finite number has a successor and (in the presence of the other axioms) that there are infinitely many numbers (1884: §§82-3; 1893: §§114-19).

Third, Frege needs, for a variety of reasons, to define the notion of a finite, or natural, number. He also needs to prove the validity of proof by induction, since one of his (and Dedekind's) axioms is, essentially, that such proofs are legitimate. Induction is a way of proving that all natural numbers fall under a concept *F*; a proof by induction proceeds by showing (1) that 0 falls under *F* and (2) that, if a number *n* falls under *F*, $n+1$ must also fall under *F*. In essence, Frege *defines* the natural numbers as those objects for which induction works. According to Frege's definition, a number is a natural number if and only if it falls under every concept *F* which is a concept (1′) under which 0 falls and (2′) which is 'hereditary in the number series', that is, under which $n+1$ falls whenever *n* does. It then follows, immediately, that proof by induction is valid: if *F* is a concept satisfying (1) and (2), then, since *F* is then a concept satisfying (1′) and (2′), every natural number must fall under it, by definition.

It is possible to see, intuitively, that this is a good definition, that is, that what Frege calls 'the natural numbers', the things that fall under every concept satisfying (1′) and (2′), *really are* the natural numbers. Certainly, if *x* is a natural number, then it falls under every concept satisfying (1′) and (2′). Conversely, suppose that *x* falls under every concept satisfying (1′) and (2′). Well, the concept 'natural number' is such a concept: for (1′′) 0 certainly falls under it, and (2′′) whenever a number *n* falls under it, $n+1$ also falls under it. So, since *x* falls under *every* concept satisfying (1′) and (2′), it must fall under this one, that is, it must be a natural number. Thus, falling under every concept satisfying (1′) and (2′) is both necessary and sufficient for being a natural number. (Objections can be made to this argument, chiefly on the grounds of its 'impredicativity'; see Property theory §1.)

This method of definition may be generalized to furnish a definition of the 'ancestral' of any given relation. Frege's definition of the ancestral, introduced in *Begriffsschrift* (and independently discovered by Dedekind), is of quite general importance in mathematics.

Frege's formal work in *Grundgesetze* does not end with his proof of the arithmetical axioms. He goes on to develop purely logical definitions both of finitude and of infinitude; he proves the so-called categoricity theorem, that any two structures which satisfy his axioms for arithmetic are isomorphic; and he proves the validity of definition by induction. (These last two results were first proven by Dedekind.) There is also some reason to believe that Frege was interested in proving results now known to depend upon the axiom of choice and that his investigations led him to discover - though not to communicate - this axiom some years before Ernst Zermelo's formulation of it in 1904 (see Axiom of choice). Finally, in later parts of *Grundgesetze*, Frege proves a number of preliminary results required for a logicist development of the theory of real numbers, but a projected third volume, which would have completed that part of the project, was abandoned in the wake of Russell's paradox.

10 The fate of Frege's logicism

Frege proved Frege's Theorem, that is, that axioms for arithmetic are (second-order) logical consequences of Hume's Principle. Of course, this would be of little interest but for the fact that, unlike Basic Law V, Hume's Principle is consistent. If, therefore, Hume's Principle could be argued to be a truth of logic, then the truths of arithmetic, being logical consequences of a truth of logic, would all be truths of logic and logicism would be vindicated! Work on Frege's philosophy of arithmetic has therefore tended to abstract from Frege's ill-fated explicit definition and to concern itself with the view Frege himself rejected, namely that names of numbers may be defined, or explained, by means of Hume's Principle.

No one nowadays really thinks that Hume's Principle is a truth of logic. Still, one might think that Hume's Principle is suitable as some kind of definition, or philosophical explanation, of names of numbers. And, or so argues Crispin Wright (1983), if the truths of arithmetic turn out to be logical consequences of an explanation, is that not almost as good as if they were truths of logic? This view is appealing precisely because Hume's Principle does seem to capture something very fundamental about (cardinal) numbers: saying that the number belonging to the concept *F* is the same as that belonging to *G* if and only if the concepts *F* and *G* are equinumerous just does seem a good way of explaining what (cardinal) numbers are. Still, there are serious worries. Saying that the extension of *F* is the same as the extension of *G* if and only if the same objects fall under *F* and *G* also *seems* to be a good way of explaining what extensions are - until one realizes this explanation is inconsistent. Hume's Principle is not inconsistent, of course, but one might wonder whether it can rightly be viewed as explanatory of what numbers are if such a kindred principle cannot rightly be viewed as explanatory of what extensions are. It is in the debate over this, the 'bad company objection' raised by George Boolos (1987) and Michael Dummett (1991), that the fate of Frege's logicism will be decided.

List of works

Frege, G. (1952) *Translations from the Philosophical Writings of Gottlob Frege*, ed. P.T. Geach and M. Black, Oxford: Blackwell, 3rd edn, 1980.(The page numbers of the original publications appear in the text.)

Frege, G. (1984) *Collected Papers on Mathematics, Logic and Philosophy*, ed. B. McGuinness, Oxford: Blackwell.(This includes translations of almost all of Frege's published papers; the page numbers of the original publications appear in the margins.)

Frege, G. (1879) *Begriffsschrift, eine der arithmetischen nachgebildete Formelsprache des reinen Denkens*, Halle: Nebert; trans. '*Begriffsschrift*, a Formula Language, Modelled Upon That of Arithmetic, for Pure Thought', in J. van Heijenoort (ed.) *From Frege to Gödel: A Source Book in Mathematical Logic, 1879-1931*, Cambridge, MA: Harvard University Press, 1967, 1-82.(Includes the first formulation of Frege's system of logic, and discussion of its importance for philosophical reflection on language and thought.)

Frege, G. (1884) *Die Grundlagen der Arithmetik: eine logisch-mathematische Untersuchung über den Begriff der Zahl*, Breslau: Koebner; trans. J.L. Austin, *The Foundations of Arithmetic: A Logico-Mathematical Enquiry into the Concept of Number*, Oxford: Blackwell, 2nd edn, 1980.(Includes criticism of then extant views about the nature of arithmetic, motivation for Frege's own proposal and informal proofs of the laws of arithmetic. One of Frege's most central texts.)

Frege, G. (1891) *Funktion und Begriff*, Jena: Pohle; trans. P.T. Geach, 'Function and Concept', in *Translations*

and *Collected Papers*.(Important paper in which Frege offers his analysis of concepts as functions whose values are restricted to the two truth-values.)

Frege, G. (1892a) 'Über Sinn und Bedeutung', *Zeitschrift für Philosophie und philosophische Kritik* 100: 25-50; trans. M. Black, 'On Sense and Meaning', in *Translations* and *Collected Papers*.(Frege's most famous and seminal paper in which he argues for the distinction between the sense and reference of expressions and presents a number of important theses regarding the two notions.)

Frege, G. (1892b) 'Über Begriff und Gegenstand', *Vierteljahrsschrift für wissenschaftliche Philosophie* 16: 192-205; trans. P.T. Geach, 'On Concept and Object', in *Translations* and *Collected Papers*.(Expands on what Frege takes to be the fundamental distinction between concepts and objects.)

Frege, G. (1892-5) 'Ausführungen über Sinn und Bedeutung', trans. P. Long and R. White, 'Comments on Sense and Meaning', in *Posthumous Writings*, ed. H. Hermes, F. Kambartel and F. Kaulbach, Oxford: Blackwell, 1979, 118-25. (Expands some of the themes in Frege 1892a and discusses the importance of the sense/reference distinction in connection with predicates.)

Frege, G. (1893, 1903) *Grundgesetze der Arithmetik: begriffsschriftlich abgeleitet*, Jena: Pohle, 2 vols; repr. as *Grundgesetze der Arithmetik*, Hildesheim: Olms, 1966; Part 1 of vol. 1 trans. M. Furth, *Basic Laws of Arithmetic: An Exposition of the System*, Berkeley, CA: University of California Press, 1964; no complete translation of vol. 2 exists, though fragments, trans. M. Black and P.T. Geach, appear as 'Frege on Definitions', 'Frege Against the Formalists' and 'Frege on Russell's Paradox', in *Translations*.(Gives a rigorous exposition of Frege's mature logic, with some philosophical discussion of its importance and an extended discussion of psychologism. Also includes formal proofs of the laws of arithmetic within this system, and the beginnings of a development of a theory of real numbers.)

Frege, G. (1894) Review of Edmund Husserl's *Philosophie der Arithmetik*, *Zeitschrift für Philosophie und philosophische Kritik* 103: 313-32; trans. H. Kaal, in *Collected Papers*.(One of the most important of Frege's discussions of 'psychologism'.)

Frege, G. (1897a) 'Logik', in *Nachgelassene Schriften und Wissenschaftlicher Briefwechsel (Posthumous Writings)*, ed. H. Hermes, F. Kambartel and F. Kaulbach, Hamburg: Meiner, 1969-76.(A philosophical treatise on notions fundamental to logic, such as assertion, thought, sense and the like. A predecessor of Frege 1918.)

Frege, G. (1897b) 'Über die Begriffsschrift des Herrn Peano und meine eigene', *Berichte über die Verhandlungen der königlich Sächsischen Gesellschaften der Wissenschaften zu Leipzig, mathematisch-physische Klasse* 48: 362-8; trans. V. Dudman, 'On Mr. Peano's Conceptual Notation and My Own', in *Collected Papers*.(A comparison of Frege's logic with that of Peano, bringing out certain of the advantages of the former.)

Frege, G. (1903, 1906) 'Über die Grundlagen der Geometrie' (first and second series), *Jahresbericht der Deutschen Mathematiker Vereinigung* 12: 319-24, 368-75 and 15: 293-309, 377-403, 423-30; trans. E.-H. Kluge, 'The Foundations of Geometry: First Series' and 'The Foundations of Geometry: Second Series', in *Collected Papers*.(A critical discussion of David Hilbert's work on the foundations of geometry, frequently cited in connection with Frege's attitude towards early work in model theory.)

Frege, G. (1918) 'Der Gedanke: eine logische Untersuchung', *Beiträge zur Philosophie des deutschen Idealismus* 1: 58-77; trans. P.T. Geach and R. Stoothoff, 'Thoughts', in *Collected Papers*.(Late paper of Frege's in which he focuses on the nature of thoughts, that is, the senses of complete statements, and emphasizes their objectivity and their independence of psychology.)

Frege, G. (1969-76) *Nachgelassene Schriften und Wissenschaftlicher Briefwechsel*, ed. H. Hermes, F. Kambartel and F. Kaulbach, Hamburg: Meiner; trans. *Posthumous Writings*, ed. H. Hermes, F. Kambartel and F. Kaulbach, Oxford: Blackwell, 1979. (Translations of Frege's extant unpublished writings, most of which were destroyed during the bombing of Münster in the Second World War.)

Dummett, M. (1991) *Frege: Philosophy of Mathematics*, London: Duckworth; repr. 1995. (Mentioned in §§8, 10, this raises the ‘bad company objection’; a sequel to *Frege: Philosophy of Language*, it is somewhat more accessible but perhaps not as definitive.)

Dummett, M. (1993) *The Seas of Language*, Oxford: Clarendon Press. (This is a collection of essays some of which first forcefully raised the issues discussed in §5.)

Evans, G. (1981) ‘Understanding Demonstratives’, in H. Parrett and J. Bouveresse (eds) *Meaning and Understanding*, Berlin: de Gruyter, 280-303; repr. in *Collected Papers*, Oxford: Clarendon Press, 1985, 291-321. (Puts forward an important interpretation of Frege’s views on sense and reference; mentioned in §3.)

Heck, R.G., Jr (1993) ‘The Development of Arithmetic in Frege’s *Grundgesetze der Arithmetik*’, *Journal of Symbolic Logic* 58: 579-601; repr. in Demopoulos 1995, 257-94. (This paper includes an extended, technical discussion of Frege’s formal work on arithmetic.)

Parsons, C. (1965) ‘Frege’s Theory of Number’, in M. Black (ed.) *Philosophy in America*, Ithaca, NY: Cornell University Press, 180-203; repr. in Demopoulos 1995, 182-210. (This is a classic, accessible paper on Frege’s philosophy of arithmetic, that raises many central issues.)

Ricketts, T. (1986) ‘Objectivity and Objecthood: Frege’s Metaphysics of Judgment’, in J. Hintikka and L. Haaparanta (eds) *Frege Synthesized*, Dordrecht: Reidel, 65-95. (This is a dense work that discusses the question, mentioned in §6, of whether Frege anticipated modern semantics.)

Tappenden, J. (1995) ‘Frege on Extending Knowledge and "Fruitful Concepts"’, *Nous* 29: 427-67. (Mentioned in §7, it discusses the relation between Frege’s work on arithmetic and developments in geometry with which he would have been familiar.)

Wilson, M. (1992) ‘Frege: The Royal Road from Geometry’, Nous 26: 149-80; repr. in Demopoulos 1995, 108-59. (Mentioned in §7, it presents an interpretation of Frege’s work relying heavily on connections with work in geometry.)

Wright, C. (1983) *Frege’s Conception of Numbers as Objects*, Aberdeen: Aberdeen University Press. (Mentioned in §9, it includes important discussions of logicism and the context principle and the first post-Fregean proof of Frege’s Theorem.)

Frei, Hans (1922-88)

Frei was concerned with two particular questions: why had the traditional Christian mode of biblical interpretation collapsed in the modern world, and how could it be recovered? He argued that, while the traditional interpretation of the Bible treated it as realistic narrative, in the modern period it had become accepted to treat the events described in it as myths and allegories. He argued for a more literal interpretation of the Gospels, which could lead to a more realistic interpretation of the person and nature of Jesus.

Hans Frei was an American theologian who fled his native Germany before the Second World War, and spent almost all of his teaching career at Yale University. He was of the view that, until the modern period, there had been near-consensus in the Church around the convictions that the Bible must be interpreted as one book, that the Gospels must be given priority in that unified interpretation, and that the Gospels as a whole must be interpreted literally. It was especially the collapse of consensus over the third element that drew Frei's attention. In the modern world, the Gospels are regularly interpreted as allegories, myths or moral tales.

Frei argued that there is something very strange about this. The Gospels are narratives. If one looks at the sort of narratives they are, it seems obvious that they are very different from paradigmatic examples of allegorical, mythical or moral narratives. The genre that fits them best is that of realistic narrative. Frei delineated various hallmarks of this genre, emphasizing especially that a realistic narrative, by tracing persons' actions and their reactions to features and events in their situation, renders the narrative identity of persons. It tells us who they are. The application of this point to the Gospels is that they render the narrative identity of Jesus.

One can summarize that identity in various ways: they narrate Jesus' enactment of his Messiahship, they narrate Jesus' enactment of the coming of God's kingdom, and so forth. What one cannot say, however, is that they are about such things as 'the coming of God's kingdom' or 'divine-human reconciliation'. To interpret them thus is to overlook their realistic narrative character and turn them into allegories or myths about some abstraction. The point - or, as Frei usually called it, the 'meaning' - of a realistic narrative is not something outside the narrative but the narrative itself, with its thematic core.

If, then, the literary genre of the Gospels is realistic narrative, why in the modern world have they been interpreted as allegories, as myths, as moral tales? Frei's answer is that interpreters confused 'meaning' with 'reference'. They assumed that the point of these narratives lies in something outside the narrative rather than in the narrative itself. They furthermore confused *history-likeness* in a narrative with the *historicity* of the narrative. Putting these points together: they assumed that the point of these narratives was to put us in touch with events in ancient history. But then scepticism set in as to whether the events really did occur. Yet most interpreters resisted concluding that these narratives lack 'meaning'. So they searched for aspects of reality other than ancient historical events which these narratives might be 'about'; and they construed the narratives as allegories of or myths about those aspects. Thus there occurred, to quote the title of Frei's best-known book, an 'eclipse of biblical narrative'.

Frei repudiated the assumption that meaning is reference in the case of the Gospels. The meaning of the Gospel narratives is what they say. The narrative interpretation that he called for finds literary criticism of far more use than historical studies. Frei's *The Eclipse of Biblical Narrative* (1974) is open to the antirealist interpretation that the important thing in the case of the Gospels is nothing but the story. When Frei's other major book, *The Identity of Jesus Christ* (1975), published almost simultaneously with *Eclipse*, is brought into the picture, it becomes clear that that was not his view. The Gospels - provided we interpret them as realistic narratives - present to us an actual historical person, Jesus of Nazareth, in his fundamental identity. They constitute the best access we have to that person; and, for religious purposes, an entirely adequate access. It is true that we do not have a proof of this. The situation is rather that some people, upon reading the Gospels, find themselves believing that they are in the 'presence' of Jesus of Nazareth, and are entitled to so believe.

It comes as no surprise to learn that after the publication of *Eclipse* and *Identity*, Frei began to emphasize the legitimacy and importance of what some have called 'Anselmian theology'; that is, theology that from the beginning is conducted as an exposition of Christian belief, in contrast to theology that develops natural or foundational theology before it sets about expounding Christian belief.

French philosophy of science

A distinctively French tradition in the philosophy of science began with Descartes, continued through the Enlightenment in works such as D'Alembert's Discours préliminaire and the Encyclopédie, and flowered in the ninteenth and the early twentieth century with the work of Comte, Duhem, Meyerson and Poincaré. Throughout the twentieth century, the dominant fashions in French philosophy derived more and more from German influences, especially idealism and phenomenology (Hegel to Heidegger). But amidst these developments, there persisted an essentially autonomous tradition of French philosophy of science that offered an indigenous alternative to the Germanic imports. Here the key figure was Gaston Bachelard (1884-1962), for many years professor at the Sorbonne and director of the Institut d'Histoire des Sciences et des Techniques. His work was continued and modified by Georges Canguilhem (1904-95), his successor at the Institute, who himself was an important influence on philosophers such as Louis Althusser, Michel Foucault and Michel Serres. Jean Cavaillès' critique of Husserl's philosophy of mathematics and his effort to develop a neo-Hegelian alternative to it had deep affinities with Bachelard's work and was also an important influence on Canguilhem.

The most important general features of twentieth-century French philosophy of science appear if we contrast it with its two major rivals: existential phenomenology and logical positivism. Existential phenomenology is a 'philosophy of the subject', maintaining that ultimate truth resides in the immediacy of lived experience. Bachelard and his followers, by contrast, proposed a 'philosophy of the concept', for which experiential immediacy is subordinate to and corrected by concepts produced by rational reflection. This process of rational reflection is, moreover, embodied in science, which is not, as existential phenomenology maintains, a derivative and incomplete form of knowing, but the very paradigm of knowledge. In giving science a privileged epistemic position, the French philosophers of science are like the logical positivists. But, unlike the positivists, they treat science as essentially historical, irreducible in either method or content to the rigour of a formal system. They also opposed the positivists' effort to find the foundations of scientific knowledge in sense experience, maintaining that there are no simply given data and that all experience is informed by conceptual interpretation.

1 Bachelard's philosophy of science: epistemology and method

Bachelard accepts Descartes' view that knowledge derives from the methodical questioning of accepted beliefs (see Descartes, R. §4). But he is explicitly anti-Cartesian in rejecting the idea that, from this questioning, there emerge intuitive certainties that provide an unshakeable foundation for knowledge. Descartes' absolute certainty requires an entirely simple object (lest there be any hidden complexity misleading our judgment) and a subject that is entirely transparent to itself (lest we be deceived by unexamined prejudices or other distortions). But Bachelard maintains that such simplicity and transparency are not available; as the history of science amply shows, future generations always discover complexities and prejudices unnoticed by previous inquirers.

Scientific inquiry, therefore, never attains the entirely clear path Descartes sought but is always blocked, in some key respects, by *epistemological obstacles*. These are ways of thinking and perceiving, typically tied to common sense or past scientific theories, that prevent us from seeing truths essential for the further progress of science. Early chemistry, for example, had to overcome faulty intuitions based on the animism of primitive common sense; twentieth-century physics had to break through inadequate concepts of space, time and causality implicit in classical physics. Because of the need, at every stage, to overcome such obstacles, the development of science is not a continuous progress but a series of *epistemological breaks*, whereby scientists attain new conceptions of nature and of the methods required to study it.

In Bachelard's view the development of science is not continuous, but it is progressive. This is so in two respects: first, some scientific results are permanently valid and must be preserved in all subsequent formulations; second, successive scientific theories in a given domain provide a more general perspective from which the claims of previous theories can be assessed and, to the extent they are found valid, incorporated into current thinking.

Given his anti-Cartesian stance, the methodology of Bachelard's philosophy of science must be historical. The nature of scientific thinking cannot be determined from a priori principles but must be discerned from a close examination of actual scientific practice. However, within this historical approach, current science holds a privileged position as the best available account of nature. It alone is a basis for judging the degree of descriptive

and methodological success attained by previous scientific efforts. In Bachelard's terminology, contemporary science allows us to judge which parts of scientific history are valid (*l'histoire sanctionée*) and which outdated (*l'histoire périmée*). Thus, in contrast to ordinary political history, the history of science does not aim at a narration of objective facts that refrains from judging past events by contemporary standards. History of science essentially involves normative judgments of the past it studies.

As science develops, then, so too does the philosophy of science. (Bachelard in fact thinks that all domains of philosophy, not just the philosophy of science, develop in tandem with science.) He sees his own philosophy of science, in particular, as developing out the 'new scientific spirit' that gave rise to the relativistic and quantum revolutions at the beginning of the twentieth century. For example, Bachelard's notions of epistemological obstacle and epistemological break reflect the self-consciously revolutionary character of twentieth-century physics. Similarly, physicists' derivation of classical laws as limiting cases of the principles of relativity and quantum theory are the model for Bachelard's account of the way later theories contain the truth of earlier ones.

2 Bachelard's philosophy of science: metaphysics

The influence of current science on Bachelard's philosophy of science is particularly evident in his treatment of the reality of scientific entities. He vigorously opposes what he calls 'realism', by which he means the view that the middle-sized objects of ordinary sense experience are the fundamental realities of the world. According to Bachelard, the development of science has amply demonstrated that accounts based on such objects are entirely unequal to the task of explaining the facts of experience and must, therefore, be replaced by the more adequate ontology of theoretical science.

Although Bachelard thinks the explanatory power of science establishes the ontological priority of its theoretical postulations, he also maintains that a proper understanding of contemporary physics excludes metaphysical realism, which would see scientific entities as mind-independent substances. First, the metaphysics underlying the mathematical formalisms of the new physics are of mutually interdependent processes, not autonomous substances. More importantly, Bachelard maintains that the way in which contemporary physics constructs its objects reveals that they cannot be regarded as entirely independent of mental processes. Any particular scientific object (for example, Bohr's atom) is a construction of theoretical reason. Nonetheless, Bachelard does not accept the idealist claim that objects are simply the creations of mind. Any particular act of theoretical construction operates on an object pregiven to it.

Bachelard characterizes his position as an 'applied rationalism' that mediates between the metaphysical poles of realism and idealism. It is a 'rationalism' because it maintains the active role of the mind in the constitution of its objects and the priority of theoretical conceptualization over sense experience. The mind's activity, however, is not an autonomous creation but an application of its concepts to an object already given to it (through, of course, previous conceptualizations). Bachelard further separates himself from classical forms of idealism by giving scientific instruments an essential role in the constitution of scientific objects. Instruments are the material realization of theories, and such realization is necessary for the constitution of a scientific object. The mind constitutes objects only through the material intermediary of technical (instrumental) intervention in the world (see Scientific realism and antirealism §§3-4).

Bachelard's applied rationalism is very nicely illustrated by his account of how a modern scientist would undertake the investigation of the nature of wax suggested by Descartes in his *Second Meditation*. Descartes focuses on a piece of wax in its natural state, fresh from the hive, describes its appearance under various everyday circumstances (warmed by the sun, rolled between the fingers, and the like), and derives the essential nature of wax (as an extended body) from intellectual reflection on these descriptions. A modern scientist, by contrast, systematically transforms the 'natural' wax through experimental procedures that theory tells us will allow the observation of its characteristic features. It is purified, melted and methodically reshaped, X-rayed to obtain diffraction patterns, and so on. Its qualities appear not as simple givens to our intuition but as products of our rational experimental techniques (see Experiment; Observation).

Bachelard's philosophy of science obviously relies on a sharp distinction between the scientific and the nonscientific (see Demarcation problem). He sees the history of thought as a long struggle of scientific reason to overcome obstacles posed by nonscientific modes of thought and experience. For Bachelard, the fundamental

epistemological break is the one that separates science from the illusions of the senses and the imagination. Bachelard does not, however, deny all positive significance to the nonscientific realm of sense and imagination. He makes room for this realm in a series of studies on the 'poetics' of human thought. Here he introduces the project of a 'psychoanalysis' of reason that would uncover the unconscious significance of primitive images (such as those of earth, air, fire and water). He continues to deny that such images have any role in the objective description of what the world is like, resisting, as he says, 'the ontological temptation of beauty'. But he insists on the irreducible value of the subjective realm of poetic images as a necessary aesthetic complement to scientific knowing.

3 Canguilhem on concepts and theories

Georges Canguilhem succeeded Bachelard as director of the Institut d'Histoire des Sciences et des Techniques. Although he starts from an essentially Bachelardian view of science, the foci of his work are different from Bachelard's: philosophical history rather than historical philosophizing, the biological and medical sciences rather than physics and chemistry. Further, his results suggest a number of important modifications to Bachelard's position.

Canguilhem's most important methodological contribution is his distinction between concepts and theories. In much twentieth-century philosophy of science, concepts are functions of theories, deriving their meaning from the roles they play in theoretical accounts of phenomena (see Theories, scientific). Newtonian and Einsteinian mass, for example, are regarded as fundamentally different concepts because they are embedded in fundamentally different physical theories. This subordination of concept to theory derives from the view that the interpretation of phenomena (that is, their subsumption under a given set of concepts) is a matter of explaining them on the basis of a particular theoretical framework. For Canguilhem, by contrast, there is a crucial distinction between the interpretation of phenomena (via concepts) and their theoretical explanation. According to him, a given set of concepts provides the preliminary descriptions of a phenomenon that allow the formulation of questions about how to explain it. Different theories (all, however, formulated in terms of the same set of basic concepts) will provide competing answers to these questions. Galileo, for example, introduced a new conception of the motion of falling bodies to replace the Aristotelian concept. Galileo, Descartes and Newton all employed this new conception in their descriptions of the motion of falling bodies and in the theories they developed to explain this motion. Although the basic concept of motion was the same, the explanatory theories were very different. This shows, according to Canguilhem, the 'theoretical polyvalence' of concepts: their ability to function in the context of widely differing theories. His own historical studies (for example, of reflex movement) are typically histories of concepts that persist through a series of theoretical formulations.

Taken seriously, Canguilhem's emphasis on the history of concepts as opposed to the history of theories requires important modifications to Bachelard's view of science. Epistemological breaks, for example, must be construed as due to conceptual rather than theoretical innovation. Since successful conceptualizations tend to reappear in even quite diverse theories, epistemological breaks are, for Canguilhem, less frequent and, in many cases, less radical than Bachelard had suggested. The priority of concepts also requires us to rethink the notion of an epistemological obstacle. The same piece of scientific work may be an obstacle in terms of the theoretical context in which it is formulated and a creative breakthrough in terms of some of its conceptual content. Thus Black, even though working in the now outdated context of phlogiston theory, introduced the enduring concept of specific heat. The notion of an epistemological obstacle is more ambivalent than Bachelard suggests. Canguilhem makes particularly effective use of this ambivalence in his discussion of vitalism, so often abused as an enemy of progress in biology. Canguilhem admits that vitalistic theories have generally impeded the development of more adequate mechanistic accounts, but he maintains that the concept of vitalism, through its insistence on the uniqueness of biological phenomena, has served as a valuable protection against unfortunate reductionist tendencies of mechanistic theories (see Vitalism).

Canguilhem's refinement of the notions of epistemological breaks and obstacles also suggests a weakening of Bachelard's sharp distinction between science and nonscience. Science is what overcomes epistemological obstacles and effects epistemological breaks. To the extent that the notions of obstacle and break have become ambivalent, so has the notion of science. As a result, Canguilhem is reluctant to say more than that - in a given context - a given idea or approach is 'more scientific' than another (that is, more fully integrated into current experimental procedures). Further developing this line of thought, Canguilhem (influenced here by his students,

Althusser and Foucault) introduced the notion of *scientific ideology* as an intermediary between science and nonscience.

A scientific ideology (Herbert Spencer's philosophy of evolution is a good example) is scientific in the sense that it models itself on a successful scientific theory. It is ideological, however, because it makes claims about the world that go beyond what the science contemporary with it is able to establish; it has, in other words, pretensions that are not scientifically grounded. Such pretensions may very well function as obstacles to the development of science. But Canguilhem also sees a positive role for scientific ideologies: they provide an essential, if not entirely responsible, dimension of intellectual adventure, without which many scientific advances would not occur. Scientific ideologies are a prime example of the ambivalence of epistemological obstacles.

4 Rationality and norms

Like other antifoundational philosophers of science, Bachelard and Canguilhem must pay particular attention to the problem of rationality and objectivity. If there are no Cartesian certainties grounding science, if its development is a contingent historical process, what guarantee do we have that it is a reliable source of truths about the world? The historicist turn in Anglo-American philosophy of science, which is in many ways a later parallel to the French development, encountered these same questions.

Bachelard tried to ground the objectivity of science through social norms. Contrary to Descartes, he holds that objectivity is not found in the individual self's intuitions (which will always remain obstacles to scientific progress) but in a move to considerations that convince not just a given individual but all rational minds. This move, which Bachelard characterizes as from the isolated *cogito* (I think) to the social *cogitamus* (we think), takes us, he maintains, from the subjectivity of the merely psychological to the objectivity of the epistemological.

Canguilhem offers a much more extensive treatment of norms, rooted in his analysis of biological norms. He notes that, whereas modern physics has rejected any distinction between normal and pathological states of its entities, biological systems (organisms) require a distinction between states that enhance their functioning and those that impede it; in other words, a distinction between health and disease. However, Canguilhem maintains, we cannot define health as simply life in accord with the relevant biological norms. In any state, even one that is clearly pathological, there will be norms specifying the proper functioning of the organism in that state. (For example, a person who has lost a kidney is in a pathological state, even though the norms for proper functioning in this state are the same as for someone with both kidneys.) The pathological must, accordingly, be understood rather as a reduction in the range of circumstances in which an organism can function properly. Correspondingly, health is a state in which an organism is not only able to survive in its current circumstances but is capable of surviving in a significant range of varying circumstances.

Canguilhem emphasizes that, according to his account, biological norms are not objective in any scientific sense. Physiology can describe the states that we call 'normal' or 'pathological', but their normative status as such derives not from the physiological description but from the meaning of those states for the organism. Put another way, biological norms are subjective in the sense that they are constituted by the organism itself. On the other hand, this constitution is not a matter of individual idiosyncrasy but corresponds to the essential nature of the organism in question. Biological norms are not objective in the sense of being derived from value-neutral scientific inquiry, but they are rooted in the biological reality of the organisms that they regulate.

Turning to the question of social norms, such as those Bachelard sees as governing scientific practice, Canguilhem notes that there are important ways in which societies are similar to organisms and that social norms can have the same sort of necessary force that biological norms have. The biological analogy works, however, only for so-called 'traditional' societies, where there is a set of norms that defines, once and for all, the essential nature and purpose of the society. Modern societies have no such 'intrinsic finality', since the question of what should be their fundamental direction is contested in principle. A distinguishing feature of a modern society is dissent regarding basic norms. Canguilhem does not conclude, however, that a consensus, no matter how formed, would legitimately establish norms in a modern society. He criticizes, for example, Thomas Kuhn's account of scientific norms because, in his view, it derives them from a contingent, merely psychological, agreement that has no genuine regulative force. Canguilhem makes a similar criticism of Bachelard, who, he suggests, poses but does not solve the problem of finding a middle ground between grounding scientific norms in the illusion of Cartesian

foundations and reducing them to the merely descriptive realm of empirical psychology. Unfortunately, Canguilhem himself never provides a solution to this problem and, after all the subtlety of his analysis of norms, they are still left without a philosophical basis.

5 Michel Foucault: the influence of Bachelard and Canguilhem

It would be a serious mistake to read Michel Foucault's work as simply another stage of the historical approach to philosophy of science developed by Bachelard and Canguilhem. Foucault is too original a thinker to be confined to any school, and his work is informed by numerous currents far removed from and even opposed to Bachelard's applied rationalism orCanguilhem's history of concepts. But there was considerable influence on Foucault by both Bachelard and, especially, Canguilhem, who supervised his doctoral thesis on the history of madness. Because of this influence some aspects of Foucault's work must be understood in the context defined by these two predecessors.

Foucault accepted many of the key claims of Bachelard and Canguilhem's philosophy of science. These included the essentially historical character of science and the central role of epistemological breaks or discontinuities. On an even deeper level, Bachelard's notion of epistemological obstacle foreshadows Foucault's project of showing the historical, contingent nature of concepts and practices that present themselves as ahistorical necessities. Just as Bachelard spoke of a psychoanalysis of knowledge, Foucault characterized his own work as an effort to discover the unconscious of our knowledge.

Canguilhem's strongest influence on Foucault is through his history of concepts. Foucault employed this approach both as an alternative to what he saw as the excessive subjectivism ('transcendental narcissism') of phenomenology and as a way of de-emphasizing the role of individual 'great minds' in the history of science. *The Birth of the Clinic* (1963) and *The Order of Things* (1966) are particularly influenced by Canguilhem, offering, respectively, a history of the concept of disease in modern medicine and a history of the concept of man in the modern social sciences. The history of concepts is an essential tool of Foucault's famous archaeology of knowledge.

6 Michel Foucault: beyond Bachelard and Canguilhem

Foucault's major differences with Bachelard and Canguilhem can best be understood through two of his most important epistemological distinctions: that between *savoir* and *connaissance* and that between the threshold of scientificity and the threshold of epistemologization. By *connaissance* Foucault means, in accord with standard French usage, any given domain of knowledge, such as biology, economics or philology. *Savoir* he uses to refer to the underlying epistemic conditions that, in a given period, make various domains of *connaissance* (various scientific disciplines) possible. For example, eighteenth-century knowledge (*connaissance*) of natural history was, according to Foucault, based on a fundamental conception of natural entities as representable through tables of timeless genera and species. In the nineteenth century, he maintains, the new discipline (*connaissance*) of biology was, on the contrary, based on the fundamental concept of the organism as an essentially historical entity (see Taxonomy §1). Such fundamental concepts belong to what Foucault calls *savoir*. They correspond to the 'unconscious' of knowledge that his archaeological method is designed to excavate.

From Foucault's standpoint, Bachelard and Canguilhem treat science only at the level of *connaissance*. They take as givens the bodies of knowledge produced by scientific disciplines and remain unaware of the epistemic realm of *savoir* that underlies this knowledge. This prevents them from discerning the common ground between apparently diverse sciences (for example, the epistemic structure - in Foucault's terminology, *episteme* - shared by modern biology and economics). It also keeps hidden important connections between scientific and nonscientific forms of knowledge.

Foucault distinguishes (in *The Archaeology of Knowledge*, 1969) four thresholds in the development of a body of knowledge. At one extreme is the threshold of positivity (the initial emergence of an autonomous body of discourse) and at the other the threshold of formalization (formulation in axiomatic terms). Between these two are the thresholds of epistemologization and of scientificity. The threshold of epistemologization is crossed when a body of discourse (what Foucault calls a 'discursive formation') comes to be governed by epistemic norms that provide criteria (logical coherence, support from observed facts) for evaluating knowledge claims. The threshold

of scientificity is crossed when these norms are extended to include the specific principles of a scientific methodology. Such principles introduce a kind of rigour and precision far beyond that of ordinary discourse and define the special form taken by scientific objectivity.

Foucault's studies of science, in contrast to those of Bachelard and Canguilhem, deal with *savoir* rather than *connaissance* and operate on disciplines that have passed the threshold of epistemologization but not that of scientificity. The 'epistemological history' of Bachelard and Canguilhem begins with disciplines well-established as scientific and reflects only on the methodological and empirical content of their concepts and theories. As a result, Bachelard and Canguilhem simply accept the norms of current science as given and use them to evaluate the content of earlier science as well as the content of nonscientific discourses (for example, poetry or ideology) insofar as the latter implies a description of the natural world. By focusing on the *savoir* presupposed by scientific concepts and theories and on disciplines, such as psychiatry and the human sciences, that are not fully entrenched as scientific, Foucault is able to study scientific norms as the products of historical processes. Canguilhem (1967), reviewing *Les mots et les choses* (Foucault 1966), wrote that ' there is today no philosophy less normative than that of Foucault'. This is true in the sense that Foucault, unlike his two predecessors, writes the history of scientific (or would-be scientific) disciplines without presupposing the norms of these very disciplines. On the other hand, Foucault's archaeological analysis of science is fundamentally concerned with norms, in the sense of understanding their precise role in the historical development of scientific practices.

What might Foucault's approach contribute to the problem of the objectivity of scientific norms? His contribution is not so much a solution as a transformation of the problem. The issue, he suggests, is not how to provide a philosophical basis for objective norms. There is nothing outside of a given scientific community and its practices that can intelligibly underwrite its objectivity. A widely accepted, successful and enduring scientific enterprise has, of itself, *prima facie* status as a source of objective knowledge. But although scientific claims cannot, and need not, be grounded by philosophical argument, they can be undermined by the special sort of historico-philosophical inquiry that Foucault practised in his historical studies. Specifically, a careful untangling of the structure of the *savoir* underlying a given discipline and a tracing of the historical development of this structure can demonstrate the arbitrariness or contingency of principles that the discipline presents as objectively necessary. Foucault's studies of psychiatry (in *The History of Madness*), of criminology and related disciplines (in *Discipline and Punish*), and of the modern 'sciences' of sexuality (in the first volume of *The History of Sexuality*) are all attempts at such demonstrations.

Foucault's critiques are not intended as rejections of scientific objectivity as such. He is concerned with only specific disciplines and never, for example, subjects physics or chemistry to his critique. Moreover, his critiques never conclude that the discipline under scrutiny entirely lacks objective validity. Even the modern psychiatry that he denounces with such virulence in *The History of Madness* he acknowledges to have a certain validity. This eschewal of global scepticism is just the inverse of his rejection of foundationalism. Doubting everything and justifying everything are both totalizing epistemological enterprises entirely contrary to the spirit of Foucault's work (see Foundationalism; Objectivity).

7 Michel Serres

Michel Serres is even less a disciple of Bachelard and Canguilhem than Foucault. Nonetheless, there are important ways in which his work is a continuation and transformation of theirs. Like Bachelard, Serres emphasizes the dispersed, regional character of scientific work. Each domain is like a Leibnizian monad, with a life and intelligibility of its own. (The comparison to Leibniz is far from superficial. Serres wrote his thesis on the Leibnizian system, and his subsequent work can very fruitfully be read as a twentieth-century reformulation of Leibniz's philosophy.) But, like Foucault, Serres sees also a structural unity that connects independent scientific domains. He explicates this unity in terms of the concept of communication, which he employs as a formalized and secularized version of Leibniz's pre-established harmony (see Leibniz, G.W. §6; Unity of science). Serres also goes much further than Canguilhem and Foucault in questioning Bachelard's sharp demarcation of science from nonscience. He maintains that domains conventionally regarded as nonscientific, such as art and literature, share the structures of scientific disciplines and must be regarded as their epistemic peers. In this regard, Serres makes some particularly striking claims; for example, that Emile Zola discovered thermodynamics before it was explicitly formulated by physicists.

Serres's own writings are an often disconcerting - but also stimulating - mixture of the philosophical and the artistic. He tries to show the structural identity of Descartes' *Meditations* and La Fontaine's fables, argues that 'Turner translates Carnot', and presents Lucretius' *De Rerum Natura* as a contribution to twentieth-century physical theory. His style correspondingly combines close philosophical analysis with poetic evocation; casual readers may be in doubt as to whether they have picked up a philosophical treatise or a prose poem. Serres would, of course, maintain that such apparent incongruities simply reflect the limitations of conventional intellectual categories and that the pursuit of truth requires violating artificial disciplinary boundaries.

8 Conclusion

The history of French philosophy of science in the twentieth century is a history of the radicalization of Bachelard's insight that science and our philosophical reflection on it are historical phenomena. Bachelard's original formulations try to make this insight consistent with traditional views of the autonomy, progressiveness and normativity of scientific knowledge. Canguilhem, Foucault and Serres in turn raise fundamental questions about the viability of such views in the face of a full acceptance of the historicality of science. The issues emerging from this line of development parallel those familiar to Anglo-American philosophers of science in the years since Thomas Kuhn's *The Structure of Scientific Revolutions*. Like Bachelard, Kuhn (writing over twenty-five years later) tried to take seriously the historical nature of science while still maintaining traditional views about its epistemic status. Post-Kuhnian discussions, from Feyerabend through late twentieth-century sociology of science, have raised questions very similar to those posed by Bachelard's successors. Despite formidable obstacles, both rhetorical and conceptual, there is much that each of these traditions could learn from the other.

Freud, Sigmund (1856-1939)

Freud developed the theory and practice of psychoanalysis, one of the most influential schools of psychology and psychotherapy of the twentieth century. He established a relationship with his patients which maximized information relevant to the interpretation of their behaviour, and this enabled him to find explanations of dreams, symptoms and many other phenomena not previously related to desire. In consequence he was able radically to extend our common-sense psychology of motive.

On Freud's account everyday actions are determined by motives which are far more numerous and complex than people realize, or than common-sense understanding takes into account. The most basic and constant motives which influence our actions are unconscious, that is, difficult to acknowledge or avow. Such motives are residues of encounters with significant persons and situations from the past, often reaching back to early childhood; and they operate not to achieve realistic satisfaction, but rather to secure a form of pacification through representation. When we interpret what others say and do we apply these patterns of satisfaction and pacification to explain their behaviour; and in so far as we succeed in understanding others in this way we support the patterns as empirical generalization. While we recognize that pacification consequent on genuine satisfaction is deeper and more lasting than that effected by representation alone, we also know that human desire outruns opportunities for satisfaction to such an extent that pacification via imagination is common. This is a view which psychoanalysis radically extends.

This understanding of the mind enabled Freud to give psychological accounts of neurosis and psychosis, and to explicate how the past gives significance to the present in normal mental functioning. Past desires, even those of infancy, are not psychologically lost; rather they are continually re-articulated through symbolism, so as to direct action towards their representational pacification throughout life. In this Freud provides both a radically holistic account of the causation of action and a naturalistic description of the generation of meaning in life. New goals acquire significance as representatives of the unremembered objects of our earliest and most visceral passions; and the depth of satisfaction we feel in present accomplishments flows from their unacknowledged pacification of unknown desires from the distant past. Thus, paradoxically, significant desires can remain forever flexible, renewable and satisfiable in their expressions, precisely because they are immutable, frustrated and unrelenting at the root.

1 Early life and research

Freud was born in Freiburg, Moravia, the first son of the third wife of a travelling wool merchant. In 1861, the year after Austria abolished legal restrictions on Jews, the family settled in Vienna, where Freud remained until the Nazi occupation. As a student at the Medical School of the University of Vienna he attended lectures by the physiologist Ernst Bruke, which set out the Darwinian and physicalistic approach to nature associated with the school of Helmholtz. Shortly afterwards Freud began research in Bruke's laboratory, and within a year published the first of many articles on the nervous system.

On becoming engaged Freud found that he could not support a family through neurological research. He prepared for medical practice at the General Hospital of Vienna, working also in Meynert's Institute of Cerebral Anatomy. His publications on disorders of the nervous system led to an appointment as Lecturer in Neuropathology, and in 1885 he was awarded funds to study in Paris under Charcot, whose work on hysteria included the use of hypnosis for producing and removing symptoms. Here Freud made his first characteristic psychological observation, noting that the regions of the body liable to hysterical paralysis or anaesthesia did not correspond to real functional demarcations. Hysteria, it seemed, knew nothing of anatomy.

2 Collaboration with Breuer

Freud's psychoanalytic work was based on a discovery by his senior colleague Joseph Breuer. Breuer's patient Anna O, diagnosed as hysterical, was an exceptionally intelligent and articulate woman, who enquired with him into her symptoms in great detail. They found that each symptom had meaningful connections with significant but forgotten events, related to feelings which she had neither expressed nor mastered. When she recovered these her symptoms were eased. Thus one symptom was an aversion to drinking: despite 'tormenting thirst', she would

push away a glass of water 'like someone suffering from hydrophobia' (Freud 1953-74: vol. 2, 34). Under hypnosis she traced this to an episode in which she had remained silent while a companion let a dog, a 'horrid creature', drink water from a glass. After reliving this and expressing her disgust she drank without difficulty. Again, a range of symptoms - hallucinations, paralyses and disturbances of speech - were similarly related to experiences which had distressed her while she nursed her father in his terminal illness; when she went through these with Breuer the symptoms were relieved.

The research of Charcot and others had indicated that hysterical symptoms could be understood in psychological terms, and were sometimes related to emotional trauma. Although Breuer's patient relapsed before finally recovering, his observations suggested two further more specific hypotheses: first, that symptoms expressed memories and feelings associated with significant forgotten events; and second, that symptoms could be relieved by a cathartic therapy, which enabled patients to relive these events, thereby working through feelings connected with them. So Freud followed Breuer's example, and began questioning his patients about their lives and feelings in great detail. In this he abandoned hypnotism, and for a time substituted a technique, derived from Bernheim, of pressing patients to remember significant events. His experience corroborated Breuer's sufficiently for them to publish a series of case reports arguing that 'hysterics suffer mainly from [unconscious] reminiscences' (Freud 1953-74: vol. 2, 7).

3 Investigation of sexual abuse

As his research progressed, Freud found that an important range of the memories connected with symptoms were sexual, and went back in time. Under the pressure of his technique, indeed, a number of his patients recovered apparent memories of sexual abuse from early childhood. As he pressed further, in a series of female patients, the role of abuser was consistently assigned to the father. (This experience has been repeated by a number of therapists in the USA.) In considering these scenes of seduction, however, Freud finally concluded that while parental abuse could be a factor in causing neurosis, it was not as widespread as suggested by the readiness of patients to recollect it. For, as he noted, there seemed to be 'no indications of reality in the unconscious', so that 'one cannot distinguish between truth and [emotionally charged] fiction', where this could include 'sexual fantasy [which] seizes on the theme of the parents' (Freud 1953-74: vol. 1, 260; also see Masson 1985: 265). Hence, it seemed, the primary cause of symptoms might be found in activity of the imagination.

These events also led Freud to change his therapeutic technique. It had became apparent both that he had to guard against effects of suggestion, and also that the most relevant and reliable material tended to emerge not when patients were pressed for memories, but rather when they expressed their thoughts and feelings spontaneously. So he began asking his patients simply to communicate each idea or thought which occurred to them as fully as possible, and without regard to whether it seemed significant, sensible or morally acceptable. This kind of immediate and unconstrained self-description, which Freud called free association, led both to the topics previously found important by questioning, and to others not yet investigated. Since this procedure maximized the data relevant to understanding his patients, Freud made it the fundamental rule of psychoanalytic treatment (see Unconscious mental states).

4 Dreams and wish-fulfilment

During this period Freud observed that dreams, like symptoms, could be understood as related to memories and motives which emerged in free association. In investigating dreams, moreover, he could make use of his own case. He thus began his self-analysis, applying to himself the interpretive techniques which he applied to his patients. As this progressed, Freud saw that his and Breuer's findings about symptoms were better understood on the model that he was developing for dreams. In consequence he was able to frame an account of both dreams and symptoms which was relatively simple and unified, and which he published in *The Interpretation of Dreams* (1900). Further, as he soon saw, this account could be extended to other products of the mind, including slips and errors, jokes and works of art.

Freud's discussion of dreams thus constituted a paradigm by which he consolidated his first phase of psychoanalytic research. We can see some main features of this by considering the first dream he analysed, his own dream of Irma's injection. In this dream Freud met Irma, a family friend whose pains he had diagnosed as hysterical and treated by analysis. He told her that if she still felt pains, this was her own fault, for not accepting

his ‘solution’ to her problems. He became alarmed, however, that he had failed to diagnose an organic cause of her suffering, and this turned out to be so. A senior colleague, M, examined Irma, and found that she was organically ill. The cause of her illness also became manifest: another of Freud’s colleagues, his family doctor Otto, had given her a toxic injection. As the dream ended Freud censured Otto firmly, saying, ‘Injections of that kind ought not to be made so thoughtlessly’ and ‘probably the syringe had not been clean’.

On the surface this dream dealt with topics which were unpleasant to Freud, such as the continued suffering of a friend and patient, and the possibility that he had misdiagnosed an organic illness, which he described as ‘a constant anxiety’ to a doctor offering psychological therapy. Freud’s associations, however, made clear that the dream represented these things in a way which was actually in accord with various of his desires or wishes. For Freud remembered that on the day before the dream he had discussed Irma with Otto, who had recently visited Irma’s family. Otto had been called away to give an injection while at Irma’s, and had told Freud that Irma was looking ‘better, but not yet well’. Freud imagined that he detected a professional reproof in this remark, considered it thoughtless, and felt vaguely annoyed. That night, in order to justify his treatment of Irma, he had started to write up her case to show to M, who was respected by both himself and Otto, and who appeared in the dream as diagnosing Irma’s illness and realizing that it was Otto’s fault. (Also, as it happened, Freud had just had news indicating that another of his female patients had been given a careless injection by some other doctor, and had been contemplating how safe his own practice with injections was.)

In considering this dream Freud noted that his desire to justify himself in respect of Irma’s case - and in particular not to be responsible for her continued suffering - was apparent from the beginning, in which he told Irma that her pains were now her own fault. Also, he felt that his alarm at her illness in the dream was not entirely genuine. So, as he realized, it seemed that the dream-situation, in which Irma was organically ill, actually served to fulfil a wish on his account: for as he undertook to treat only psychological complaints, this would mean that despite what he had taken Otto thoughtlessly to imply, he and his mode of treatment could not be held responsible for Irma’s continued illness. This theme, moreover, seemed carried further in the rest of the dream, in which M found that Otto, not Freud, bore responsibility for Irma’s suffering. It thus emerged that the dream could be seen as a deeply wishful response to Otto’s remark. For as the dream represented matters, Freud bore no responsibility whatever for Irma’s condition. Rather, Otto was the sole cause of her suffering; and this was the result of Otto’s thoughtless practice with injections, a matter about which Freud himself, as he had been considering, was particularly conscientious and careful. The dream thus repaid what Freud felt to be Otto’s professional reproof with a charge of serious malpractice on Otto’s part. So Freud concluded that the dream was a wish-fulfilment, that is, that it was caused by certain of his desires (or irresponsible wishes derived from these desires) and expressed these by representing them as fulfilled.

We can bring out the nature of Freud’s proposal here by contrasting the way his desire to be clear of responsibility for Irma’s suffering operated in his dream as opposed to his intentional action. Schematically, the role of a desire that P in intentional action is to bring about (cause) a situation that P, which both satisfies the desire and pacifies it, that is, causes the desire to cease to operate. Action on a desire that P (that one be cleared of responsibility) should ideally satisfy the desire, that is, should bring it about that P (that one is cleared of responsibility). This, in turn, should cause one to experience and believe that P (that one has been cleared of responsibility); and this, perhaps acting together with the satisfying situation, should pacify the desire that P, so that it ceases to govern action. This is roughly the sequence of results which Freud was seeking to produce, in accord with standard medical practice, in writing up Irma’s case history on the night of the dream to discuss with M, his respected senior colleague. M would be able to offer an independent and authoritative opinion on Freud’s treatment of Irma; so his judgment could partly serve to put Freud, and his mode of therapy, in the clear.

In Freud’s dream the same motive was apparently also at work, but in a quite different way. There it produced no rational action, but rather gave rise to a (dreamt) representation of a situation in which Freud was cleared of responsibility, and by M. This representation, moreover, was extravagantly wishful - Irma was made physically ill, Freud was cleared in a great number of ways, Otto was elaborately blamed, and so on. So we can contrast the causal role of desire, as between intentional action and what Freud called wish-fulfilment, as follows. In intentional action a desire that P serves to bring about a situation that P, and this a (justified and true) belief that P, so that the desire is pacified. In Freudian wish-fulfilment, by contrast, the desire that P causes a wishful representation that P which, although perhaps exaggerated and unrealistic, is experience- or belief-*like*, so that it

serves to pacify the desire directly, at least temporarily. So in rational action we find both the real satisfaction and also the pacification of desire, with the latter a rational and causal consequence of the former; whereas in wish-fulfilment we find only imaginary satisfaction, and the pacification which is consequent on this.

It seems intelligible that the mind (or brain) should operate in accord with both these patterns, for in both desire is ultimately pacified by the representation of satisfaction. On reflection, indeed, the latter pattern seems almost as familiar as the former. We are aware that our response to a desire or lack is often simply to imagine it satisfied; and this process seems clearly to have other forms. Children, for example, often pacify desires which arise from their being small and immature by representing themselves as various sorts of admired or impressive figures in play. Also it seems clear that many books, films, video games and so on enable people to imagine gratifying desires which they could not (and often would not) otherwise satisfy. In such cases we speak of make-believe, suspension of disbelief and virtual reality, thereby indicating the way the kind of representation involved is comparable to experience or belief in serving to pacify desire (see Action; Desire).

5 Transference, childhood conflict and sexuality

Freud found that the motives expressed in dreams and symptoms could be retraced to the past. Also, he noted that in the course of analysis his patients were liable to experience towards himself versions of motives and feelings which they had felt towards earlier objects of love and hate, in particular their parents. Freud called this phenomenon ‘transference’. Thus a main symptom of his patient the Rat Man was involuntarily to imagine his father being punished, by being eaten into from behind by hungry rats. This caused him anxiety and depression, from which he protected himself by the rituals of an obsessional neurosis. He insisted that this symptom did not show hostility towards his father, with whom he had been the best of friends. He could not remember his father having punished him; but as the treatment progressed, he developed a fear that Freud would punish him - would beat him and throw him out because of the dreadful things he said in his free associations.

In discussing these matters with Freud the patient went down to the end of the room, saying that he did so from delicacy of feeling for Freud, to whom he was saying such dreadful things. Freud interpreted, however, that he had moved away because, as he had previously been saying, he was afraid that Freud would beat him. To this he responded like ‘a man in desperation and one who was trying to save himself from blows of desperate violence; he buried his head in his hands, rushed away, covered his face with his arms, etc.’ (Freud 1953-74: vol. 10, 284). He was reliving an episode from his childhood, in which, while lying between his parents in bed, he had urinated, and his father had beaten him and thrown him out. He thus recovered a buried image of his father as a terrifying, punishing figure in relation to whom he felt helpless and hostile. This in turn made it possible to understand his involuntary imaginings, in which his father suffered such cruel punishments, as wish-fulfilments fitting the same pattern as Freud’s dream above. Just as Freud’s dream could be seen as a wishful and extravagant reversal of the feelings of responsibility prompted by Otto’s remark, so this patient’s symptom of imagining his father cruelly punished could be seen as a wishful and extravagant reversal of his own feelings as a punished child. But these childhood feelings were re-experienced towards Freud in the transference before being consciously remembered as relating to his father.

The childhood motives revealed by analysis characteristically included sensual love for one parent combined with rivalry and jealous hatred for the other, a constellation Freud called the ‘Oedipus complex’. It now appeared that little children were liable to intense psychical conflict, as between desires to harm or displace each parent, envied and hated as a rival for the love of the other, and desires to preserve and protect that same parent, loved sensually and also as a caretaker, helper and model. Further, children apparently attached great emotional significance to their interactions with their parents in such basics of disciplined and cooperative activity as feeding and the expulsion and management of waste. These activities also involved the first use, and hence the first stimulation, of bodily organs or zones - particularly the mouth, genitals and anus - which would later figure in the emotionally significant activities of normal and abnormal sexuality. Analysis indicated that the feelings related to the early uses of these organs had significant continuity with those aroused by their later uses; and on this basis Freud framed an account which systematically linked normal and abnormal sexual phenomena in the development of the individual.

In normal development, weaker and less acceptable childhood feelings were subjected to a process of repression, which removed them from conscious thinking and planning, so that they could achieve pacification only indirectly. Apart from causing dreams or symptoms, such motives could undergo a process of sublimation, whereby they

provided symbolic significance for everyday activities, and could thus be pacified in the course of them. This achievement can be illustrated by a relatively successful teacher and writer, who had been surprised when one of his pupils - who had made a special effort to be taught by him, and was trying hard to master his ideas - had unexpectedly offered to suck his penis. He had not accepted this offer, but that night dreamed that a lamb had come to suck milk from his finger. On waking he realized that the lamb represented the pupil who had come to imbibe his ideas, and his milk-giving finger the penis his pupil had wanted to suck. So the dream could be seen as representing the fulfilment, in a more acceptable and symbolic form, of a sexual wish which had arisen on the day before.

The symbolism, however, went deeper, for the dreamer also represented himself as a mother nursing a child. In this he represented his finger/penis in the role of a feeding breast, and his writing and teaching as the production of milk as well as semen. He thus represented himself as enjoying a combination of feminine nurture and masculine potency which was impossible in real life, and his desires for which had been repressed in early childhood. Still, these same desires could to some degree be pacified in his adult work, owing to the symbolic significance which he attached to it. In writing or teaching he could with some justice see himself - to use more familiar metaphors - as potent and seminal, and at the same time as giving others food for thought.

6 Fantasy and primary process

Psychoanalysts now commonly describe the kind of imaginative representational activity which serves to pacify unconscious desire as fantasy. Fantasies can be shown not only in dreams or symptoms, but any form of activity which has representational significance; and fantasies characteristically realize the psychological mechanisms and processes described in psychoanalytic theory. Thus the fantasy of Freud’s patient above - that Freud was about to give him a beating - simultaneously implemented his transference onto Freud of emotions originally felt towards his father; the repression of his memory of an episode in which his father had punished and terrified him; and the projection into Freud of his own desire to punish, which was apparently related to the episode with his father, and otherwise expressed in his symptom of imagining his father punished. Again, persons form permanent life-shaping fantasies of themselves on the model of others, thereby establishing identifications with those persons, which process Freud took to be central to the constitution of the self.

Freud held that the pattern of wish-fulfilling representation, in which a desire that P produces a pacifying (and perhaps symbolic) representation that P, marks a primary process in the pacification of desire, whereas the pattern of intentional action, in which a desire that P gives rise to a real action or situation that P, marks a secondary process, to be seen both as developing from the first and occurring in the context of it. We can understand this as the claim that present action characteristically stands in a representational and pacificatory relation to desires from the past. Thus Freud’s patient above consciously desired to go to the end of the room partly in response to his unconscious fantasy that Freud, representing his father, was about to beat him; and the author who dreamed of a sucking lamb consciously desired to teach and write partly because these activities unconsciously realized fantasies of taking the role of a feeding mother. That is to say, a person acting in the present may thereby be representing himself as satisfying, and so may thereby now actually be pacifying, desires which have remained unsatisfied from early childhood.

7 Psychology and the brain

Freud’s initial research was on the nervous system, and in his *Project for a Scientific Psychology* (1895) he sketched a version of physicalism - an account of psychological processes as neural processes - which could accommodate his psychological findings. He took the brain to operate by transferring excitation through networks of neurons, so that information was stored in the form of facilitations or inhibitions of the interneural links. Hence, as he put it, ‘psychic acquisition generally’, including memory, would be ‘represented by the differences in the facilitations’ of neural connections (Freud 1953-74: vol. 1, 300). In this he anticipated the contemporary conception of the brain as a computational device whose knowledge is ‘in the connections’ among neuronal processing units, and also the associated view of mental processes as forms of neural activation, and mental states as dispositions to these, or structures determining them (see Glymour 1992; Connectionism).

In Freud’s model the signalling of a bodily need - say, for nutrition in an infant - causes a disequilibrium in neural excitation. This at first results in crying and uncoordinated bodily movements, which have at best a fleeting

tendency to stabilize it. Better and more lasting equilibration requires satisfaction, for instance, by feeding; and this causes the facilitation of the neural connections involved in the satisfying events. The brain thus constantly lays down neural records, or prototypes, of the sequences of perceptions, internal changes, bodily movements and so on, involved in the restoration of equilibrium by satisfaction. Then when disequilibrium again occurs - such as when the infant is again hungry - the input signals engage previously facilitated pathways, so that the records of the best past attempts at coping with comparable situations are naturally reactivated. This, Freud hypothesized, constitutes early wish-fulfilment.

Freud thus identified the wish-fulfilling pacification of infantile proto-desire with a form of neural prototype activation (see Churchland 1995). He took it that this served to stabilize and organize the infant's responses to need, by reproducing those previously associated with satisfaction. Then, as the infant continued to lay down prototype upon prototype, the original wishful stabilizations evolved towards a system of thought, while also coming to govern a growing range of behaviour, increasingly coordinated to the securing of satisfaction. This, however, required the brain to learn to delay the activation of prototypes of past satisfactions until present circumstances were perceptually appropriate - that is, to come into accord with what Freud called the reality principle. This in turn depended upon a tolerance of frustration, and the absence of a satisfying object, which permitted reality-testing, and hence the binding of the neural connections involved in the securing of satisfaction to perceptual information about the object, and later to rational thought. This benign development could, however, be blighted, if frustration (or intolerance of it) led to the overactivation of inappropriate prototypes, and this to greater frustration. Such a process could render the mind or brain increasingly vulnerable to disequilibrium and delusion, and hence increasingly reliant on wish-fulfilling modes of stabilization, in a vicious circle constitutive of mental illness.

8 Psychic structure and function

Freud allocated the task of fostering the sense of reality to a hypothetical neural structure, or functional part of the mind, which he called 'das Ich', or the *ego*. (The literal meaning of Freud's phrase is 'the I'; but the Latin pronoun used in the English translation has now acquired a life of its own.) In his final conceptualizations he linked this structure with two others, the 'super-ego', which judged or criticized the ego, and which included the ego-ideal, representing the ideals or standards by which the ego was judged; and the primitive 'it', or *id*, the natural matrix of basic and potentially conflicting instincts or drives - that is, structures which would yield basic emotions and motives for action - out of which these others developed. His late discussions of these notions are particularly difficult, partly because they combine differing modes of explanation.

Overall the ego, super-ego and id are neural systems described in a functional way, that is, in terms of the goals which their operation secures and the information upon which they operate. This kind of explanation has been refined in contemporary cognitive science, in which distinct functional units are often represented by boxes, in a flow chart which describes the contribution of each boxed unit to psychological functioning overall. In his later work Freud sought to combine this mode of explanation with the empirical claim that the main functional systems of the human mind are partly constituted by the mind's internalized representations of significant persons in the environment, particularly the parents. Hence the working of these systems is partly felt, and can partly be described, via the motives, feelings or actions of the imagos of persons which they embody (see Functionalism).

Freud took the drives constituting the id as divisible into two main categories: those which engender motives which are creative and constructive, such as affection, love and care, which he called the life instincts; and those which yield motives linked to aggression, such as envy and hate, which he called the destructive or death instincts. The sexual drives (or motives), together with those aimed at self-preservation, were among the life instincts generally; but owing to their great plasticity they were liable to be mixed with aggression, as in the case of sadism, masochism, devaluation of the object of love, and so on. His final view was thus that the primary conflicts in a person's life - those which necessitated repression and could become constitutive of mental illness - might involve sexuality, but were ultimately to be seen as holding between impulses to create or destroy.

On Freud's account the ego and super-ego develop out of the id, mainly through the child's formative identifications with others, particularly the parents. The child ordinarily begins to advance towards self-control by laying down prototypical images of the parents, in their role as regulators of socially significant primitive bodily activities, particularly, as noted, those involved in feeding and the elimination of waste. These 'earliest parental

imagos' (Freud 1953-74: vol. 22, 54) provide the basis of the super-ego. This self-critical faculty embodies the child's aggression in a projected form, and so tends to be far more punitive than the actual parents. Hence it can be a source of great anxiety or guilt, or even, in the extreme, of suicide. (Compare the material in §5 above, which might also be described as involving projection of the patient's punitive super-ego.)

The child further constitutes its ego by identifying with the parents as agents, that is, as desirers and satisfiers of desire. A main step in normal development is identification with the parent of the same sex, which has the consequence that sexual (and other) desires are rendered non-incestuous, heterosexual and reproductive. For this to occur, however, the child must renounce the goal of replacing the envied parent with that of becoming like him or her. Hence the final establishment of the ego and super-ego coincides with what Freud called the dissolution of the Oedipus complex.

9 Social psychology

Freud held that the cohesiveness of many groups results from their members identifying with one another by putting a common idealized figure (or cause or creed) in the place of the ego-ideal. Groups may likewise be identified by the projection of their bad aspects - and in particular their own hostile and destructive motives - into some common locus, which thereby becomes a focus of collective and legitimated hate. This may be a particular figure, such as the devil, or another family, race or nation, the leaders of which may also be denigrated or demonized.

People who identify themselves with the same idealized object, or who represent a common object as hateful, can thereby feel purified, unified and justified in cooperating in destructive activities validated by common ideals. Identification by the projection of good or bad aspects into a common locus thus serves systematically to organize persons into groups which represent themselves as unrealistically good and others as unrealistically bad; and this in turn allows aggressive and destructive motives to be entertained and satisfied with a minimum of indirectness and guilt. This pattern of good us/bad them is shared by most participants in the great variety of human conflicts which it encourages. Where groups are organized on this basis their rational disagreements tend to be underpinned and exaggerated by suspicions and hatreds which can be seen to be irrational, but which remain none the less intractable, in so far as they are integral to group cohesion.

List of works

Freud, S. (1953-74) *The Standard Edition of the Complete Psychological Works of Sigmund Freud*, trans. and ed. J. Strachey *et al*., London: Hogarth Press, 24 vols.(The standard English edition of Freud's works.)

Freud, S. (1979) *The Pelican Freud Library*, Harmondsworth and New York: Penguin.(A slightly abridged version, this omits Freud's original case notes on the Rat Man, from which the description of treatment in §5 is taken.)

Freud, S. (1895) *Project for a Scientific Psychology*, in Freud 1953-74: vol. 1, 283-.(Freud's physiological hypotheses about the mind, sketched but not published while he was formulating his account of dreams. He took mental processes to be realized by the passing of excitation through networks of neurons, which also altered neural connections so as to store information for later use. The mind/brain thus naturally laid down neural records of its activities relating to the satisfaction of desire, and these prototypes were automatically reactivated so as to guide action, and receive further modification, in comparable situations later. Freud expressed a number of his basic ideas in these terms, and his later discussions are consistent with them.)

Freud, S. (1900) *The Interpretation of Dreams*, in Freud 1953-74, vols 4-5.(Freud's account of dreams and symptoms as wish-fulfilments, that is, as serving to pacify desires by representing them as satisfied. Freud later applied this paradigm to other kinds of representation, and extended it to everyday intentional action through his account of the sublimation of infantile sexual and aggressive desires. These hypotheses explain present desires by mapping them to objects and situations desired in the past, and hence in accord with the role assigned past neural prototypes in the Project.)

Friendship

Philosophical interest in friendship has revived after a long eclipse. This is due largely to a renewed interest in ancient moral philosophy, in the role of emotion in morality, and in the ethical dimensions of personal relations in general. Questions about friendship are concerned with issues such as whether it is only an instrumental value (a means to other values), or also an intrinsic value - a value in its own right; whether it is a mark of psychological and moral self-sufficiency, or rather of deficiency; and how friendship-love differs from the unconditional love of agapē*. Other issues at stake include how - if at all - friendship is related to justice; whether the particularist, partialist perspective of friendship can be reconciled with the universalist, impartialist perspective of morality; and whether friendship is morally neutral.*

1 Ancient philosophy

Ancient moral philosophy devoted considerable attention to understanding friendship (*philia*) and passionate love (*eros*) (see Love §§2-3). In its widest sense, *philia* covers both amicable relations among casual acquaintances, and intimate, loving relationships within and beyond the family. Plato's *Lysis* is the first serious philosophical treatment of friendship, and sets the stage for subsequent treatments. The dialogue is largely inconclusive, but some of the claims made in it re-emerge in Plato's later dialogues: we love people, like other objects of love, because of some lack in ourselves, and we love them only in so far as they are useful in pursuing our final end or *eudaimonia*, achieved with knowledge of Goodness (see Plato; Eudaimonia). Thus, the notion of friendship as an enduring and reciprocal love between equals, and as a mark of self-sufficiency rather than deficiency, remains absent from Plato's account.

These lacunae are made good in Aristotle's writings. A flourishing (*eudaimōn*) human life, a life that is complete and self-sufficient (lacking in nothing), includes friendship - reciprocal affection and goodwill - because human flourishing is relational. People can be loved for their pleasure- or utility-value, or for their good character; accordingly, there are pleasure-friendships, utility-friendships and character-friendships. Character-friendships include pleasure and utility, because good character is both pleasurable and useful. Here friends love (*philein*) each other for who they are, their character, and 'not coincidentally' (*Nicomachean Ethics* 1156b11-12); hence, they wish each other 'to be' and to flourish for their own sakes (1166a3-20). Character-friendship requires virtuous activity, and a choice (*prohairesis*) of 'another self' (1170b6-7). Such a choice presupposes genuine self-love, which only virtuous people possess; hence, only they can choose another self. Moreover, virtue is best exercised in pleasurable and beneficial activities with and towards friends, so it is virtuous people who most *want* friends.

A much-discussed problem in Aristotle's account is that he first makes non-instrumental concern - goodwill - a distinguishing feature of *all* friendships (1155b29-1156a5), but subsequently restricts it to character-friendships (1156b10-11, 1167a11-14). He does not attempt to reconcile these claims; nor does he explain *why* we cannot have goodwill towards utility- or pleasure-friends, given his belief that we *can* towards strangers. So perhaps we should take Aristotle to mean simply that active and *enduring* goodwill is found only in character-friendships.

Aristotle also discusses friendship in the wider sense of relations of mutual goodwill and justice among people, including strangers. The general claim is that friendship, justice and community are coextensive, and so all humans capable of community, including slaves, have a sort of friendship with each other (1159b25-30, 1161b6). This belies the widespread view that Aristotle's ethics is parochial. Also noteworthy is Aristotle's insistence that the claims of justice increase with the closeness of the friendship, a claim that runs contrary to many contemporary depictions of friendship as being 'beyond justice' (see Aristotle §25).

The Aristotelian idea that noninstrumental concern is essential to friendship is central to Hellenistic accounts of friendship, though sometimes uneasily so. Thus, Epicurus recognizes friendship as an intrinsic good which necessarily involves loving our friends as we love ourselves, yet insists that every act of friendship must aim at our *eudaimonia* (see Mitsis 1988). But this insistence, conjoined with his conception of *eudaimonia* as a static end-state of unhindered pleasure (*ataraxia*, tranquillity), rather than as pleasurable activity, makes friendship simply instrumental to *eudaimonia*, and so not an intrinsic good. Another problem arises from Epicurus' conception of *eudaimonia* as invulnerable and up to us (*par' hemas*). *Eudaimonia* is achieved through a rational control of the strength and range of one's desires, a control that makes it relatively immune to chance. But what if

the desire that one's friend live and flourish is frustrated? Epicurusmust either insist that we can and should eliminate such desires in the interests of *eudaimonia*, thereby rendering his conception of friendship rather shallow, or acknowledge that *eudaimonia* is not entirely *par' hemas* or invulnerable (see Epicureanism §11).

Laelius, De amicitia (Laelius: On Friendship) by Cicero (106-43 BC) was largely responsible for transmitting Aristotle's conception of friendship to Christian philosophers, notably St Augustine (354-430) and Aelred of Rievaulx (1109- 66), exemplifying his aim of using rhetoric to disseminate philosophical ideas (see Cicero §§4-5). Building on Aristotle's account, Cicero stressed the internal component of self-sufficiency - a sense of security and self-confidence - as a necessary condition of friendship, and made explicit the centrality of mutual respect in perfect friendship, a factor only implicit in Aristotle. In addition, he emphasized rationality by the admonition to base friendship on careful observation and occasional testing of a person's character, and continual self-scrutiny.

2 Medieval Christian philosophy

Friendship raises new questions and problems in the context of the Christian conception of perfect love, *agapē* or charity (see Charity; Love §2). For *agapē* is universal and unconditional, directed at saint and sinner alike, whereas friendship is preferential and conditional on the friend's goodness (see Universalism in ethics). Does not the exclusiveness of friendship, then, contradict the inclusiveness of *agapē*? Augustine's answer is 'no', so long as we recognize that friendship is a gift of divine *agapē*, and use it - like all earthly loves - as a means to perfect love for God, the only love to be enjoyed for its own sake. To love persons as ends is to seek infinite satisfaction in them, and this is idolatory, a violation of the commandment of total devotion to God. As in Plato, so in Augustine, personal love ultimately seeks, and finds satisfaction in, a good that transcends any earthly good (see Augustine §12).

Not all Christian philosophers, however, see personal love as a mere means to a divine end. Like Augustine, Aelred believed that only Christians can have true ('spiritual') friendship, because true friendship requires agreement on both human and divine affairs and a mutual wish for both temporal and eternal happiness. However, Aelred agreed with Cicero that friendship is its own 'fruition and reward' (*De spiritali amicitia* 1:45). For spiritual friendship combines the joys of intimate, trusting, mutual openness with justice, prudence, fortitude, and temperance, which are forms of charity. And, since God is charity, 'he that abides in friendship, abides in God, and God in him' (1:70).

Likewise, the Aristotelian Aquinas (*c*.1224-74) saw the true friend as one who is loved 'simply and for itself', not 'from any extrinsic cause' (*Summa theologiae* IaIIae.26.4, IaIIae.28.2). So exalted is friendship in Aquinas' eyes, that it even serves as a model for charity-love of God. Thus, charity involves communication with God the friend, a communication that enables us to achieve our 'ultimate end' of becoming more like God *Summa contra gentiles* III.1.3, c.19). What remains unexplained is how friendship can have value for God, given that his perfect self-sufficiency renders external goods superfluous (see Aquinas §13).

3 Modern philosophy

Medieval Christian thinkers see *agapē* as predicated on the good or God in everyone, even the sinner, and friendship as predicated on the friend's good character. Martin Luther, however, regarded all conditional-on-goodness love as instrumental, and reinterpreted *agapē* as a spontaneous, gratuitous love, unmotivated by goodness. This turn had a profound influence on later philosophers, both secular and Christian, notably, Immanuel Kant (1785, 1797) and Søren Kierkegaard (1847).

In Kant's discussion, the Lutheran influence was curiously intermingled with the influence of ancient accounts. Like Aristotle, Kant distinguished friendships based on a shared moral attitude - perfect friendships - from lesser sorts and, like Cicero, he emphasized equality and mutuality of love and respect in perfect friendship. Contrary to Aristotle, however, Kant denied emotions any intrinsic moral worth: emotions are subject to natural laws, whereas morality requires freedom or autonomy (self-governance) (see Kant, I. §9). Hence, intrinsic moral worth accrues only to respect and 'practical' love (*agapē*'s secular analogue), which can be willed, and their object, the friend's 'humanity' - the purely rational capacity for moral self-legislation that makes rational beings ends in themselves. Emotional love, and its object, the friend's good character, have, at best, instrumental moral worth. Furthermore, Kant regarded the desire for our friends' happiness as a mere means to our own. Hence, emotional love is

inevitably instrumental self-love. Finally, the view that emotions are involuntary implies that it is *morally* inconsequential whether we love virtuous or vicious people. These counter-intuitive consequences raise the question of whether Kant's view of emotion and emotional love - later echoed by Kierkegaard - can do justice to friendship.

This question, and the utilitarian worry about how to justify the differential concern of friendship if morality requires impartial concern for all, dominate twentieth-century discussions of friendship.

4 Twentieth-century philosophy

The Kantian view of emotion, and its contribution to philosophers' neglect of friendship, is discussed thoroughly by Lawrence Blum in *Friendship, Altruism, and Morality* (1980), the first philosophical book on friendship since Aelred's. In this work, Blum argues that love and concern require thought and choice, are crucial to moral perception and motivation, and can be non-instrumentally (though conditionally and preferentially) directed at friends' good (see Virtue ethics §4). Hence, friendship-love is morally significant.

The idea of the moral significance of friendship is also central to discussions of friendship inspired by Aristotle. Thus, several philosophers have emphasized the importance of friendship to self-knowledge and moral growth. Since friends share the same basic values, each gains greater self-awareness by observing the other's actions and responses, and since friends differ in important ways, each grows through emulation of the other's admirable qualities.

Elizabeth Telfer (1970/1) addresses the utilitarian worry about justifying differential concern (see Utilitarianism §3; Impartiality §2). Telfer's solution is that unequal concern is justified because we are more effective producers of utility (the good) when we concentrate our energies on the needs of the few we know best. However, if utilitarians must justify their friendships as instrumental means to utility, their moral commitments seem psychologically incompatible with friendship's commitments. The usual response to this is that utility-maximization is only a *standard* of right action, not its primary *motivation*. Indeed, utilitarians *should* cultivate the motivations of friendship, subject to the (background) proviso that if, overall, these motivations failed to maximize utility, they would seek to change them. But this is just to say that utilitarians' motivations are, ultimately, shaped by instrumental considerations. So, even if they are *psychologically* compatible with dispositions of friendship, they seem *logically* inconsistent with them.

The theme of preferential concern is salient in feminist and communitarian writings. Feminists emphasize the 'care perspective' as a moral perspective independent of justice, and friendship as a caring relationship that is particularly valuable because of its voluntariness, mutuality and equality. But like most contemporary philosophers on friendship, including communitarians, who oppose justice to friendship, most feminists also oppose the universalist, impartialist justice perspective to the particularist, partialist care perspective (see Feminist ethics; Community and communitarianism). Some, however, recognizing that there is no inherent tension between these perspectives, and deploring the frequent inequality of caring work in female-male friendships, have argued for the reconciliation of the two perspectives, and for the importance of justice in friendship.

But more needs saying. Our particularity cannot exist, or be understood, independently of our common humanity. Hence, caring for someone implies seeing their particularity as a distinctive expression of common aspirations and needs. Conversely, justice implies giving due weight to the particular expressions of people's commonalities. Sensitivity to these aspects requires both justice and care. Justice and care are thus mutually dependent, and equally important in friendship. Indeed, in so far as justice depends on perceptiveness and imaginative effort, and the rightful expectation of these is greater within friendship, friendship *intensifies* the claims of justice.

The article marks the revival of friendship as an important philosophical topic in this century.)

Fries, Jacob Friedrich (1773-1843)

Fries was a German post-Kantian philosopher, active chiefly in Jena and Heidelberg. He was a personal as well as a philosophical enemy of Hegel. Fries' version of Kantian philosophy opposed the speculative idealism of Fichte, Schelling and Hegel, developing an 'anthropological critique of reason'. Fries also emphasized subjectivity in ethics and religion. In politics he was a republican and a German nationalist. For his participation in the Wartburg Festival of 1817 (a gathering of radical student fraternities), Fries was removed from his professorship at Jena in 1820, but restored in 1824. He wrote both scholarly and popular treatises on metaphysics, logic, ethics and politics, as well as mathematics and natural science. His continuing influence early in this century was mediated chiefly by the Göttingen Neo-Kantian Leonard Nelson and by Rudolf Otto's theory of religious experience.

Fries accepted Kant's distinction between sensibility and understanding, the transcendental ideality of empirical objects and the consequent unknowability of things-in-themselves (see Kant, I. §5). Early in his career he defended a critical Kantian position against the emerging speculative idealism in the polemical essay *Reinhold, Fichte und Schelling* (1803). In his *Neue Kritik der Vernunft (New Critique of Reason)* (1807, revised in 1838 under the title *Anthropologische Kritik der Vernunft (Anthropological Critique of Reason)*). Fries was critical of Kant's strategy of arguing for a priori principles by transcendental deduction from the possibility of experience; Fries claimed that a priori principles must instead be known 'anthropologically'. Accordingly, he admitted that we cannot prove the objective validity of Kantian principles such as substance and causality, but only that such principles are indispensable for our own cognitive activities.Fries' approach is sometimes described as psychologism; it does not deny the Kantian a priori, however, but claims that it is knowable through the observation of our faculties.

In ethics, Fries placed primary emphasis on an agent's possession of a 'pure will', one which follows the dictates of conscience and acts solely from the motive of duty (see Kantian ethics). In his *Handbuch der praktischen Philosophie (Manual of Practical Philosophy)* (1818), Fries maintained that we know our duty through the exercise of moral sentiments leading to conscientious 'convictions'; but conscience is always 'educable', and moral judgment fallible. Erring moral judgment, however, does not imply that conscience itself is fallible. An agent whose convictions are objectively wrong still has a pure will, and is therefore to be esteemed rather than blamed. Hence, when judging the acts of others, the standard should always be their convictions, rather than objectively right convictions.

Like Kant, Fries based religion on a faith in divine providence which is rationally justifiable on moral grounds (see Kant, I. §11). But Fries' religious upbringing in Moravian pietism led him to emphasize far more than Kant both the specifically Christian and the experiential aspects of religion. Fries drew the categories of the beautiful and the sublime from Kantian aesthetic theory and - again like Kant - he interpreted these aesthetic experiences as having a moral-religious significance (see Kant, I. §12). For such experiences Fries coined a special term, with a deliberately archaic spelling: '*Ahndung*'; it might be translated 'presentiment', 'divination' or 'inkling'. Inklings do not count as empirical cognitions of any kind, but they do reveal, through feeling, the limitation of the sensible world by the supersensible, and thus count as a kind of experiential awareness of a higher spiritual reality. Fries' philosophy of religion was first expounded in *Wissen, Glauben und Ahndung (Knowledge, Faith and Inkling)* (1805), but later popularly presented in his dialogue *Julius und Evagoras: ein philosophischer Roman (Julius and Evagoras: A Philosophical Novel)* (1813, revised 1822).

Fries is sometimes described as a 'liberal' in opposition to the 'conservatism' of Hegel. This terminology certainly involves a grosser distortion of Hegel's thought than of Fries', but it is oversimplified and misleading in his case too. Fries was a defender of individual rights and liberty, and an egalitarian in economic as well as political matters; he hated the fact that modern society is unified by a cash nexus rather than by moral ties, and he was outraged by the exploitation of the poor by the rich. Fries' views on both points have a German nationalist as well as a communitarian bent, which the term 'liberal' is not well suited to capture. In *Von deutschem Bund und deutscher Staatsverfassung (German Federation and German Constitution)* (1816), Fries advocated the unification of all German states into a single federated constitutional republic - which entailed the abolition of the various monarchical forms of government prevailing in all of them at the time. His German cultural nationalism, however,

made him as hostile to the French Republic and the ideals of the French Revolution as any ultra-reactionary monarchist. While Fries was a social egalitarian, like Kant he favoured a representative republic with a voting franchise limited by property and occupational restrictions (as well as by those of age and gender). Hence he was hostile to the idea of a democratic government, which he equated with mob rule.

Fries was also an anti-Semite, as appears in his pamphlet: *Über die Gefährung des Wohlstandes und Characters der Deutschen durch die Juden* (On the Danger Posed by the Jews to German Well-Being and Character) (1816). He did not recognize Judaism as a religion at all, but saw Jewry as a politico-economic state within a state, one founded on ancient and barbarous principles and hostile alike to individual freedom, moral universality and human dignity. Blaming Jews for the rule of money in society, he opposed any toleration of Judaism, as well as the extension of political and civil rights to Jews. To qualify for such rights, Fries maintained, Jews must first declare their allegiance to the German state (requiring that they renounce Judaism). Judaism was to be 'extirpated root and branch' from German society.

In later life Fries wrote on mathematics and natural science. In general he took Kantianism in a moralistic and empiricist direction, in opposition to the speculative tendencies of German idealism.

Fujiwara Seika (1561-1619)

In Tokugawa intellectual historiography, Fujiwara Seika has been traditionally deemed the founding father of the Zhu Xi school of neo-Confucianism in Japan. He emphasized seiza *(quiet-sitting) in order to perceive the ethical essence of human nature, and asserted the priority of principle, moving away from dualism towards a more rationalistic monism.*

Prior to the Tokugawa period (1600-1868), Zhu Xi's commentaries on the Four Books - the *Daxue (Great Learning)*, the *Analects*, the *Mengzi* and the *Zhongyong (Doctrine of the Mean)* - had long circulated among Rinzai Zen monks (see Zhu Xi; Daxue; Confucius; Mencius; Zhongyong). They were understood, however, as ingredients in a syncretic, religio-philosophical system combining Buddhism, neo-Confucianism, and Shintō. Only in the Tokugawa period did scholars who were keenly interested in neo-Confucianism break away from Rinzai temples to make neo-Confucianism the independent, anti-Buddhist philosophy that Zhu Xi had intended it to be (see Neo-Confucian philosophy; Confucian Philosophy, Japanese). Seika played a cardinal role in this process because he, though initially a Rinzai monk, quit Buddhism to study and teach neo-Confucianism as a purely secular scholar in Kyoto, the imperial capital.

One of Seika's students, Hayashi Razan (1583-1657), also severed his links with Buddhism to pursue a purer neo-Confucian teaching. Razan studied only briefly under Seika, who later recommended him to Tokugawa Ieyasu (1543-1616), the *samurai*-unifier of Japan as of 1600. The Hayashi family, having established itself in Edo (now Tokyo), the shogun's capital, became hereditary scholars serving the Tokugawa regime; they later praised Seika for initiating the neo-Confucian break with Buddhism in Japan, which they continued wholeheartedly. With the Hayashi family, neo-Confucians increasingly came to serve the Tokugawa in ways that Buddhist scholars had served other earlier military regimes (see Buddhist philosophy, Japanese).

Some historians, however, have questioned the extent to which Seika (1) broke with Buddhism, and (2) taught Razan. Some suggest that Razan, a largely self-educated scholar, was legitimizing his family's teachings by tracing them to Seika, a reclusive scholar of aristocratic lineage. It is true that Seika's ideas were developed most faithfully not in Edo, but instead within the confines of Kyoto, an aristocratic haven surrounded by the *samurai*-dominated world of the Tokugawa shogunate (see Bushi philosophy §3). Seika's longest standing, most respected disciple was not Razan but Matsunaga Sekigo (1592-1657), who remained in Kyoto and founded an academy which flourished after Seika's death, largely dedicated to propagating Seika's teachings.

Seika's thought was, unlike Razan's, rather Buddhistic. Seika emphasized *seiza* or 'quiet-sitting', a neo-Confucian meditative practice outwardly similar to *zazen*, or 'sitting-in-Zen meditation', but aimed at perceiving the ethical essence of human nature. Razan had no use for *seiza*. Metaphysically, Seika asserted the priority of principle, skewing Zhu Xi's dualism of principle and material force towards a more rationalistic monism (see Qi). Razan's thinking tended towards materialism and activism. Like Rinzai syncretism, Seika's teachings were eclectic, accommodating critics of Zhu Xi like Wang Yangming, and elements of Buddhism and Shintōas well; Razan disliked Seika's easy eclecticism. Seika and his disciples mostly refused to serve *samurai*, but Razan's family became scholar-servants *par excellence* of the *samurai* estate.

Fuller, Lon Louvois (1902-78)

Lon Louvois Fuller was a leading US legal philosopher and contracts lawyer who in his controversies with H.L.A. Hart and with US 'legal realists' advanced a version of 'procedural natural law' deriving an 'inner morality of law' from the formal properties of law. At the same time, through his insistence that legal interpretation must always consider the essentially purposive character of legal activity, he forms an intellectual bridge between earlier pragmatist accounts of law and the late twentieth-century interpretivist approach associated particularly with Ronald Dworkin.

Soon after Fuller's birth in Hereford, Texas, his family moved to California, where Fuller received his education, partly at Berkeley, but finally, both in economics and law, at Stanford University. In 1926 he took up a post in the Law School of the University of Oregon, subsequently moving to Illinois, to Duke University, and finally to Harvard in 1940, retiring in 1972.

Anti-formalism is the leading theme in Fuller's theoretical work. It is expressed primarily in giving attention to the extra-statal forms of law, to what he calls 'implicit law', and to extrajudicial and extra-legislative forms of production of law, for instance contracts (his speciality) and industrial relations. Law was for him not just the outcome of decisions by authorities, but also and especially of agreements, compromises and mediations, if not indeed of spontaneous and in a certain sense unconscious harmonization of interests and wills. Fuller's anti-formalism was, moreover, expressed not just in the area of the theory of sources of law. The area dearest to him, to which he devoted special attention in his years of maturity, was that of the relation between law and ethics. Formalists were in his view all those who denied that relation, isolating the law in a sphere made either of forms of various types or of acts of authorities or mere external behaviour, or of meanings of linguistic propositions. It was not just legal positivist doctrine that in his view was guilty of this sort of formalism, but also the realism of such jurists as Karl Llewellyn and the pragmatism of philosophers like John Dewey.

He wrote, 'For its meaning any rule of law is tragically dependent upon an understanding of the purpose pursued and this in turn usually requires a feeling for the extra-legal community and its problems.' But legal positivists and 'realists' denied the need for this reference to purposes and to extra-legal problems in order to understand and explain legal norms. These purposes and problems are not included among the conditions for the validity or existence of a norm, whether by legal positivists like Hans Kelsen or Hart, or realists like Llewellyn or Jerome Frank (see Frank, J.; Legal realism §1; Legal positivism). For all these the jurist's ethos is broadly identical with the scientists' ethos, and is value-free. There is no 'role morality' that binds the jurist's activity and conditions the possible contents of their social function. But for Fuller the problem is just that without reference to values one cannot even identify the scope of what is legal.

The values that Fuller refers to in this connection are not those of good morality. They do not entirely and at every point coincide with ethical values. He wrote to his adversary, Llewellyn, 'You say that there are obviously bad rules which exist. I don't deny that.' Saying, then, that a legal norm exists does not mean preaching its morality (goodness). But in order for a legal norm to exist it has to pursue certain purposes, derived from law's external character, that are separate from the specific content of the norms. Thus Fuller's finalism proves to be a formalist approach, but a deliberately *sui generis* formalism, quite different from the imperativist and legal positivist variety. His formalism is essentially Kantian (see Kantian ethics; Legal idealism §2), since the specific purposes of law also define a procedural scope to be respected, without which the legal norm would be an arbitrary act or a mere instrumental measure. Fuller thus seems to anticipate the distinction recently made familiar by John Rawls between 'right' and 'good'. For him, the law is largely equal to just what Rawls today (along with Habermas) would call the sphere of 'right': a series of formal and procedural principles within which each subject can pursue their own purposes and develop their own conception of the good. Fuller identifies in this connection eight fundamental qualities of legal acts, understood as elements in a value-laden legal order: (1) the generality of the act; (2) its publicity; (3) its orientation towards future behaviour; (4) its comprehensibility; (5) the noncontradictoriness of the provision; (6) consistency and constancy in time; (7) not demanding the impossible; and finally (8) an interpretation and application that are sufficiently respectful of the text and of its ordinary meaning. Failing such requirements, a legal act would not be called 'nonexistent' or 'invalid' by Fuller; it would

however be denied the possibility of acting as a justificatory basis for any legally relevant conduct (a judicial decision or a contract between private individuals, for instance). These eight aspects define the 'inner morality of law' or 'procedural natural law' for which Fuller contended in his great debate with H.L.A. Hart and in his greatest book, *The Morality of Law* (1964).

MASSIMO LA TORRE

List of works

Fuller, L.L. (1940) *The Law in Quest of Itself*, 2nd edn, Cambridge, MA: Harvard University Press, 1966.(This is Fuller's earliest work of legal theory, in which he stresses the significance of the purposive approach to law and its interpretation.)

Fuller, L.L. (1964) *The Morality of Law*, 2nd revised edn, New Haven, CT: Yale University Press, 1969.(The great work which establishes the thesis of the 'inner morality of law' in opposition to the version of legal positivism proposed by H.L.A. Hart.)

Fuller, L.L. (1967) *Legal Fictions*, Stanford, CA: Stanford University Press.(Three essays giving a lucid account of the development and significance of 'fictions' in law.)

Fuller, L.L. (1968) *Anatomy of the Law*, New York: Praeger.(A short overview of jurisprudence and legal system, cast in Fuller's characteristic line of thought.)

References and further reading

Summers, R.S. (1984) *Lon L. Fuller*, London: Edward Arnold.(A very thorough account of Fuller's work, with full bibliography, by an author who started as an opponent but became (with qualifications) a supporter of Fuller's doctrine.)

Functional explanation

Explanations appealing to the functions of items are common in everyday discourse and in science: we say that the heart pumps blood because that is its function, and that the car fails to start because the ignition is not functioning. Moreover, we distinguish the functions things perform from other things they do: the heart makes a noise, but that is not one of its functions. Philosophical discussions in this area attempt to specify conditions under which it is appropriate to ascribe functions to items and under which it is appropriate to appeal to those functions in explanations. Difficulties arise because functions are normative: there is some sense in which items ought to perform their functions; failure to perform is a kind of error. Philosophical discussions investigate whether and how this normativity can be understood in scientifically respectable terms. This is important, because biological entities are among the most characteristically functional items. This issue gives rise to differing views as to what it is that functional explanations explain. One view is that they explain how a containing system achieves some goal or effect. Another is that functional explanations explain causally why the functional item exists.

1 Historical context

Science and explanatory practice prior to the modern age was based on the Aristotelian view that explanation is by appeal to causes, and that the primary sense of ‘cause’ is final cause - *telos* or purpose (see Aristotle §9). Activities of things which are parts of wholes were understood as subserving the final causes of the wholes of which they are parts. Their activities, insofar as understood, are their functions. With the discovery of precise mathematically formulable laws of dynamics for general application to all types of inanimate motion, appeal to purposes falls not just out of service but into disrepute. Contemporary science generally conceives nature as the realm of law-like regularity, devoid of irreducible purpose and design. Explanation is still appeal to causes, but these are now conceived in terms of regularity and mechanism. The advent of genetics, the means by which Darwinian natural selection can account for the origins of complex animate behaviour, gives further weight to this conception (see Evolution, theory of).

Yet despite its apparent appeal to purposes and its lack of overt appeal to natural laws, functional discourse and explanation has persisted and been of great utility, especially in the biological sciences. Contemporary discussions seek to provide for these practices a basis which is naturalistic in the modern sense. Three interrelated problems beset such attempts. First, not all effects are functional (the heart has the mere effect, but not the function, of making sound); so functional must be distinguished from ‘mere’ effects. Second, items may have functions which they do not perform. A heart in fibrillation, and the eyes of a congenitally blind person, still have their functions. Third is the specification of what functional explanations explain.

2 Explaining the accomplishment of real goals

Some philosophers distinguish functional from mere effects by taking functions to be contributions to real goals of containing systems, whose accomplishment is partially explained by the resulting function ascription. Ernest Nagel and Morton Beckner, among others, have offered naturalistic criteria for such goals. Roughly, systems are goal-directed if and only if they maintain some feature (possibly a developmental tendency) in relative homeostasis through varying conditions, where that relative homeostasis is achieved by the combined operation of multiple components of the system, whose states are logically independent of one another but causally related. The goal of the system may then be understood as the maintenance of the homeostatic feature (or the state towards which the development tends).

Nagel himself recognized that such non-directed objects as elastic solids and chemical systems in thermodynamic equilibrium are not obviously ruled out by his proposed definition. Moreover, nothing in this approach helps to solve the second, ‘malfunction’, problem, for, unless more is said, a system which ceases to behave in a goal-directed manner ceases to have a goal, and its subparts cease to have a function. Efforts to solve this difficulty generally specify system types in terms of typical members. Since tokens of a type can fail to be typical, token systems can have typical goals they do not accomplish, and their components typical functions they do not perform. However, attempts to distinguish typical members have generally seemed either arbitrary or else to appeal, implicitly or explicitly, to their proper functioning, rendering the account circular for present purposes.

3 Explaining the presence of the functional item

Following claims of sociologists such as Malinowski and Merton that functional explanation is a distinctive method in sociology (see Functionalism in social science), positivist philosophers, notably Hempel and Nagel, attempted to assimilate functional explanation to the deductive-nomological model thought to characterize all explanation. On the deductive-nomological (D-N) model, explanation is a species of inference: from the relevant laws of nature and further facts and relevant background conditions, explananda can be deduced or, in the case of statistical laws, induced (see Explanation §2). Function ascriptions are here taken as equivalent to arguments in which the presence of the functionally characterized item is inferred from a containing system's having certain effects, and from the need for an item of that sort to produce those effects.

It is rarely if ever the case, however, that the only means by which a system can have a given effect is by means of a single specific item. For example, the pumping of blood may be achieved by means of an artificial device. For this reason, plausible function ascriptions will fail as D-N explanations, because the inference from the effect to the presence of the item in question will typically be unsound. This problem has been generally regarded as fatal to any attempt to accommodate function ascription to the D-N model.

The demand that explanations support valid or strong statistical inferences has been generally attacked as too strict. Understanding explanation more modestly, some philosophers continue to maintain that legitimate function ascription explains the presence of functionally characterized items. In a highly influential analysis, Larry Wright (1973) claims that 'the function of I is F' means

(a) I is there because it Fs;
(b) F is a result (or consequence) of I's being there.

The first, etiological requirement is designed to eliminate mere effects, but is clearly too weak to do the job. To cite a well-known example, suppose a pebble has the effect of propping up a rock in a stream. But for the presence of the rock, the pebble would be washed away. Hence the pebble is where it is because it has the effect of propping up the rock. On Wright's analysis, then, the pebble has the function of propping up the rock, which is surely a misapplication of the concept of function. The account also seems under-inclusive, as the second clause demands that the item actually have the functional effect, eliminating mal- and non-functioning items.

The most plausible efforts to refine Wright's basic etiological framework attempt to solve these two problems at once, holding that the etiologies which mark out functional effects are selectional, understood roughly on the model of selectional explanation in evolutionary biology. Importantly, selection always involves the relative replicative or reproductive success of objects with a given feature as compared with competing objects without that feature. The function of the feature is the effect it had in virtue of which objects possessing it were selected. The 'malfunction problem' is supposedly solved by the fact that the function of an item is not identified with any of its actual or even possible effects, but rather with selected-for effects of some predecessor items.

Whether selection history, even in the biological case, actually provides a genuine etiology for particular items is disputed. Robert Cummins (1975) and Elliott Sober (1984), for example, each deny that it does, holding that the etiology of a biological trait is exclusively a matter of the genetic plan inherited by the containing organism. Proponents of the selection view counter that selection accounts for the increased incidence of the item in the population, thereby explaining the fact that the token system in issue possesses it.

Appeal to original selection etiology seems in any event to give rise to further counterexamples, since the effects for which an item has been selected may intuitively be non-functional or positively disfunctional in subsequent generations of the containing systems, and items may have effects in systems that are plausibly regarded as functional, even where their etiologies are either non-selectional, or involve selection for some other effects. Ruth Millikan (1984), whose influential selectional theory of 'proper functions' is intended for use in a naturalized semantics (see Semantics, teleological), has attempted to deflect such counter-examples by claiming that her account is a theoretical definition, rather than an analysis of our ordinary concept of 'function'; failure of overlap with our intuitive function ascriptions is beside the point. However, actual selection histories are generally difficult if not impossible to determine, and the boundaries of the theoretical concept, from an instrumental or operational point of view, are no sharper than those of the intuitive. Moreover, Millikan's account is intended to capture not just biological functions, but others as well, and it is not clear that the notions of ancestry and replication it

requires are applicable outside of the biological context (or perhaps even within it).

Notice that the types of counterexample mentioned above involve the temporal dimension (items can lose functions they once had, and can gain functions after having been selected for other effects). Peter Godfrey-Smith (1994) and Paul Griffiths (1992, 1993), each concerned particularly with biological function, have suggested that these counterexamples can be avoided if only recent or proximal selection history is regarded as relevant to function ascription. The viability of such accounts depends upon whether the notions of ‘recent’ or ‘proximal’ history can be made precise. This is turn depends upon empirical assumptions about likely mutation rates and the incidence and nature of competitors, as well as the assumption that evolution is efficient in the sense that, if an item is not providing some fitness benefit to an organism, then the incidence of that item in the population will decline. Though not implausible, such assumptions are far from clearly warranted. Any attempt similarly to refine a selectional account of function for general application beyond the context of biology would involve a more dubious generalization of these assumptions. Finally, some biological items with selectional etiologies, notably, so-called ‘segregation distorters’, provide no benefit to containing systems, and are even positively harmful. Unless we wish, counter-intuitively, to regard these effects as functional, some non-arbitrary means of ruling them out of the analysis is needed.

4 Explaining interesting capacities

Because of difficulties of these kinds, some philosophers deny that the distinction between functional and mere effects is ultimately real and that function ascriptions do or can operate as explanations of the presence of the functional item. Robert Cummins has offered a well-known account along these lines, on which ascriptions of functional properties to items are always relative to an analytical account of some capacity of some containing system, that is, to an account which breaks down the net capacity into sub-processes which, taken together, are sufficient to explain the capacity. On this view, any capacity of a containing system which results from contributions of its parts is subject to functional analysis, and such parts could conceivably be ascribed innumerable distinct, even incompatible functions (though because of the relativization of function ascription to analysis, no inconsistency results). Cummins’ analysis is thoroughly instrumental, holding that our explanatory interests determine which effects we single out in the sciences for this kind of analysis, hence our ascriptions of functions to particular items, and also which tokens we take as typical, hence what we treat as malfunctional.

There is little doubt that Cummins’ functions are naturalistically respectable, so long as the particular analyses offered are themselves naturalistic, and that they capture much of the actual practice of functional explanation. However, function ascription along Cummins’ lines seems inadequate to account for those cases in which selectional or other etiological accounts adverting to function can be given, notably in the case of artifacts. Moreover, Cummins’ functions are plainly inadequate for service in broader philosophical projects, such as naturalized semantics and epistemology, which require a robustly realist conception of the normativity of function.

Functionalism in social science

In the social sciences, functionalists are theorists who give an especially prominent role to functional explanations. One of the most influential self-defined functionalists, Malinowski (1926), summed up this view: the functionalist 'insists… upon the principle that in every type of civilisation, every custom, material object, idea and belief fulfils some vital function, has some task to accomplish, represents an indispensable part within a working whole'. As an example of a functionalist explanation, one might consider the hypothesis, as argued for instance by Evans-Pritchard in his work on the Azande in Africa, that belief in witches generally plays a role in maintaining social stability (1937).

In the last few decades of the twentieth century, postmodern, or post-structuralist, sociologists have largely disavowed the pursuit of functional explanations. The extremism of some functionalist theses has been matched by an equal extremism in postmodern antitheses. In denying that everything must be explained functionally, some go so far as to say that nothing should ever be explained functionally.

Yet there is liveable logical space between the modernist's 'There has always got to be a reason, the real reason, for everything', and the postmodernist's 'There is never any real reason for anything'. We do not have to be card-carrying functionalists to suspect that functional explanations might be found for at least some of the bewildering things that some people do in various parts of the world. New models of functional explanation are emerging from recent ferment in the biological sciences, and these new models may suggest new ways of approaching functional explanations in the social sciences.

1 Apparent limits of rational choice explanations

When European explorers made first contact with various different cultures, they were sometimes at a loss to understand many of the practices they witnessed. Potlatch for instance: this was a spectacular practice among the indigenous peoples of north-western North America of the giving and then almost immediate destruction of extremely impressive gifts.

After the initial shock of the exotic, some anthropologists then began to imagine how many of their own practices might appear to strangers. Then familiar things in their own lives began to cry out for explanation. In a similar way, Americans may have been prompted to wonder (in, say, the 1980s): why do businessmen wear ties, and business women shoulder pads, for instance?

There is often a common thread running through those things that seemed especially difficult to understand: it is initially difficult to see goals which you could believe the agents to have, and which you could believe that the agents were thinking they could achieve by the actions they were performing. You ask the agents themselves why they do these things, and either they say they do not know, or they do their best to tell you their motives but somehow you still feel that there is more to be explained.

Research in the social sciences is often driven by a sense of bewilderment at some of the things people do. When our common sense (individualistic, rational choice theoretic) explanatory strategies fail to get a grip, functional explanations naturally emerge to fill the explanatory vacuum.

Functional explanations are not the only sorts of explanations that present themselves as rivals to rational choice theoretic explanations. Functionalism emerged from a range of competing explanatory strategies, as for instance: causal/historical explanations, diffusionism, evolutionary theories of the sort typified by Frazer's *The Golden Bough* (1890), and the possibility of explaining some social phenomena by reference to instincts. But functional explanations have had a tendency to become peculiarly pervasive, as soon as we move beyond rational choice explanations.

If you wonder why a person holds a particular belief, or engages in a particular practice, then one answer that is worth pondering is this: perhaps they believe or act as they do just because that is what other people believe and do. But then we are slipping into a regress: why do those other people hold this belief and engage in this practice? You might speculate that this regress ends with a person who, once upon a time, introduced this belief and associated practices for reasons that were perfectly comprehensible at the time, easily explicable by common-sense

rational choice theory. Then this belief and associated practices have been replicated through the ages even though people have forgotten the initial rationale behind them, just because it is, in certain contexts, individually rational to conform to the beliefs and practices of others. In brief, one way to explain something through rational choice theory is by tracing it back to its origins.

This sort of explanation is problematic, however, for several reasons. Often, there are too few empirical constraints on speculations about the origins of a practice. And even if one were confident about the origin of a practice, there remains something to be explained in the fact that while other practices die out, this one persists. Malinowski said: ‘There are no survivors’ (1922). This may be an overstatement: there may be some practices which really are explained by there having been a rational choice by some originator, and then transmission by rational imitation from there on. Nevertheless, it is arguable that our default assumption should be in the spirit of Malinowski’s dictum; usually, there is something important left unexplained by the theory of rational origin followed by rational imitation.

When our default explanations of behaviour, by common-sense rational choice theory, fail to satisfy, we are at a loss for understanding, and functional explanations in the social sciences aim to fill this explanatory gap. This is the first step towards functionalism.

The second step towards functionalism is taken when social scientists begin to look more sceptically at cases that used to seem straightforwardly explicable in terms of common-sense rational choice theory. A suspicion begins to grow, that the veneer of rationality is always just rationalization or, to take a phrase from Marxism, false consciousness. An analogy can be drawn with psychoanalysis. Some sorts of bizarre behaviour seem difficult to explain by common-sense rational choice theory, so extraordinary modes of explanation are introduced, that posit unconscious beliefs and desires. Then the psychoanalyst looks back at superficially rational choices of everyday life and begins to suspect that our ‘real’ reasons are never the conscious reasons. Likewise, the extreme functionalist always looks for ‘latent’ functions behind whatever ‘manifest’ functions there may be, if any.

2 Functionalists and their influence

Many theorists, some less outspoken than Malinowski, have been collected under the label of functionalism because of family resemblances, acknowledged indebtednesses, and affiliations to others travelling under that label. Famous names in the family are predominantly anthropologists: Marcel Mauss, Émile Durkheim, Talcott Parsons, E.E. Evans-Pritchard, Arnold Radcliffe-Brown, Franz Boas, Ruth Benedict, Margaret Mead, Edward Sapir.

Some theorists, like Claude Lévi-Strauss, broke away from some (though not all) of the distinctive doctrines of the self-defined functionalists and travelled under the label of structuralism (see Lévi-Strauss, C.; Structuralism in social science). But the relationship between structuralism and functionalism is often far from clear, and it is not clear whether structuralism is a friend or a foe of functionalism. Structuralists aim to understand a social phenomenon by describing a network of interdependent phenomena within which the thing to be explained is located. The whole network is then seen to be a structure that, at a sufficiently high level of abstraction, is instantiated in every human society. The metaphors guiding structuralism are more often drawn from grammar than from biology; the natural bedfellow of this sort of theory is what is known as systems theory. The supposed universality of certain deep structures suggests that they are in some important sense innate. Structuralism may thus be seen as a sophisticated version of social explanation by reference to human instincts. And this is often seen as a rival to explanation by reference to functions.

Nevertheless, the structuralists’ explanatory strategy does still have a close kinship with functional explanations. Systems theory embodies much of what is distinctive of functional explanations, and is applied across a wide range of research in the social sciences: in politics, social psychology, agrarian studies, and in sociology generally. Much of structuralism can be absorbed into what is called structural-functionalism (this label attaches especially to Talcott Parsons (1952)), and much of systems theory can be construed as raw materials for a more complete functional explanation. A description of ‘how a system works’ can be construed as a description of ‘the functions’ which the elements are playing in the whole.

3 Critiques of functionalism

Yet, as with the posits of psychoanalysis, a social scientist's attributions of functions can be clouded by logical and epistemological miasmas. It is sometimes unclear just what it means to say that some practice has a certain function. And while it is often relatively easy to think up a story about what function some practice might have, it is often hard to know what sort of evidence would count for or against that hypothesis: verification or falsification are not so straightforward.

For instance, Cohen used the tools of the logical positivists, especially Hempel's model of scientific explanation (1965), to articulate the logic of functional explanations. He also drew heavily on what was a novel idea at that time: feedback loops. In *Karl Marx's Theory of History: A Defence* (1978), he brought all this to bear on political examples of special interest to Marxists. This brought the nature of functional explanation into sharp focus, and thereby helped to define some of the growing unease about these sorts of explanations. In an influential critique, in *Ulysses and the Sirens* (1979) and elsewhere, Jon Elster (another Marxist) argued that the required postulations of feedback loops are almost never empirically testable. Hence functional explanations are just as empirically unconstrained as fanciful speculations about origins, which they were supposed to supplant. Much can be said in defence of Cohen, but the kinds of worries expressed by Elster have led many people to retreat from the functionalist bandwagon.

4 Social functions compared with biological functions

To get a grip on the nature of functional explanation in general, it may be useful to consider some of the most successful functional explanations outside the social sciences. Think first of functional explanations of features of artefacts, as for instance when we are puzzled by one of the attachments on a Swiss army knife. However these functional explanations seem to draw us back towards the intentions of a designer, and this is not a model which helps us with the kinds of puzzle-cases which mostly cry out for functional explanation in the social sciences.

Functional explanation in the social sciences can be more profitably compared with functional explanation in the biological sciences. Just as an anthropologist is puzzled by a practice like potlatch, so too a biologist is puzzled by something like the peacock's tail. Adaptationism is the name given to the default assumption, for every feature of an animal which catches your interest, that it must be serving a function. The functionalism of Malinowski's dictum, that 'there are no survivors', is like an extreme adaptationism that would look for a current function not only for say the pancreas, but even for the human appendix.

In the biological sciences, it used to be thought that any references to functions and purposes would presuppose the intentions of a creator. There are analogous viewpoints that could be held in the social sciences. It might be thought that the attribution of social functions would presuppose the intentions of some agent: either the intentions of the human or deity who invented the practice, or the unconscious intentions of the people who engage in the practice, or else intentions embodied in some sort of group mind. For various reasons, the prospects for functional explanation in the social sciences would be slim if they carried that much metaphysical baggage with them.

Fortunately, however, it has become apparent that sense can be made of biological functions without presupposing any conscious processes of design or selection or intention. A biologist may undertake to find a purely biological explanation of the presence of the pancreas for instance, or of the peacock's tail. One way to do so is by finding that this thing has had a propensity to bring about certain characteristic effects, which in turn have contributed to the reproductive capacities of the animals which possessed it. One key concept in evolutionary thinking is that of 'inclusive fitness': this is taken to be the propensity of an organism to reproduce other organisms with this same propensity.

Thus, a biologist who wants to explain the presence of something biological can legitimately do so by reference to its functions, and can do so without thereby incurring a theological commitment. And this is a relief: it does seem obvious that one reasonable way of explaining the presence of, say, the pancreas is by identifying some of its functions, and that this is not tantamount to belief in a creator.

According to what is called the etiological theory of biological functions, for something to have a biological function is for it to have an evolutionary history that explains its current existence by reference to those of its past effects which have contributed to its reproductive fitness and subsequent survival and replication.

The application of the etiological theory of functions to the social sciences generates some interesting results. One

example is provided by Marvin Harris in *Cows, Pigs, Wars and Witches* (1974). Here, some of the puzzling activities of people in New Guinea are explained by attributing to these practices the function of population control.

It is not implied by Harris that the people engaging in various social practices in New Guinea are either consciously or unconsciously aiming at population control. It is not implied that any person or deity designed the practices with the intention that this would result in population control, or that there was any intention on behalf of something you might call a group mind. Yet Harris meant more than just that these puzzling practices resulted in population control. He meant that these practices existed in these social groups precisely because they have a propensity to result in population control. What he hypothesizes is that, over the ages, those social groups which engaged in such practices prospered. Furthermore, those groups prospered because these practices resulted in population control, which in turn ensured that the social group did not exceed the carrying capacity of their environment. If Harris were right about this sort of evolutionary past for the relevant social groups, then the etiological theory of functions would license the attribution of functions to those practices.

Functional explanations of this sort, however, will seldom be well supported by evidence. It is seldom that we will have good reason to believe that the practices we seek to explain have the kind of history which would be called for by the etiological theory of functions.

Consider an example. Some witch beliefs and practices are pandemic, and one might reasonably suppose them to have had enough evolutionary history to justify an etiologically grounded attribution of functions. But the case is different with the large scale European witch-hunts that began a little before 1492, and periodically flared up or smouldered on until the last of these horrific witch-hunts, in Salem in 1692. This is just the sort of case in which explanation by common-sense rational choice theory seems to be missing something of underlying importance, and hence in which we might hope to find some more satisfying functional explanations. Yet the European witch-hunts also constitute a case in which it seems doubtful that we could ever establish the kind of evolutionary history that Harris postulates for the New Guinea case.

There is a striking feature of early functionalism that can be seen to arise naturally out of an etiological conception of functions. There used to be a propensity of early functionalists to attribute to every practice the very same function: that of promoting social stability. There was a tendency to see every belief and every practice as cogs in a social machine for suppressing change. Later functionalists have tried to explain change as well as stability. But if we are using an etiological theory of functions, then functional explanations of change do not rest easily on those etiological foundations.

There is an instructive parallel in biology. On the etiologist’s conception, biological functions cannot contribute to an explanation of an increasing frequency of some brand new feature: with no evolutionary history there can be no etiological function. The etiologist’s functions can only explain the presence of a feature which has contributed to fitness over a significant period of time. So for the etiologist, functional explanations can only get a grip when there is stability rather than change.

Likewise in the social sciences, the etiologist’s functions cannot explain change but only the existence of ‘survivors’. This is a disappointment, because among the things that a functionalist was hoping to explain were, not just ‘where do we come from?’, but also ‘what is going on here?’ and ‘where are we going?’

5 New tools from the biological sciences

Some functional explanations appeal to an intelligent creator, others to Darwinian evolution; both of these kinds are of limited use in social theory. It is thus worth asking whether there may be other logical forms which functional explanations might take, and which might better serve the needs of the social sciences. Here are some models which have been emerging in the biological sciences.

Instead of wondering about why a characteristic is present in an animal, a biologist might take an interest in the fitness of the animal in some particular environment. Overall fitness may then be analysed as the product of several distinct components, somewhat as a physicist analyses a resultant force as deriving from several distinct component forces. Whenever some feature of an organism is currently contributing to the propensity for survival and replication, it is natural to speak of this feature as serving a function. This may be so, even if there is not yet

any history during which this propensity has actually contributed to survival and replication. Not yet having enough history, the relevant feature cannot 'have a biological function' according to the etiologist. Nevertheless, if something is currently contributing to overall fitness, then there is already a clear enough non-etiological sense in which it makes sense to speak of it as serving some biological function.

This construal of functions might be instructively applicable to various problem cases in the social sciences. It is more likely that a sociologist could establish that something is currently contributing to success, than that it has an etiology which explains its current existence in terms of past successes. In the case of the European witch-hunts, for instance, the spread of witch-hunts did not happen by magic; there must have been something about witch-hunts that explained their alarming propensity for replication. This sort of explanation would speak more directly to our bewilderment, than would the backward-looking etiologist's search for an evolutionary history behind the witch-hunts. What is especially puzzling about witch-hunts, after all, what is crying out for explanation, is the way they spread and kept recurring, their replicatory fitness so to speak. And what a non-etiological functional explanation can hope to offer is an identification of the component functions which contributed to that overall replicatory fitness.

In recent biology, there has been heated debate about the so-called units of selection. There have been interesting challenges to the narrowly Darwinian assumption that biologically functional features of an organism must always enhance the inclusive fitness of the individual organism which carries that feature. In opposition, it has been argued that in special circumstances it can sometimes happen that a gene will increase in frequency even if it lowers the survival and reproductive prospects for the organism which carries it. This is, for instance, the point of the Dawkins' 'selfish gene' theory (1976). Others have argued that patterns can evolve in groups of individuals, or even in 'developmental systems' or 'ecologies' that blur the boundaries between organisms and environment, and that these patterns can evolve in a way which is to some degree autonomous from any contributions that are being made to the fitness of the individuals involved. Whether or not the empirical evidence in biology backs up these less narrowly Darwinian biological theories, the logic of these debates over units of selection can teach lessons of value for functional explanation in the social sciences.

If we model social science functional explanations exclusively on narrowly Darwinian evolutionary theory, then the only things with social functions will be things that 'benefit' the particular societies in which they appear. Yet consider again the example of the European witch-hunts. On the face of things, they had a high propensity to replicate themselves even though it was far from obvious what 'benefits' if any they conferred on the social groups in which they occurred. Thus, it is desirable to at least try out the hypothesis that witch-hunts were analogous to an epidemic, which has a propensity to spread and persist even though it does nothing but harm to its victims. It is therefore of theoretical interest if we can find ways of articulating functional explanations of things like the witch-hunts without presupposing that whatever is functionally explainable has to be socially beneficial.

Functionalism in the social sciences has had a troubled history. It arose out of an urgent need for explanations of various bewildering things people do; and at least in some cases it is very tempting to explain these things by reference to social functions rather than to rational choices, instincts, or other explanatory candidates. Arguably, functionalists overplayed their hand in demanding functional explanations for everything. They also had difficulty getting a secure grip on the logic and epistemology of functional explanations. And they had trouble understanding how functional explanations could account for change as well as stability. However, similar difficulties also beset functional explanations in the biological sciences, and progress has been made in overcoming these difficulties. It is premature to conclude, as some postmodernists have done, that functional explanations can have no place in the social sciences (see Post-structuralism in the social sciences; Postmodernism).

Future generations, obligations to

There are at least three different views concerning obligations to future generations. One is that morality does not apply here, future generations not being in any reciprocal relationship with us. Another is that, though we are not obliged to do anything for future generations, it would be praiseworthy to do so. A third view is that justice demands that we respect the interests of future generations.

Philosophers and others have discussed obligations in three main areas: the environment, and the damage inflicted upon it in pursuit of profit; savings and the accumulations of capital; and population policy.

Different theoretical approaches have been taken. According to utilitarianism, the interests of people count equally with those of present people, and all interests are to be satisfied maximally. This may have very demanding implications. Contractarianism rests morality on the agreement of all affected parties. But whose views will be considered in the case of future generations? Perhaps the most plausible approach is communitarianism, according to which obligations can rest on a sense of community which stretches into the future.

1 Areas of debate

The idea that one generation should regard itself as having duties to succeeding generations is not new. We find the following story, for instance, in the Talmud. A a young man once saw an old man planting a carob tree. Knowing that the tree would bear fruit only seventy years later, the young man asked him whether he was sure that he would live long enough to eat the fruit, only to be answered, 'When I came into the world I found it planted with carob trees. Just as my ancestors planted for me, so shall I plant for posterity.' Discussions of the issue in Christian and secular Western philosophy can also be found in the works of Bacon, Kant and others (Passmore 1974). And yet, only in the 1970s did a few scholars start to discuss the issue in depth (Rawls 1971; Sikora and Barry 1978; Parfit 1984).

Relations between distant generations involve important political and moral issues in three areas. The first is the environment. To what extent do contemporary people have the right to deplete resources, to leave 'time-bombs' such as radioactive waste for future persons, and to change the environment while seeking to improve their own material welfare? The treatment of such problems as the depletion of non-renewable natural resources, the pollution of the soil, the contamination of water, the production of toxic and radioactive waste, the destruction of rare species, conservation, and preservation represents the neglect of our duties not only to other contemporaries and, perhaps, to the environment itself, but also to the people of the future. Failure on our side to fulfil these duties incurs much economic cost and considerable difficulties in terms of health and quality of life for future people (thus the optimistic view that technology and science will solve all environmental problems is rejected) (see Environmental ethics.)

The second area in which inter-generational issues are at stake is savings and the multi-generational accumulation of capital. Should we save for future people, even though this prevents us from improving the welfare of the most disadvantaged among contemporaries? Should our governments be allowed to take very long-term loans, assuming that future people will repay the loan plus interest (without necessarily enjoying the fruits of these loans)? The third area is population policies, which also involves the issue of inter-generational distribution and the ever-growing demands for such goods as energy and food (see Population and ethics).

2 Utilitarianism

The question of the grounds for our obligations to future generations raises many theoretical difficulties. The most obvious is that this kind of relationship is different from the usual intra-generational relationship. For example, relevant information is absent. And so, although environmental policies may be seen in terms of inter-generational distribution of access to goods, such as clean air and beautiful landscape, and although we may assume that a certain act or policy will affect future generations, we do not know precisely how bad the consequences of our actions will be, what future generations will want or need, what will bring them happiness, and how many people will be affected (indeed, the very existence and identity of future generations depends on our actions today, and, at least theoretically, we can decide not to reproduce).

These are the difficulties faced by consequentialist theorists such as utilitarians when constructing a theory of inter-generational justice (see Consequentialism; Utilitarianism). It seems impossible to measure or to calculate accurately the personal utilities of the not-yet-born. Moreover, if the time at which people exist cannot affect the value of their happiness, how far should we consider the interests of posterity when they seem to conflict with those of existing persons? A utilitarian who is committed to temporal universalism (that is, regarding the utilities of all persons as equal, whatever the period in which they live) will find it impossible to achieve an equilibrium between our obligations to posterity and the necessity to improve the welfare of contemporaries. If we assume that an investment is productive and is used wisely by subsequent generations, the bigger the initial investment is, the larger the total utility will be. Thus, we may infer that we should reduce our standard of living to a minimum; but then, the next generation will find itself in the same situation, with the same moral demands. Are we then to assume that each generation should save and conserve as much as it can, consuming as little as possible, or almost nothing? While some radical Greens find this idea appealing, many people would find it unreasonable and perhaps impossible to put into practice (see Green political philosophy §4). In addition, there is a serious question about which generation should break the chain and enjoy the fruits of savings by past generations.

3 Contractarianism

Perhaps a contractarian theory could avoid some of these problems (see Contractarianism). The basic idea of contractarianism is that a policy is approved if all concerned people would have approved it had they been asked. Therefore, the first question which arises is who will be ‘invited’ to decide upon the principles of justice between generations: one’s contemporaries, all possible people, or all actual people? The difficulty is that our decisions and policies will also affect the identity and number of future people. Do we first decide upon the policies (that will determine the identity of future people), or upon the identity of the parties to the contract (who will decide upon the policies)?

There are other difficulties with the contractarian theory. It is widely agreed that a contract will be reached in ‘circumstances of justice’, that is, a rough equality in the powers and capacities of the parties concerned, a situation of moderate scarcity, and a conflict of interests, which is moderated by a sense of potential mutual benefit from social and economic cooperation. But it is not certain that, when applied to the inter-generational context, these circumstances still exist. The second and third conditions are a matter of information which is not now available; and it is certain that the first - equality of powers between generations - does not exist, both because the current generation has the capacity and power to decide not to reproduce, and also because it is we who decide about every matter which concerns our relationship with future generations. Even a sense of mutual advantage is lacking: it seems quite reasonable, from the point of view of self-interest, to suppose that, after benefiting from a contract with previous generations, a generation will change the terms of the contract, and hence of its obligations to future generations.

It has thus been suggested that an inter-generational contract should be based on the idea of impartiality rather than on mutual advantage (Barry 1989) (see Impartiality). Justice is an impartial identification with the interests of everyone, and thus in deciding upon principles of justice we should not be influenced by our knowledge of what makes us different from others (such as the fact that we are contemporaries).This contractarian theory is strongly related, however, to the idea of neutrality about the good, and the theorist must then explain, for example, why one should care about the distant future or the conservation of ecosystems rather than show greater concern for the welfare of disadvantaged contemporaries (is the environment, or nature, being unjustifiably assumed as part of the good?).

4 A communitarian theory

Perhaps our obligations to future generations can be derived from the sense of a community that stretches and extends over generations and into the future (see Community and communitarianism; Solidarity). However, unlike the backward-looking Burkeian notion of a trans-generational community that grounds an obligation to continue the heritage of previous generations, this notion of trans-generational community would be based on the argument that, just as many people regard the past as part of what constitutes their ‘selves’, so they regard the future as part of their ‘selves’ (see Burke, E.). These, then, would be the relationships that form the trans-generational community, which constitute the source of our obligations to future generations.

Often, the concept of community is related to face-to-face interaction. It goes without saying that such interaction does not exist in relations between distant generations. But community is arguably a level of relationships standing beyond contractual or legal relations. As such, the trans-generational community is defined not geographically but rather as a moral entity which does not have to rely on face-to-face interactions. Instead, it is constituted by a framework from which people draw their values and derive their cultural and moral identities. It is within this framework that the discourse about the moral and political ideas constituting social life and identity takes place. This discourse is carried on through critical discussion, mass-media, art, literature, academic research, and so on. But is there an interaction of this kind between distant - and not necessarily overlapping - generations?

The answer seems to be affirmative: the moral discourse extends beyond one’s lifetime. There is no reason why, if I want to do something because I think it is good, I should be indifferent to its value if it turns out that it could only be accomplished after my death (compare Rolston 1981; Barry 1977). When we conceive an idea or create something, we reflect on its relevance not only to the political and moral environment in which we live, but also to the political and moral environment of the future. This is illustrated in many spheres of human activity. For example, what is pure mathematics today may become applied mathematics within a few generations; several technological inventions that are utilized now will still be useful in a generation or more. The same applies to the humanities and arts, and also to political theory and reflections on the values a society holds. Thus, philosophers consider how the future will view their ideas, and politicians do certain things because they wish to be remembered in the future in a certain way. Just as contemporaries study and reflect on the ideas of Plato, Kant or Hume, so will future people discuss ideas which were conceived by our contemporaries. Distant generations do reflect on each other’s cultural and moral ideas, and these reflections are always directed towards the future. In that sense, even our notion of the present is future-oriented. This constructs the multi-generational community which extends into the future, and is the source of our obligations to other members of this community (future generations).

All these theories offer explanations of the moral grounds for our obligations to future generations. We are still left with questions such as how much we should save and what we should conserve. The answers to these questions depend partly on the value we attach to natural resources, rare species, and objects of conservation, and are thus related to Green theory and environmental philosophy.

Fuzzy logic

The term 'fuzzy' refers to concepts without precise borders. Membership in a 'fuzzy' set - the set of things to which a 'fuzzy' concept (fuzzily) applies - is to be thought of as being a matter of degree. Hence, in order to specify a fuzzy set, one must specify for every item in the universe the extent to which the item is a member of the set. The engineer Lotfi Zadeh developed a theory of fuzzy sets and advocated their use in many areas of engineering and science. Zadeh and his zealous followers have attempted to develop fuzzy systems theory, fuzzy algorithms and even fuzzy arithmetic. The phrase 'fuzzy logic' has come to be applied rather imprecisely to any analysis that is not strictly binary. It does not refer to any particular formal logic, in the sense in which the term 'logic' is used by philosophers and mathematicians. ('Fuzzy logic' is sometimes used anachronistically to refer to any many-valued logic.)

1 Philosophy

Fuzzy theory has, paradoxically, tended to partition the intellectual community into true believers and unbelievers. Early fuzzy researchers sometimes ignored or failed to credit properly ideas and similar approaches in other areas, resulting in much duplication of work. Simplistic condemnations of bivalent thinking and everything based on it (virtually all of science) were made, along with broad, often unsupported, claims for the utility of a fuzzy approach. These factors together with the intellectual conservatism of the engineering community led to the unwarranted view in some quarters that fuzzy theory was a fringe development designed only to appeal to those unable to measure up to the rigours of higher mathematical techniques. As a result, fuzzy theory was often ridiculed, frequently ignored, and sometimes excluded from conferences and publications. This situation resulted in some circling of the intellectual wagons and the founding of several conferences and journals devoted solely to fuzzy theory.

Some advocates have attributed the schism to philosophical differences, suggesting that a fuzzy world view has roots in eastern philosophies while western thinking has been dominated by bivalence. The fuzzy world view may be summed up by saying that everything is a matter of degree; that nothing real has any property to the complete exclusion of its negation. Fuzzy advocates criticize bivalent thinking as too simplistic.

Advocates of the fuzzy world view claim that bivalent thinking leads to paradoxes, such as the sorites paradox (see Vagueness §2). (If we pluck one hair from the face of a bearded man, he is still bearded; applying this argument many times over, there is no real difference between a bearded man and one without a beard.) They claim that we can avoid such paradoxes by recognizing that most predicates apply only to some degree. (If we pluck one hair from a man's face, then he is simply slightly less bearded than before: any sharp line drawn between having a beard and not having a beard is completely artificial.)

Critics respond that progress in science is usually the result of abstracting or idealizing: maps are useful because they leave out a lot of detail; computation of pressure/temperature/volume relationships does not require, and would be hindered by, the details of molecular positions, masses and velocities. Further, (western) science has developed mathematical techniques for dealing with matters of degree that do not require a fundamental change of logic. With regard to the paradoxes, critics point out that the specification of precise numerical degrees for concepts such as 'bearded' is artificial and impossible to carry out in any meaningful way. Further, there is no reason to think that we can linearly order the universe in terms of degree of 'beardedness'; some individuals are just not comparable. And if fuzzy advocates avoid drawing artificial distinctions, the paradoxes will simply reappear. For example, let 'really-bearded' apply 100% to those individuals whose degree of beardedness is 0.5 or greater and 0% to those whose degree of beardedness is less than 0.5. Unless fuzzy theorists are going to draw some very artificial fine distinctions, then it seems that removing one facial hair should not change one from being 'really-bearded'. If fuzzy advocates draw fine distinctions to avoid the paradox, then they can hardly criticize bivalent logic for drawing such distinctions.

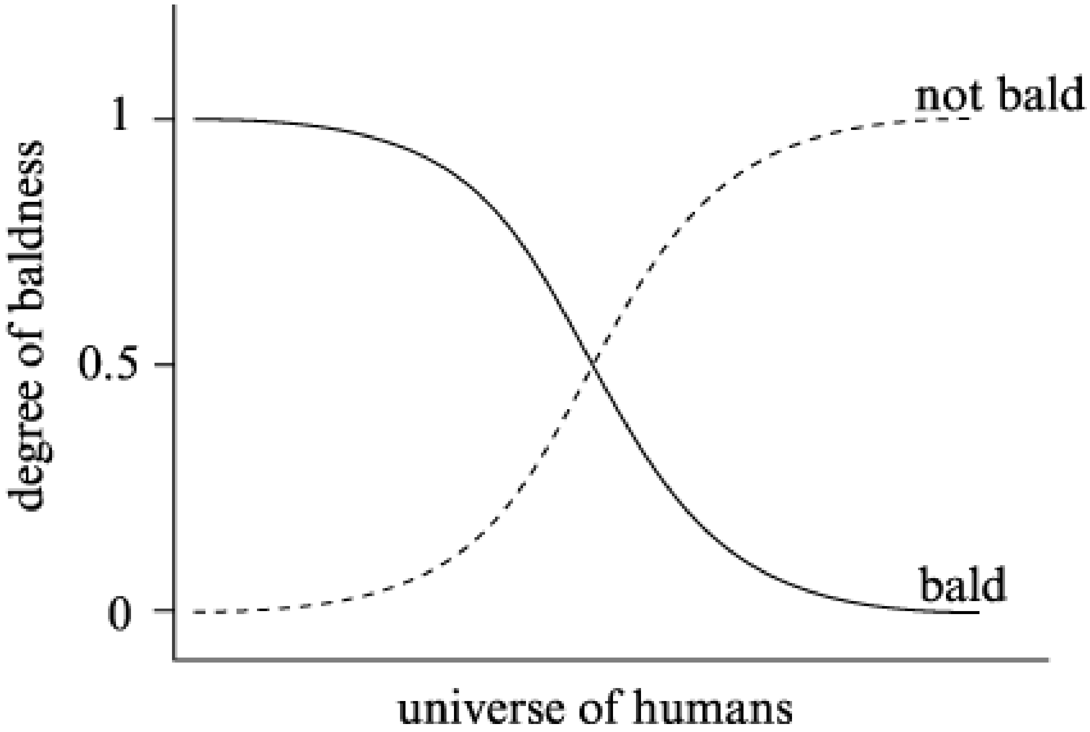
2 Vague concepts

Most of the concepts which we employ are vague rather than sharp. Vague concepts (see Vagueness) are extremely useful for getting around in the world and for communication. Suppose you have been told to look for a

tall, bald man with a beard, wearing a flowered shirt and walking with a limp. You do not need to have the criteria for the term 'tall' specified to within a millimetre; you do not need criteria for baldness spelled out in terms of percentage of coverage of scalp; and so on. If we tried to make these terms very precise, we would have more difficulty applying them. It seems that the more precise a term, the more difficult it is to determine whether it applies.

Classical logic makes the simplifying assumption of bivalence: every sentence is either true or false. But consider the concept of baldness. Certainly there are clear cases in which we would agree that '*X* is bald' is true, and others in which we would agree that '*X* is bald' is false. But there are also a lot of cases on the borderline. Instead of just 'true' or 'false', it is tempting to use locutions such as 'partially true', 'more true than not', and so on. Classical logic does not seem suited to reasoning with vague concepts. Such observations are cited as a motivation for many-valued logic (see Many-valued logics).

Max Black (1937) was the first to publish systematic suggestions for formalizing reasoning with vague concepts. Suppose our universe is human beings, and consider the predicate 'bald'. We may think of the predicate as standing for the set of objects which have the property. In classical logic we would have to decide all borderline cases arbitrarily. Classically, we may identify the set with its two-valued 'characteristic' function: $b(x) = 1$ if *x* is bald, and $b(x) = 0$ if *x* is not bald. Black suggested that instead of taking the characteristic function to be two-valued, we should allow it to take any value in the closed real interval $[0, 1]$. Ordering the universe in terms of degree of baldness, we could plot a 'baldness' curve as shown.



Black advocated treating the negation of a concept as the complement with respect to 1, that is, $\sim b(x) = 1 - b(x)$. He noted that the curve for a vague concept and its negation would cross at the 0.5 position. He further noted that for items in the grey area between 0 and 1, it made sense to say that the item both did and did not have the property. Black recognized the rather arbitrary nature of assigning precise numerical degrees to the membership relation. He suggested using statistical surveys and assigning $b(x)$ to be the percentage of the linguistic community that would agree that *x* has property *b*. Paradoxically, this procedure is based on the possibility of forcing vague concepts into a binary ideal that Black's analysis was intended to avoid.

3 Fuzzy theory

In name, fuzzy set theory was first developed by Lotfi Zadeh (1965, 1975), though the content is strikingly similar to Black's earlier analysis. However, Zadeh took the theory much further.

Assume some universe, *U*; identify each fuzzy set *f* with its characteristic function $f : U \rightarrow [0, 1]$. Zadeh suggested the following definitions.

union:	$(f \cup g)(x) = \max\{f(x), g(x)\}$
intersection:	$(f \cap g)(x) = \min\{f(x), g(x)\}$
complement:	$f'(x) = 1 - f(x)$
universal set:	$u(x) = 1$
empty set:	$\emptyset(x) = 0$

These definitions reduce to the classical notions if we restrict characteristic functions to being two-valued. Union and intersection so defined are commutative, associative, idempotent and mutually distributive, and De Morgan's laws are satisfied. (Zadeh's definitions are not the only ones to satisfy these properties.) However, if there is an *x* in *U* for which $0 < f(x) < 1$, then $f \cup f' \neq u$ and $f \cap f' \neq \emptyset$. These observations correspond well with our intuition that we cannot draw a sharp line between, for example, 'bald' and 'not bald'.

Difficulties arise when trying to treat fuzzy set theory as a basis for a logic of vagueness. There is a simple correspondence between classical set theory on a universal set and classical logic. We may think of the universe as the domain of a model, with sets corresponding to predicates; and union, intersection and complement corresponding to disjunction, conjunction and negation, respectively. The same sort of correspondence exists between Zadeh's fuzzy set theory and the infinite-valued logic of Łukasiewicz (§3). But the quantificational version of infinite-valued Łukasiewicz logic is not finitely axiomatizable. Further, trying to assign a precise numerical degree to the extent to which each person is bald seems even more artificial than simply assigning True or False to each attribution.

Finally, Łukasiewicz logic is not expressively strong enough to allow one to express in the object language the fundamental semantic concepts which served as the motivation. We want our formal language to contain 'autodescriptive' operators J_i for each truth-value *i*, such that, in any particular model, the sentence $J_i(E)$ takes the value 1 if *E* takes the value *i* in that model, and 0 otherwise. But if we include autodescriptive operators in the syntax, it is not possible to give a finitary proof theory for even the propositional logic. So, either the object language must be inadequate to express the notions fundamental to fuzzy theory, or there can be no finitary proof theory.

Zadeh's response to such criticisms was to fuzzify even the metatheory. He suggested that a fuzzy logic should be regarded as a complex association of some formal base logic (for example, that of Łukasiewicz) with fuzzy linguistic structures. Semantic attributions such as 'true', 'very true', 'somewhat true' and so on are to be treated as fuzzy sets. He claimed that all rules of inference are only approximate, criteria for good arguments can be given only semantically, and that the standard metatheoretical notions such as consistency and completeness are not relevant to fuzzy logic.

In spite of the difficulties of developing a formal logic based on fuzzy principles, a fuzzy analysis has led to some elegantly simple techniques for mathematical approximation of complex systems. As a result there have been some impressive systems developed in areas of expert systems and control engineering.

Fëdorov, Nikolai Fëdorovich (1829-1903)

Like many other major figures in the nineteenth-century Russian tradition of speculation, Fëdorov was not an academic philosopher, but an unsystematic religious thinker who sought working answers to the fundamental questions of life. Fëdorov's basic question was: 'Why do the living die?' His answer, in short, was that we die because we neglect our God-given duty to regulate nature. Fëdorov's life work was to formulate an activist approach to the problem of death, a 'common task' in which all people living on earth, all religions and all sciences would eventually be united in a universal project to resurrect all the dead.

Born in southern Russia near Tambov as an illegitimate son in the princely Gagarin family, Nikolai Fëdorovich Fëdorov always wrote from the viewpoint of the outsider looking in, the unlearned addressing the learned, raising for serious discussion the 'naïve' questions that philosophy had previously failed to answer: Why do we kill? Why do we hunger? Why are some people kin and others strangers? Why do we die?

With support from the Gagarin family, Fëdorov received a sound education, first at the Tambov gymnasium, and then at the respected Richelieu Lyceum in Odessa. In 1851, upon the death of the uncle who was his benefactor, Fëdorov left the Lyceum without a degree, ending his formal education. For the next several years, he wandered from village to village through central and southern Russia, serving as a teacher of elementary history and geography in such places as Lipetsk, Bogorodsk, Uglich and Podolsk. As a teacher, Fëdorov seems to have been loved by his pupils but viewed by headmasters as an overzealous nuisance. Narratives from people who knew him in those years depict a devoted, saintly, eccentric educator who engaged his pupils in unusual group research projects and who on one occasion even gave up his own teacher's uniform to pay for the burial of an indigent pupil's father.

In 1869, Fëdorov took a position as assistant librarian at the Rumiantsev Museum in Moscow, where he became a legend among writers and scholars over the next thirty years. Living alone as an ascetic vegetarian, sleeping on a humpback trunk in a tiny rented room, wearing the same overcoat winter and summer, giving away most of his meagre salary to the poor, always the first to arrive at work and the last to leave, he was said to know not only the location and title but also the contents of every book in the vast library. When a scholar would order books on an obscure research topic, it was said that Fëdorov would usually bring double that number, including titles that the scholar had been unaware of but that gave new depth or direction to the research.

His writing was done for the most part in collaboration with disciples, late at night, on work holidays, and in his last years after retirement from the library. His great work, published in two posthumous volumes under the title *Filosofiia obschago dela (The Philosophy of the Common Task)* (1907?-13), is essentially a 1,200-page miscellany of long and short essays, unfinished drafts, fragments and inspired jottings, all variations on a single theme. In the world as it is, ruled by nature, the universe of matter and man is disintegrating into isolated particles; in the world as it ought to be, regulated by human reason, eternal unity and harmony will prevail. Therefore the human task, our common duty, is to join a universal project to guide our own evolution to the point where we may exercise benign control over nature and complete the perfection of ourselves and our universe.

Knowledge, in Fëdorov, is neither subjective nor objective, but 'projective', action guided by reason towards the realization of an ideal. The 'project' is the bridge between the real and ideal, and between all other opposite poles in Western dualism.

By uniting all to overcome the only true enemy of all, namely death, Fëdorov believed that the project of resurrection would also solve the social, economic and other problems of his day. Energies and resources now directed towards war or commercial exploitation would be redirected towards resurrection. Historical enemies would find mutual assistance not only possible but necessary. Unbelievers, who in theory might find Christianity unacceptable, would, by resurrecting the dead, become in practice followers of Christ.

The first steps towards resurrection might consist of little more than the brief, temporary resuscitation of a person who had just died. But, as all scientific technology, sociopolitical organization - indeed, all human knowledge and action - gradually became directed towards the goal of resurrection, more than brief and temporary resuscitation would become possible. Eventually the synthesizing of bodies should be feasible, and ultimately, Fëdorov

believed, whole persons could be recreated from the least trace. To recover particles of disintegrated ancestors, Fëdorov imagined, research teams would have to travel to the moon, the planets, and to distant points throughout the universe. Eventually these outer points of the cosmos would be inhabited by the resurrected ancestors, whose bodies might be synthesized so as to live under conditions that could not now support human life as it is known.

Fëdorov published almost nothing during his lifetime, and his posthumous works were circulated haphazardly in tiny editions. Nevertheless, his ideas had a strong impact on both late nineteenth-, and early twentieth-century Russian intellectuals. In varying ways and to varying degrees, Dostoevskii, Tolstoi and Vladimir Solov'ëv all incorporated Fëdorov's ideas into their work. In the twentieth century, Fëdorov's influence is apparent in the works of the rocket scientist Tsiolkovskii, the writers Briusov, Belyi Maiakovskii, Khlebnikov, Platonov and Pasternak, the religious thinkers Bulgakov, Florenskii and Berdiaev, and the natural scientists Vernadskii, Chizhevskii, Kholodnyi, Kuprevich and Maneev.

Viewed strictly as a philosopher, Fëdorov was an amateur who contributed little to the history of the discipline, but as an imaginative thinker his bold, comprehensive project of resurrection represents a unique coalescence of several previously divergent tendencies in Russian thought, Slavophile and Westernist, scientific and religious, traditionalist and futurist, probably making him, as Berdiaev observed, 'the most Russian' of Russian thinkers.

Fénelon, François de Salignac de la Mothe (1651-1715)

Fénelon is best-known for his utopian political novel Aventures de Télémaque fils d'Ulysse (Telemachus, Son of Ulysses) (1699), which contrasts the rustic simplicity of Greek antiquity with the corrupt luxuriousness of Louis XIV's Versailles. The crucial philosophical works of Fénelon are the Refutation of Malebranche (c.1686-7) and the Maxims of the Saints (1697).

Fénelon came from a provincial aristocratic family (Périgord) which had long served the French crown. First noticed by Bishop Bossuet in the 1670s, Fénelon spent that decade ministering to the 'new Catholics' (ex-Huguenots) in Northern France. He was made tutor to the grandson of Louis XIV in 1689, then Archbishop of Cambrai in 1695.

Although Fénelon is best-known for his utopian political novel *Aventures de Télémaque fils d'Ulysse (Telemachus, Son of Ulysses)* (1699), which contrasts the rustic simplicity of Greek antiquity with the corrupt luxuriousness of Louis XIV's Versailles, the *Réfutation du système du Pére Malebranche* (*c*.1686-7) is the best evidence of his philosophical abilities. Malebranche had argued in his controversial *Traité de la nature et de la grace* (1680) that God governs the realms of nature and of grace equally by 'simple' and 'general' invariable laws; that these laws are the product of divine 'general will' or *volonté générale*; that nature is 'nothing but the general laws which God has established in order to construct or to preserve his work by the simplest means'. God, according to Malebranche, 'does not act at all' by *volontés particulières*, by lawless *ad hoc* volitions, as do 'limited intelligences'; and the generality and simplicity of the divine operation even explains the origin of evil in an imperfect world: if, Malebranche says, 'rain falls on certain lands, and if the sun roasts others… this is not at all because God wanted to produce those effects by *volontés particulières*; it is because he has established [general] laws… whose effects are necessary consequences'. Those who claim that God *ought*, through special *volontés particulières,* to suspend general laws if their operation will harm the innocent, or that he ought to confer grace particularly only on those who will be saved by it, fail to understand that it is unworthy of a wise being to abandon general rules. Those who want God to act through particular wills, simply 'imagine that God at every moment is performing miracles in their favour'. But this 'self-love', Malebranche insists, rests on 'ignorance' of the fact that God 'rarely' departs from generality and simplicity (unless 'order' permits the departure), that he acts 'not often' through anything as *particulier* as a miracle.

In his *Réfutation*, Fénelon challenged the whole Malebranchian notion of a 'general' and 'simple' universe, and thought that he had found a fatal flaw in Malebranche's admission that God acts only *usually*, but not invariably, through general wills and general laws - that God sometimes, though 'rarely', acts through *volontés particulières*. 'In what', Fénelon demands, 'consists that which the author calls "rarely"? These words signify nothing, unless they mean that there is a certain small number of *volontés particulières* which order permits to God outside the general laws, after which he can will nothing particularly'. But if order permits God a small number of particular wills, then 'it follows not only that these *volontés particulières* do not harm in the slightest the simplicity of God's ways, but even that it is more perfect of God to mix some *volontés particulières* in his general plan, than to limit himself absolutely to his *volontés générales*'. Fénelon imagines a hypothetical case in which 'order' has permitted God to have a hundred 'particular wills'; and asks the rhetorical question: 'What, then, is this "simplicity" which is able to accommodate a hundred [particular] wills, which even requires them, but which invincibly rejects the hundred and first?' Fénelon responds in an effective passage: 'If God did not have these hundred *volontés particulières,* he would cease to be God; for he would violate the order which requires them… [but] if he had the hundred and first *volonté*, he would also cease to be God, for he would destroy the simplicity of his ways'. Finally, Fénelon inquires, triumphantly and sarcastically, whether there is 'a fatal number of exceptions which God is obliged to use up, after which he can will nothing except according to general laws?' No one who takes divine omnipotence seriously, Fénelon insists, would 'dare' to say this.

In 1697, Fénelon wrote the book which caused his banishment by Louis XIV, the *Maximes des saints (Maxims of the Saints)* - the 'quietist' work arguing for the 'disinterested' or 'pure' love of God which got Fénelon into such trouble with the Church. In the *Maxims*, Fénelon argued for five degrees of 'purity' or 'disinterestedness' in human love of God. At the lowest end of the scale one finds 'purely servile love': the love of God, not for himself

but for 'the goods which depend on his power and which one hopes to obtain'. One small notch above this Fénelon places loving God, not for 'goods' which he can provide but as the 'instrument' of our salvation; even this 'higher' love, however, is still 'at the level of self-love'. At the third and fourth levels Fénelon finds a mixture of self-love and true love of God; but what really interests him is the fifth and highest degree, the 'pure love' of God that one finds only in 'saints': 'One can love God', Fénelon urges, 'from a love which is pure charity, and without the slightest mixture of self-interested motivation'. In such a love, neither the 'fear of punishment' nor the 'hope of reward' plays any part at all. To achieve this love, one must 'go out of oneself' (*sortir de soi*), even 'hate oneself' (*se haïr*). Malebranche, in his *Traité de l'amour de Dieu* (1697), argued that Fénelon's 'disinterested' love excluded all hope of salvation, as well as all fear of justified punishment, and thus subverted Christianity; and Fénelon's work was finally placed on the Index. Only Leibniz (among important contemporaries) continued to urge that Fénelon's version of 'quietism' was well-meant.

In 1713, near the end of his life, Fénelon wrote *De l'existence de Dieu*, which is not as original and controversial as it is lucid and graceful; its object was to turn back Jansenism as a form of demi-Calvinism. The sheer orthodoxy of this work left it unattacked - an uncommon event in Fénelon's life. But it is the works on Malebranche and on 'quietism' which are still taken seriously - together with *Aventures de Télémaque fils d'Ulysse*, which became the most read book in eighteenth-century France after the Bible.

Gadādhara (1604-1709)

Gadādhara Bhaṭṭācārya was a seventeenth-century Indian philosopher belonging to a school of thinkers, Navya-Nyāya, noted for its extreme realism and its contributions to philosophical methodology. Though Gadādhara's commentaries on the school's key texts are recognized as among the latest, most detailed and innovative, his greater claim to fame is due to his composition of a number of independent tracts on topics in philosophy of language, philosophy of mind, ethics and legal theory. He may be credited in particular with the discovery of a version of the pragmatic theory of pronominal anaphora. His work on case grammar and inferential fallacies is highly admired in India, while recent translations into English have begun to make him better known outside.

1 Life and work

Gadādhara Bhaṭṭācārya lived from 1604 to 1709. He was a native of Bengal, and became a student of the 'celebrated Naiyāyika' Harirāma Tarkavāgīśa at Navadvīpa, the famous centre for philosophical studies in the district of Nadia, northwest of Calcutta. The late medieval philosophical school to which he belonged, Navya-Nyāya, was especially noted for its contributions to logical theory (quantification, propositional laws, soundness of argumentative schema, negation), epistemology (perception, testimony, casual/reliabilist theory of knowledge), and for developing a quasi-formal technical language capable of great exactness.

Gadādhara is known first as a masterly Nyāya commentator, and second for having written a large number of celebrated tracts on particular philosophical concepts. His subcommentary on Raghunātha's *Tattvacintāmaṇidīdhiti (Ray in the Jewel of Knowledge)* soon became a standard and authoritative work, gaining wide popularity throughout India. Gadādhara's principal contributions to Indian logical theory are to be found within this commentary, notably his remarks on the proper analysis of the 'pervasion' (*vyāpti*) relation between an inferential sign and the property to be inferred (Ingalls 1951: 154-61), and his study of the inferential fallacies. Among his philosophical tracts, which are always illuminating and often brilliant, the ones which brought him greatest fame are those on the philosophy of language (the *Śaktivāda* and *Vyutpattivāda (Theory of the Analysis of Sentence Meaning)*), the philosophy of mind (the *Viṣayatāvāda*), and ethical and legal theory (the *Muktivāda*, *Vidhisvarūpavādārtha* and *Vivāhavādārtha*).

2 Philosophy of language

Gadādhara's contribution to the study of language in India is of particular importance. His influence here lies in his move away from the earlier Nyāya epistemic conception of language, of language as essentially an instrument for communication of knowledge, towards a conception more influenced by semantic theory and linguistics. When an expression is indexical its meaning, according to Gadādhara, is not to be identified with its reference, but rather with what is called the *śakyatāvacchedaka* or 'limiter-of-the-property-of-being-a-referent'. Gadādhara supposes that an ordinary nominal, such as '(the) cow', is an indexical referring expression, whose limiter is the property cowhood. Introducing an important semantic distinction related to Kripke's distinction between reference-fixing and meaning-giving (see Kripke, S.A. §2), he asks whether this property is an 'indicating' property (*upalakṣaṇa*) or a 'qualifying' property (*viśeṣaṇa*). According to Gadādhara's definition, cowhood is here a qualifying property just in case one correctly understands an utterance of the word 'cow' only if one thinks of the referent under the mode or sortal 'cowhood'. In the Nyāya technical language, cowhood is then the 'limiter-of-the-property-of-being-the-object-of-the-hearer's-thought' (*viṣayatāvacchedaka*). Gadādhara argues that the limiter of an ordinary noun-phrase must be a qualifying property, for otherwise two coextensive nominals would be synonymous, but that as there is no single conventionally fixed way of thinking about the reference of a proper name, the limiter of a name merely 'indicates' its reference.

Extending this approach to other types of expression, Gadādhara says that the meaning, that is, limiter of reference, of the first person pronoun 'I' is the property 'being the speaker', which here functions merely to 'indicate' the reference. In constructions such as

(1) The teacher said: 'I am not coming today',

Gadādhara distinguishes between 'dependent' and 'independent' occurrences of 'I', a dependent occurrence being defined as one in which the first person is embedded in a sentence or noun-phrase dominated by a verb-phrase. Such occurrences are governed by a coreference rule of the form: 'I' corefers with the principal noun-phrase. Another construction involving pronominal anaphora is examined at great length by Gadādhara:

(2) There is a pot next door - bring it!

Here, however, Gadādhara rejects a coreference rule in favour of a pragmatic account of anaphora: the reference of the pronoun is determined by the speaker's referential intentions.

Pāṇini, the fourth-century BC Indian grammarian, is renowned for his introduction of a *kāraka* or deep-level analysis of sentence structure, which permits one to say that

(3) Rāma cooks rice for Sitā, and
(4) Rice is cooked by Rāma for Sitā

have the same deep structure, the inflected noun 'Rāma' in both sentences designating the logical 'agent', even though it has nominative case inflexion in (3) but instrumental case inflexion in (4). In his *Vyutpattivāda* Gadādhara adapts this method of sentence analysis, interpreting the *kārakas* in a manner akin to the 'participant roles' of modern case grammar, and making them the basis for a compositional account of the relation between word-meaning and sentence-meaning.

3 Legal theory

Like many late Indian logicians, Gadādhara wrote also on philosophy of law, reflecting the political importance of Hindu legal theory in Islamic, and later in British, India. Raghunātha, for example, argued that the older definition of property (*svatva*) as the capacity of a thing to be used at pleasure hid a circularity, for even if an object is owned there are still restrictions on its use, and these restrictions cannot be explicated without appeal to the notion of property itself. Raghunātha (?1500-50) proposed instead that property is a *sui generis* ontological category. Some later Naiyāyikas (apparently including Gadādhara) rejected this 'category' view in favour of a subjectivist definition of property as a legally grounded dispositional judgment 'this is mine', a definition which was itself subjected to further refinement (see Derrett 1956).

Gadamer, Hans-Georg (1900-)

Hans-Georg Gadamer is best known for his philosophical hermeneutics. Gadamer studied with Martin Heidegger during his preparation of Being and Time (1927). Like Heidegger, Gadamer rejects the idea of hermeneutics as merely a method for the human and historical sciences comparable to the method of the natural sciences. Philosophical hermeneutics is instead about a process of human understanding that is inevitably circular because we come to understand the whole through the parts and the parts through the whole. Understanding in this sense is not an 'act' that can be secured methodically and verified objectively. It is an 'event' or 'experience' that we undergo. It occurs paradigmatically in our experience of works of art and literature. But it also takes place in our disciplined and scholarly study of the works of other human beings in the humanities and social sciences. In each case, understanding brings self-understanding.

Philosophical hermeneutics advocates a mediated approach to self-understanding on the model of a conversation with the texts and works of others. The concept of dialogue employed here is one of question and answer and is taken from Plato. Such understanding never becomes absolute knowledge. It is finite because we remain conditioned by our historical situation, and partial because we are interested in the truth that we come to understand. By grounding understanding in language and dialogue as opposed to subjectivity, Gadamer's philosophical hermeneutics avoids the danger of arbitrariness in interpreting the works of others.

Gadamer's most important publication is Wahrheit and Methode (Truth and Method) (1960). He has also published four volumes of short works, Kleine Schriften (1967-77), containing important hermeneutical studies of Plato, Hegel, and Paul Celan among others. His many books and essays are collected into ten volumes (Gesammelte Werke). Gadamer is widely known as a teacher who practises the dialogue which is at the core of his philosophical hermeneutics.

1 Life

Gadamer was born in Marburg and brought up in Breslau, and his academic life mirrors the most important philosophical movements in Germany in the twentieth century. He encountered Neo-Kantianism when he studied philosophy at Marburg from 1918 to 1922, completing his doctoral dissertation in 1922 under the direction of Nicolai Hartmann and Paul Natorp (see Neo-Kantianism §§3-5). In 1923 he transferred to Freiburg to study phenomenology with Edmund Husserl and Martin Heidegger, whom he followed to Marburg in 1924. Gadamer completed his habilitation under Heidegger's sponsorship in 1929, just two years after Heidegger had published his existential phenomenology in *Being and Time* (1927). Gadamer was a precocious student, obtaining his doctorate and his habilitation at the unusually early ages of 22 and 29 respectively. While at the University of Marburg, Gadamer also studied classical philology and completed his state examination in philology in 1927. Gadamer's doctoral dissertation and habilitation were both on Plato. He published the latter, *Platos dialektische ethik*, in 1931.

Gadamer began teaching while still at Marburg. He also taught at Leipzig (1938-47), Frankfurt (1947-9), and Heidelberg, where in 1949 he assumed the chair in philosophy previously occupied by Karl Jaspers. After his retirement in 1968, Gadamer continued to lecture at the University of Heidelberg and began teaching part of the year in the USA, notably at Boston College.

In 1952 Gadamer and Helmut Kuhn founded the *Philosophische Rundschau*, which quickly became one of Germany's most important philosophy journals. Gadamer published relatively little after 1931, until he produced *Wahrheit und Methode (Truth and Method)* in 1960. Like Kant's *Critique of Pure Reason*, which was also published late in the author's life (Kant was 57), Gadamer's book immediately established its author's reputation. *Truth and Method* and *Being and Time* were recognized as the most important contributions to hermeneutics in the twentieth century. In the 1960s Gadamer became engaged in a lively debate with Jürgen Habermas and the Frankfurt School about hermeneutics and critical theory. In the 1970s, and in connection with his second teaching career in the USA, Gadamer was able to expand on the contribution that *Truth and Method* had made to practical philosophy, a move that brought him into contact with Americans influenced by pragmatism, such as Richard Bernstein and Richard Rorty. Later, in the 1980s, Gadamer initiated a debate with Jacques Derrida on hermeneutics and deconstruction.

2 *Truth and Method* and Kant’s aesthetics

Even in the earliest stages of his philosophical journey, when he was writing on Plato, Gadamer remained convinced that the experience of art was connected to philosophy. But it was not until *Truth and Method*, his late and mature work, that Gadamer makes this connection philosophically explicit. Gadamer maintains that the experience of art is an experience of truth as an ‘event’ that ‘ happens to us over and above our wanting and doing’ ([1960] 1975: xvi). This event structure of truth is, Gadamer believes, a universal characteristic of human understanding. The phenomenon of understanding - *Verstehen* - that concerns Gadamer should not be confused with *Verstand*, which is also translated as ‘understanding’. *Verstand*, most notably in Kant’s *Critique of Pure Reason*, is objectifying and means the natural scientific understanding subjects have of something other than themselves, namely, spatiotemporal objects (see Kant, I. §6). The phenomenon of understanding that Gadamer takes up in *Truth and Method* is that introduced by Heidegger in §32 of *Being and Time* (see Heidegger, M. §3). Understanding as *Verstehen* is non-objectifying. It is ontological and concerns a subject’s very being in the world. Understanding is once again of something other than oneself, but in this case it is of other possibilities for oneself as a being in the world.

Truth and Method begins when Gadamer takes up the question of truth as it emerges from the experience of art. The target of Gadamer’s criticism is Kant’s aesthetics and the abstraction of the art work from its original world and from our own concrete historical situation when we experience a work aesthetically. Gadamer’s goal in the first part of *Truth and Method* is to transform aesthetics by transcending the limits placed upon what counts as aesthetic experience and opening up the truth-claims made on us in this experience by works of art and literature. Gadamer shows how Kant’s *Critique of Judgment* subjectivizes aesthetics by narrowing the concept of aesthetic experience to the experience (*Erlebnis*) of the subject’s pleasurable ‘state of mind’ (the free play of the mental faculties) (see Kant, I. §12). Gadamer contrasts this narrowing to the role played earlier by judgment and taste in connection with culture and the formation of a *sensus communis* (‘common sense’). Gadamer proposes that we think instead of aesthetic experience on the model of *Erfahrung*, Hegel’s concept of experience. *Erfahrung* gives us something to understand. It challenges us so that we must ‘change our minds’. The subjective universality or ‘disinterested interest’ that Kant claims for aesthetic experience and the judgments we make about it cuts us off, Gadamer concludes, from the interest we take in the truth of works of art and literature in so far as they challenge us to change our minds and therefore our lives.

The experience of art offers Gadamer a model for how truth happens in human experience generally. Gadamer models human experience not on the sense perception of what is immediately given but on the experience of reading and understanding a text which has become historically distant from us. He reminds us of the practice of hermeneutics or interpretation in the reading and understanding of legal and religious texts that are temporally distant. These texts remain ‘classical’ (like those literary texts, ‘the classics’, that admit of no final interpretation) so long as they continue to challenge present-day readers to produce new interpretations of them. According to Gadamer, we understand these texts when we understand them to be making a true claim about how we are to understand something that is an issue for us in our own world and historical age. Like the experience we undergo with art, the event of understanding these texts changes our minds. Despite the prominent role played in *Truth and Method* by the experience of art, this book turns out not to be a work in aesthetics. Instead, *Truth and Method* transforms Kantian aesthetics into a philosophical hermeneutics, a general theory of understanding and interpretation that is also an ontology of ourselves as historical beings (see Hermeneutics §5).

3 Basic concepts of philosophical hermeneutics

Four interrelated concepts define Gadamer’s philosophical hermeneutics. The first of these is ‘effective-historical consciousness’ (*wirkungsgeschichtliches Bewusstsein*), which means that consciousness is at once ‘affected by history’ and ‘open to the effects of history’. Gadamer’s philosophical hermeneutics preserves Heidegger’s central insight in *Being and Time* that the understanding of oneself and one’s possibilities as a being in the world is temporal and situated historically. Understanding is therefore constituted in a positive way by its own historicality instead of being threatened by it, as Enlightenment thinkers after Descartes had feared. To be affected by history means that there can be no unmediated starting-point of the kind Descartes sought. To be open to the effects of history means to allow one’s present horizon of understanding to be called into question by texts and works of art handed down to us by tradition.

Gadamer retains Heidegger's concept of the 'hermeneutical circle' to express the way understanding is always mediated. Understanding is always circular, but in a non-vicious sense. Anticipation of meaning, preconceptions or prejudgments ('prejudices') play a constitutive role as we use them to project wholes out of the parts of the text or art work that we are interpreting. Gadamer's claim that prejudgments enable understanding, that is, positively condition it, has been mistaken to mean that he affirms prejudice blindly. But Gadamer does not mean that we must remain uncritical of those prejudices that block or distort our understanding of a text or art work. Rather, since we cannot get out of the hermeneutical circle of understanding and assume an unprejudiced view from nowhere, we must aim instead at becoming more conscious of our particular hermeneutical situatedness so that new and more appropriate judgments can play the role of older and less appropriate prejudgments in conditioning our understanding of the text or art work.

The third concept is that of 'play' (*Spiel*), which Gadamer borrows and transforms from Kant's aesthetics (the free play of the mental faculties). 'Play' or 'game' is used at two crucial points in *Truth and Method* to describe how his philosophical hermeneutics transcends the subjectivism of aesthetics and of modern philosophy in general. Gadamer speaks first of the game we play with art to show how individual subjects most lose themselves to experience the truth claimed by the art work, just as an individual player must in order to become absorbed in the game. And when, in Part 3, Gadamer turns to focus upon language as the medium of hermeneutical experience, he grounds language not in the consciousness of an individual subject but in the language game we call dialogue or conversation.

Language in the form of conversation leads us to the fourth concept, the 'fusion of horizons'. The understanding of a text or art work involves a challenge in so far as the truth claimed by the text or art work is at variance with what the interpreter believes to be the truth about the matter at issue ('*die Sache*'). The interpreter's horizon of understanding first excludes the truth claimed by the text or art work. The interpreter opens up to the horizon of the other (the text or art work) by allowing it to question the interpreter's own prejudgments about the matter at issue. What ensues is a dialogue of question and answer where the interpreter not only questions the truth claimed by the work but also allows what the interpreter prejudges to be true to be put into question by the work. The fusion of horizons that ends the dialogue occurs when the interpreter understands differently. This may require altering the interpreter's prejudgments in line with what has been learned from the text or art work. But it may also mean reaffirming the original prejudgments for different reasons since they have survived the challenge by another way to judge the matter at issue.

4 *Truth and Method* and Heidegger's existential phenomenology

Truth and Method also takes up the existential phenomenology of Heidegger's *Being and Time* and transforms it into a philosophical hermeneutics, and here too the experience of art is pivotal. Gadamer has always acknowledged that Heidegger's *The Origin of the Work of Art* (1936) played a vital role in his first formulation of the idea of a philosophical hermeneutics in the 1930s. In this essay, Heidegger asserts that the truth which an art work discloses emerges out of the strife between 'earth' and 'world'. What strikes Gadamer as so insightful about Heidegger's characterization of the experience of art as the 'event of truth' is that 'earth' becomes a 'necessary determination of Being of the work of art' (1994: 100). 'World', Gadamer notes, is a familiar concept from *Being and Time*. 'Earth', however, introduces an altogether new conceptuality, one drawn from the poetry of Friedrich Hölderlin. 'Earth' (*Erde*) does not mean 'matter' (*Stoff*), but that which continues to conceal itself even though it is that out of which everything emerges and into which everything retires.

Although Gadamer underplays this, Heidegger concentrates almost exclusively on the poetry of Hölderlin in the Nazi period, because he believes it to be history-making, that is, capable of inaugurating a new epoch of European history, one identified from now on as German, just as poetry had inaugurated the Greek beginning of European history. Gadamer nowhere shares Heidegger's belief in the need to inaugurate a new beginning. On the contrary, what is necessary is a creative renewal of the truth-claims made by the tradition and history of Europe's past. Gadamer aims, therefore, both to retain what is insightful about Heidegger's turn to art, poetry and language in his works after *Being and Time,* and to redirect it to the past. Accordingly, Gadamer reinterprets 'earth', which in Heidegger is associated with the German country and land, so that it takes on the meaning of the European tradition in which Gadamer finds himself embedded. This tradition is like 'earth' in that it continues to conceal resources within itself. But for Gadamer these become resources for renewal instead of unmediated sources of the

altogether new.

Not surprisingly, we find that Hölderlin's poetry plays only a minor role in Gadamer's thinking, compared to the importance Gadamer continues to attach to the Plato's dialogues and Aristotle's practical philosophy. Plato's concept of dialogue, for example, lives on in Gadamer's concept of language in and as a conversation with the text. And Aristotle's concept of practical wisdom (*phronesis*) survives and flourishes in Gadamer's solution to the problem of the application of our understanding of a text to our particular situation (see Aristotle §23; Plato §4).

5 Criticism and self-criticism

Gadamer has continued to define his hermeneutical philosophy in response to questions raised about *Truth and Method*. Emilio Betti (1980) and E.D. Hirsch (1967) were the first to object to Gadamer's philosophical hermeneutics in the belief that it failed to provide a method for validating interpretation. Habermas questioned instead Gadamer's rehabilitation of prejudice and the authority of tradition (see Frankfurt School §4). Derrida has raised doubts about Gadamer's reliance on a hermeneutics of good will after Nietzsche's hermeneutics of suspicion (see Nietzsche, F. §7). In each case, Gadamer has used these objections as an occasion to expand upon the scope of his hermeneutical philosophy and clarify its potential.

In 1992, in reflecting on his philosophical journey during the better part of the twentieth century, Gadamer acknowledges the validity of the following criticisms of *Truth and Method*. He admits that his concept of scientific method did not reflect the nuanced and complex concept of method that had grown up in the natural sciences between the 1930s and 1960. He grants that *Truth and Method* did not sufficiently differentiate the historian's work of interpreting a historical text from the philologist's work of interpreting a literary and classical text. Finally, he recognizes a potential problem with his concept of play or game. In conversation, the game of language that mediates understanding, we transcend our subjectivity dialogically by changing our self-understanding along with changing our understanding of the truth claimed by the other. In the experience of art, however, we seem to transcend subjectivity in a more one-sided way. The game we engage in with art challenges us to change our minds and ourselves without apparently being able at the same time to reciprocate and challenge the work's claim to truth.

Gadamer's own self-criticism has led him to renew the question of the relation between philosophy and art or literature. Gadamer argues that there is indeed reciprocity in the game that we engage in with art. Just as the art work challenges us to change our minds, so too our interpretation of the art work challenges it to produce a response to our questions. By interpreting the art work, we do not merely reproduce the truth claimed by the art work but we produce a different understanding of its claim to truth.

Ironically, once play and gaming became associated with post-structuralist theories of interpretation, especially that of Derrida, Gadamer's attempt to rethink his earlier concept of the game we play with the art work risks being misunderstood as an affirmation of the very subjectivity in understanding and interpretation that *Truth and Method* sets out to deny. Gadamer attempted but failed to engage successfully in a dialogue with Derrida on the concept of the interpretation of a text that appears to divide the hermeneutical renewal of tradition from its deconstruction (Michelfelder and Palmer 1989). The confrontation of hermeneutics and deconstruction, both legacies of Heidegger's later philosophy, remains a task for the future.

Gaius (*c*.110-*c*.180)

*Gaius was a great but not a typical classical Roman jurist. His Institutes (*c.AD *161), an introductory textbook, is the first known attempt to see Roman law as a systematic whole. His scheme was used by Justinian and so played a central role in subsequent European thought on the classification of law.*

Little is known of the Roman jurist Gaius apart from his writings. An adherent of the Sabinian school at Rome, he seems to have lived in the provinces. Gaius was not typical of the jurists of the classical age (*c*. 50 BC-*c*.AD 250), who do not cite his opinions. Unlike them, he held no political office. Evidently a teacher of law rather than a practising lawyer, his writings show an interest in legal history, Greek philosophy and the classification of law. None of these was characteristic of the other jurists, who clung to a tradition of clever argument in individual cases, the casuistic approach.

Extracts from his many works in the *Digest* show that Gaius was also a master of practical legal reasoning in this sense. But his *Institutes*, a short introductory textbook written about AD 161, is unique. The only classical law book to have survived complete and unaltered by Justinian (see Justinian), a manuscript of it was found by the German historian Niebuhr in 1816. After some opening remarks on the sources of law, Gaius presents his famous tripartite division of private law into persons (personal status), things (property, succession and obligations) and actions (forms of action and procedure). There are many subdivisions until, for example, the level of individual contracts is reached. Out of a great heap of statutes, edicts, opinions and actions Gaius produced for his students a clear map of the law.

Was Gaius an original thinker? Some have argued that he borrowed his system from an earlier legal work, but no such book is known to exist. And when, for example, Gaius deals with the classification of obligations, he sounds like someone breaking new ground. His debt to Greek philosophy raises a different question. That he was familiar with some common philosophical ideas is suggested, for instance, by his many reference to what is ‘natural’ in relation to law. But even if he did sometimes adapt and apply classifications he found in Aristotle and elsewhere to the intricacies of actual Roman law, this in itself was an original achievement. Gaius deserves to be considered a great lawyer, an excellent teacher and a brilliant inventor.

Gaius’ merits were eventually recognized in the later Empire, when his *Institutes* became a standard work in the law schools. Justinian calls him ‘our Gaius’ and based his own *Institutes* squarely on the work of Gaius. In this way Gaius became the teacher of Europe. The institutional scheme was not perfect, but it was there. Through it, Gaius can claim to be the father of systematic legal thinking in the West.

Galen (AD 129-*c*.210)

Galen was the most influential doctor of late Greco-Roman antiquity. But he was also a notable philosopher, who desired to effect a synthesis of what was best in the work of his predecessors, not only in medicine but also in logic, epistemology, philosophical psychology and the philosophy of science and explanation. In logic he made use of both Aristotelian and Stoic material, but supplemented them with his own treatment of relational logic. His epistemology, while resolutely anti-sceptical on the grounds that nature could not have furnished us with systematically delusive sense-organs, was none the less sober and cautious: some philosophers' questions are simply unanswerable. He attacked the Stoics' unitary psychology, establishing by means of detailed experiments that the brain was the source of voluntary action. Finally, drawing on the philosophical and medical tradition, he crafted a theory of cause and explanation sophisticated enough to rebut the sceptical challenges to such notions, and rich enough to enable him to construct a comprehensive physiology and pathology on its basis.

1 Life and work

Galen is best known to history as a doctor, the systematizer of a Hippocratism (see Hippocratic medicine) which became the foundation of medicine for more than 1,500 years. But he was also a considerable philosopher in his own right, writing extensively on logic and language, and scattering philosophical remarks, arguments and controversies throughout his vast medical *oeuvre*. And this is no mere accidental collocation of interests, to be explained by the fact that he trained first in philosophy before turning to medicine. He wrote a short pamphlet *That the Best Doctor is Also a Philosopher*, which survives, stressing the intimate connections between the two disciplines, and never tired of pointing out the errors made by his medical colleagues caused by their insufficient attention to logical detail and their ethical shortcomings.

Galen was born into a well-to-do family in Greek Asia Minor, and received an extensive liberal education, learning philosophy from leading Platonists and Peripatetics, as well as Stoic logic. He had little time for atomism in any of its forms (see Atomism, ancient), and is scathing about the inability of the atomists, and doctors influenced by them, to give satisfying explanations of complex phenomena in purely material terms without recourse to teleological explanation. For Galen, teleology was an essential part of any rationally acceptable explanation of the world and its contents.

Galen travelled widely in pursuit of his education, absorbing both Empiricist and Rationalist views (see Hellenistic medical epistemology), which conspired to nurture his distinctively eclectic views in methodology, as well as a syncretism in philosophical outlook typical of the times (although original enough in its elaboration). He moved to Rome in 162, making (on his own account, in *On Prognosis*) an immediate impact upon the cultural and aristocratic elite for his competence as a doctor and for the soundness of his logical reasoning.

He wrote at a furious pace, dictating to relays of scribes, and his output of treatises medical and philosophical, in the form of original monographs or of commentaries on the masters was correspondingly enormous (see §2 below). Some of this *oeuvre* was destroyed by fire in his own lifetime, and much else has been lost since. But a great deal survives in Greek (Kühn's monumental edition runs to about 10,000 pages of text), and much else in other languages, notably Arabic, Latin and Hebrew, a fact ensured by his early acceptance in the Islamic world as the great repository of medical wisdom. His influence on the subsequent history of medicine was enormous, his views in physiology and anatomy not being superseded until the sixteenth century, his medicine itself surviving even longer.

2 Galen's intellectual inheritance

Galen's chief sources of inspiration were Hippocrates and Plato, his *On the Doctrines of Hippocrates and Plato* being a typically syncretistic attempt to demonstrate their basic agreement on all important issues. His theory of disease is fundamentally Hippocratic in conception: an illness consists in the impediment to or destruction of one of the crucial functions of the body, while treatment involves restoring that function to its proper state. These impediments can take the form of imbalances in the fundamental four humours, blood, phlegm, and yellow and black bile, which regulate the body; and each of the four humours is itself associated with one pair of the four basic qualities, hot, cold, wet and dry, which may by distempered either individually, or in their humoral pairs.

Furthermore, there are four types of disease of the organic parts, plus a general category he terms ‘loss of cohesion’ (this scheme forms the basis of *On the Therapeutic Method*). However, for Galen, Hippocrates was important not so much as a medical gospel, but rather for having exemplified a methodology of investigation, theorizing, and testing, which, if competently pursued, would in time reveal the whole of medical truth.

Galen’s greatest philosophical debt to Plato is his adoption and elaboration of the type of creationist natural teleology sketched in the latter’s *Timaeus* (see Plato §16; Teleology). For Galen, this time in agreement with the Stoics (see Stoicism §5), the idea that the world, in all its structural regularity, might be a spontaneous efflorescence of blind mechanical forces was simply anathema: no mechanical theory could possibly account for the complexity and organization of the world and its inhabitants. Moreover, the artifice of such a world demands an actual Creator: Aristotelian purely immanentist teleology is equally unsatisfactory. Galen calls his own great teleological account of biological structure and function, *On the Function of the Parts*, a ’hymn to Nature’ and the Creator. Those (such as Erasistratus; see Hellenistic medical epistemology), who have dared to say that Nature on occasion does something in vain have simply failed to appreciate the subtlety and complexity of her works, which are only apparent to the skilled and conscientious investigator.

Galen also seeks in *On the Doctrines of Hippocrates and Plato* to ground the Platonic hypothesis of a tripartite soul, with reason in the brain, emotion in the heart and desire in the liver, upon detailed anatomical investigation and experiment. He subjects the unitary psychology of the Stoics (see Stoicism §19) to a withering attack, accusing them of logical incompetence as well as blindness to the evidence. Yet Galen was equally powerfully influenced by the Peripatetic tradition in natural science: while the underlying pattern to his teleology is Platonic, the great model for his practical work in the investigation of function is Aristotle’s biology. And he admired Aristotle’s logic, sometimes troubling to cast his arguments in syllogistic form (but see §4 below).

3 Theory of causation

Equally, Galen happily adopts the basic model of Aristotle’s four causes (*Physics* II 3) and deploys it in his own analysis (see Aristotle §9). There is ample room for the final cause in nature given his commitment to teleology; efficient causes clearly have a role in explaining how things come to be what they are; while a just appreciation of the importance of the material cause will help to evade some of the stronger sceptical attacks (notably again those of Erasistratus) upon the coherence of the notion of causation in the first place. The reason why different things respond differently to the same influences (the prime empirical weapon in the sceptical armoury) is that they are differently constituted, and so differently susceptible (a view perfectly consistent with Hippocratism: the different constitutions, at least in the case of animals, will be humoral in structure).

Yet Galen’s use of Aristotle is selective and creative. He has very little use for the formal cause (or indeed for Platonic hypostasized Forms) as such, although he is perfectly well aware of the importance of form for function. He simply does not regard it as a properly separate explanatory category; instead he adopts the Middle Platonist category of the instrumental cause.

Equally, his treatment of efficient causes is unorthodox, since he happily embraces the Stoic (or at least Stoic-influenced) treatment of causal agency as involving categorially distinct stages. There are antecedent causes, external influences brought to bear on objects (or physical systems), which may, if they are suitably disposed, trigger in them a sequence of events leading to the establishment of some further condition (for example, disease). But antecedent causes are not on their own sufficient for their effects; they operate only on patients in a suitable condition, and even then their progress may, if caught early enough, be arrested. For they set in motion processes within the organism, a sequence of preceding causes, which then culminate (unless appropriate action has been taken) in a set of conditions both necessary and sufficient for the disease in question, as well as being contemporary with it: the so-called ’containing’, or sustaining, cause.

Thus Galen’s detailed account of causal efficiency involves a wholly un-Aristotelian concentration on the sequential nature of causation as a temporal phenomenon; and, in addition to being of sufficient complexity and sophistication to defuse sceptical objections, it allows him to build up a detailed theoretical account of the structure of human pathology.

4 Reason and experience

Galen's commitment to theory places him in the Rationalist camp (see Hellenistic medical epistemology); but he insisted with the Empiricists upon the importance of testing, and sought to effect a reconciliation: theory without experience was empty, but experience without theory, blind. He emphasizes the importance of practical engagement in physiology and medicine; of regular, repeated observation and experiment; but he also believes that such observation is hamstrung unless it can be placed within its appropriate theoretical context. Students of medicine must make repeated dissections and vivisections in order to learn the structure and arrangement of things in the body; but they must also learn to sytematize those observations by attending to logic, and to understand them in nature's teleological light.

The basic theoretical categories he adopts, the four qualities, while not directly equivalent to their phenomenal counterparts, are still susceptible of empirical appreciation. Chilled white wine is, surface indications notwithstanding, hot and dry, since its effect is to heat and desiccate. Empirical testing, the main tool in the Empiricist context of discovery, is equally essential for Galen, but rather in the context of justification. The theories elaborated by reason on the basis of observation must themselves answer at the tribunal of experience.

Galen never abandons his belief (stated in the opening books of *On the Therapeutic Method*) that medicine can be made into an Aristotelian demonstrative science, where necessarily true theorems flow ineluctably from indubitable axioms, which include definitions stating the essence of things as well as fundamental logical and metaphysical principles, such as the law of the excluded middle and the principle of causality. Yet for such a science to be of practical use, it must be applicable to contingent circumstances, and pass stiff empirical tests. Moreover, given the diversity of circumstances, practical medicine will never be infallible; but if it is probabilistic, it is so not because of any intrinsic uncertainty in nature itself, but only because of our own inabilities to see clearly or accurately enough into it.

Galen insisted on the importance of training in logic, for systematizing empirical evidence and exposing others' fallacies. He made use of Stoic as well as Aristotelian argument schemata (although not uncritically: he rejects the Stoic third 'indemonstrable' (see Stoicism §11) as incapable of delivering necessary conclusions); and he saw more clearly than either school that neither system could handle relations properly, a deficiency he sought, albeit rather naïvely, to remedy with an account of 'relational syllogisms'.

Galen was not overly sanguine about knowledge; indeed he held that many of the disputes of the theoretical philosophers and cosmologists, over the nature of the soul or the existence of an extra-mundane void, were simply undecidable, since reason alone cannot decide them and neither is there any relevant experience to be won regarding them. But where they can operate, the sense-organs are 'natural criteria'; and nature does nothing in vain. Thus animals must naturally be able to assimilate perceptible form, and no inductive problem of the sort which plagues empiricist accounts of concept-formation arises. Equally, scepticism is refuted by teleology. It is by analysis of these naturally arising conceptions that we may, if we are able and conscientious enough, arrive at the real, definitional principles of things upon which all genuine, scientific knowledge is based.

R.J. HANKINSON

List of works

Galen (*c.* AD 150-210) *Opera omnia*, ed. C.G. Kühn, Leipzig: Knoblauch, 1821-33.(Greek text with Latin translation; Galen is standardly cited by volume and page number from this edition.)

Galen (*c.* AD 150-210) *Selected Works*, trans. P.N. Singer, Oxford and New York: Oxford University Press, 1997. (A broad range of works.)

Galen (*c.* AD 170) *On the Function of the Parts*, trans. M.T. May, *Galen on the Usefulness of the Parts of the Body*, Baltimore, MD: Johns Hopkins University Press, 2 vols, 1967.(Translation with useful notes of Galen's defence of natural teleology.)

Galen (*c.* AD 175) *On the Therapeutic Method, Books I and II*, trans. R.J. Hankinson, Oxford: Oxford University Press, 1991.(Translation and commentary, with introduction and notes, of Galen's most extended discussion of scientific method.)

Galen (*c.* AD 175) *On Antecedent Causes*, trans. R.J. Hankinson, Cambridge: Cambridge University Press, 1998. (New edition, with translation, commentary and general introduction, of Galen's important short treatise on causation.)

Galen (*c.* AD 175) *On the Doctrines of Hippocrates and Plato*, trans. P.H. De Lacy, *Galeni de Placitis Hippocratis*

et Platonis, in *Corpus Medicorum Graecorum* V 4 2 1, Berlin: Akademie-Verlag, 3 vols, 1978-83.(Magisterial edition and translation, with short commentary, on Galen's great text.)

Galen (*c.* AD 178) *On Prognosis*, trans. V. Nutton, *Galeni de Praecognitione*, in *Corpus Medicorum Graecorum* V 4 2 1, Berlin: Akademie-Verlag, 1979.(Fine edition, with commentary, of an interesting text in which Galen recounts many of his early medical triumphs in Rome.)

Galen (*c.* AD 190, 195, 150) *Three Treatises on the Nature of Science: On the Sects for Beginners, An Outline of Empiricism, On Medical Experience*, trans. M. Frede, Indianapolis, IN: Hackett Publishing Company, 1985. (Clear translations of three key short works on medical methodology, with an excellent introduction.)

Galen (*c.* AD 195) *On Anatomical Procedures*, trans. C. Singer, Oxford: Oxford University Press, 1956; later books trans. W.H.L. Duckworth, Cambridge: Cambridge University Press, 1962.(Complete English version of Galen's major treatise on anatomy.)

Galilei, Galileo (1564-1642)

Galileo Galilei, one of the most colourful figures in the long history of the natural sciences, is remembered best today for two quite different sorts of reason. He has often been described as the 'father' of modern natural science because of his achievements in the fields of mechanics and astronomy, and for what today would be called his philosophy of science, his vision of how the practice of science should be carried on and what a completed piece of natural science should look like. While none of the elements of that philosophy was entirely new, the way in which he combined them was so effective that it did much to shape all that came after in the sciences. In the popular mind, however, as a continuing stream of biographies attest, it is his struggle with Church authority that remains the centre of attention, symbolic as it is of the often troubled, but always intriguing, relationship between science and religion.

1 Life and works

Born in Pisa, Galileo enrolled in 1581 in medicine at the University of Pisa. But his interests lay rather in mathematics and he left the university without completing a degree. He continued his work in mathematics, however, and obtained a teaching post in mathematics and natural philosophy at Pisa in 1589. To aid his teaching, he composed several commentaries on standard logical topics in the Aristotelian curriculum of the day, drawing heavily (as Wallace (1992a) has persuasively argued) on class-notes from lectures at the Jesuit Collegio Romano. Around this time, he also composed a treatise on motion which departed from Aristotle in some significant respects, but supported Aristotelian doctrine against its critics in the main, holding, for example, that the speed of natural fall, after a brief initial period, is constant and that the motion of a body on a frictionless plane will eventually cease.

In 1592, he gained a teaching position at the University of Padua, then perhaps the leading centre in natural philosophy. There he continued his work in mechanics along lines that diverged more and more from Aristotelian norms. Aided by experiments with an inclined plane, he concluded that free fall is uniformly accelerated. The mathematics of uniform acceleration had already been explored by the Merton school at Oxford (see Oxford Calculators); Galileo applied this mathematics to falling motion, with the crucial proviso that the motion be idealized by supposing the resistance of the medium to be removed. There is evidence, as Drake and others have shown, that he also discovered the parabolic shape of projectile motion by empirical means at this time.

In 1609, Galileo turned his newly constructed telescope to the skies and in the short space of a few years made a series of remarkable discoveries that altogether changed the direction of his researches and of his life generally. He announced the earth-like nature of the lunar surface, the existence of sunspots and the apparent axial rotation of the sun, the four moons of Jupiter (which he named the 'Medicean' planets in honour of the Medici ruler of Florence, Cosimo II) and the phases of Venus which showed it to revolve around the sun. His first book-length publication, the *Sidereus Nuncius (The Starry Messenger)* (1610), was an instant best-seller, provoking heated debate. His new-found fame led to the appointment he had so eagerly sought, as court mathematician and philosopher to Cosimo.

Galileo's discoveries definitively undermined the Aristotelian geocentric world-system (see Cosmology). Though he took this to affirm its Copernican rival, there was, in fact, another alternative, the Tychonic model which had the planets orbit the sun and the sun in turn revolve around an immobile earth. Galileo's intuitions led him to reject this model as dynamically absurd, but it was greeted warmly by those who wanted to maintain the stability of the earth either for physical or for theological reasons.

Galileo soon found himself opposed not only by his beleaguered Aristotelian colleagues but by the theologians whose aid the latter solicited. A number of biblical passages referred, directly or indirectly, to the motion of the sun or the stability of the earth. In a letter to his former student Benedetto Castelli, and in a much longer *Letter* (1615) addressed nominally to Cosimo's mother, the dowager Grand Duchess Christina, Galileo formulated a set of hermeneutic principles addressed to cases where science and Scripture appear to clash. All of the principles found a precedent, he emphasized, in St Augustine's *De Genesi ad litteram*. But his arguments were in vain. In 1616, the Roman Congregation of the Index banned Copernicus' *De revolutionibus*, until the passages implying the reality of the earth's motion and the sun's rest should be 'corrected', and asserted in passing that the

Copernican theses, taken literally, were ‘contrary to Scripture’. Galileo was summoned before Cardinal Bellarmine and warned to abandon the Copernican claims. Whether he also received the further injunction not to teach, defend or even discuss the Copernican theses, which was to be delivered only if he proved recalcitrant, has been much debated; the documentary evidence on this issue is clouded.

Burdened by recurrent illness, Galileo returned to the astronomical topics he had already addressed in his *Letters on Sunspots* (1613). He turned now to comets and engaged in an increasingly contentious dispute about their nature with the Jesuit natural philosopher Orazio Grassi, culminating in the publication of *The Assayer* (1623). It was here that Galileo broke entirely with Aristotelian natural philosophy, maintaining that the Book of Nature is written in the language of mathematics, that the qualitative properties of sensible objects are merely subjective, and that matter is composed of imperceptible corpuscles.

In 1623, Galileo’s friend, Maffeo Barberini, was elected Pope as Urban VIII. In a series of interviews with the new Pope, Galileo won an evidently reluctant permission to proceed with a treatise on the Copernican system, provided it be treated as a hypothesis. The traditional understanding of mathematical astronomy was that mathematical ’hypotheses’, like those of Ptolemy and Copernicus, were to be regarded as convenient predictive devices only. Furthermore, for theological reasons rooted in the earlier nominalist-voluntarist tradition, Urban himself maintained that the underlying causes of a physical phenomenon could never be established demonstratively, as the Aristotelian notion of science required, since God could always bring about the phenomenon by other hidden means. But Galileo evidently considered himself licensed by Urban to argue for the possible *truth* of the Copernican claims, understanding ’hypothesis’ now in a very different sense, a sense closer to the modern one. And so he began work on a treatise that would make the best case possible for Copernicanism, stopping short only of claiming it had been demonstrated. After a lengthy struggle with the ecclesiastical censors in Rome and in Florence, he was finally permitted to publish the *Dialogue Concerning the Two Chief World Systems* in 1632.

The book immediately encountered strenuous opposition from Roman theologians, most particularly from the Pope himself, principally on the grounds that it contravened the decree of 1616 declaring the Copernican doctrine to be contrary to Scripture. The Pope ordered Galileo to be brought to trial before the Holy Office in 1633. Found ’suspect of heresy’, he was ordered to recant. After his recantation he was sentenced to imprisonment, commuted to house arrest.

Deeply discouraged and forced to abandon his cherished project of showing that the Church had nothing to fear from Copernicanism, Galileo returned to the treatise on motion he had commenced long before in Padua. It still needed to be given a literary form, and a properly axiomatic structure had to be found for the two laws of motion. The completed manuscript was smuggled to Holland and the *Two New Sciences* was finally published in 1638. It announced ’a brand new science concerning a very old subject’, and set forth in elegant geometrical form his two laws of motion. It was his final testament, one that would ’open wide a gateway’ for the labours of others, as he prophesied that it would.

2 The practice of natural science

The most striking feature of Galilean science was its emphasis on *mathematization*. Not only did it treat quantity to the exclusion of quality, but quantity itself was assumed to be expressible in purely geometric terms. Time was represented as a line, and velocity, instead of being treated in the traditional way as an irreducible ratio between distance covered and time taken, was presented as a mathematical quantity in its own right. Galileo’s two laws were both purely kinematic; they simply described motion. Quantities like mass or force would not have lent themselves to the simple sort of geometrization that length and time allowed. (Descartes achieved a similar geometrical reduction by equating matter with extension.) Furthermore, the axiomatic mode of presentation customary for geometry encouraged Galileo (as it later did Newton) to adopt a similar mode for mechanics. Galileo’s success in dispensing with weight and resistance of the medium, the two non-geometrical factors determining velocity in older accounts of falling motion, may have led him to be over-optimistic about the prospects for a reductively geometric science of motion. But his resolute move to mathematically expressible quantities as the proper basis of physics was to prove its long-term worth.

What made both of his laws possible was his decision to *idealize*, that is, to extrapolate to the (at the time empirically unachievable) case of *in vacuo* fall. The medium invariably present in actually observed fall was to be

treated as an ‘impediment’, a complicating factor that should as far as possible be eliminated, in order to focus on the ’pure’ case of fall. Though conceptual idealization was not new in natural philosophy, finding a precedent especially in the work of Archimedes, the construction of deliberately simplified material situations was a distinctively Galilean contribution to the science of motion. Galileo was convinced that it would lead to the mathematically simple laws that lie hidden beneath the complexities of natural process. This aspect of his practice has often been described as ’Platonic’, but it runs contrary to the Platonic conviction that the sense-world, far from being ’written in the language of mathematics’ as Galileo’s famous slogan ran, lends itself only imperfectly to the intelligibility of mathematics.

Idealization of this sort, opposed even more to Aristotle’s way with nature, finds material expression in *experiment*. Galileo had to contrive situations that would reveal how selected physical factors would relate to one another in the absence of disturbing causal influences, such as friction. Though his inclined-plane experiment became a model for later emulation, it must be added that he could, on occasion, manifest a rather casual attitude towards experimental warrant. His allusions to experiments sometimes appear as rhetorical devices rather than as reports of actual performance. Koyré (1940) claimed, indeed, that Galileo rarely performed the experiments he describes, that these were no more than thought-experiments resting on his own powerful intuitions (see Thought experiments). Recent work on Galileo’s work-notes has shown this to be exaggerated. Galileo undoubtedly sought support for his new science in repeated observation.

This in turn required specially-designed *instruments* to supplement the testimony of the unaided senses. The new emphasis on mathematically expressible quantities meant that a degree of precision would be needed that the senses alone could never achieve. Furthermore, instruments such as the telescope and the microscope could extend the very notion of observation to realms the senses could not reach. Instruments could even be devised to measure quantities, like the ’strength’ of magnets, that escape the senses entirely. A significant part of Galileo’s success lay in his talent for improving instruments already in use, or for constructing instruments of entirely novel kinds. The new science would depend heavily on technological skills, a feature entirely alien to natural philosophy in the Greek tradition (see Experiment; Scientific method).

This novel complex of practices gave the new science an immediate degree of autonomy relative to the rest of philosophy. Thus began the long and often painful process of separation between two disciplines that had up to this point been considered as one. The ridicule that Galileo often directed to ’the philosophers’ was clearly meant for Aristotelian philosophers, not for philosophy itself. He had, after all, insisted on the title of ’Philosopher’ when he joined the Medici court, in part to ensure that his work would not be dismissed as mere ’mathematics’. How would he have regarded the redefinition of philosophy itself that his work did so much to set in train, had this been presented to him? Despite what some historians have claimed, he was not a positivist in the making. His conception of science as a structure of ‘necessary demonstrations’ leant as much to a past when the principles of natural philosophy carried their own intuitive self-evidence as to a future when scientific theories would be warranted primarily by their observational consequences.

3 The conception of science

Given the marked shift in scientific practice represented by Galileo’s mature work, one might have expected that his conception of what makes a knowledge-claim truly scientific would have altered correspondingly. But in this respect, he stayed close to the Aristotelian ideal absorbed in his youth. His new science departed in one important respect, of course, from the earlier conception: it was mathematical, not syllogistic, in form. But this made it *more* scientific in his eyes, not less. Indeed, it made it equal in certainty to God’s own knowledge. His opening promise was that his science ’ would prove demonstratively, and not just persuade by probable arguments’ (1638: 16). And the familiar Aristotelian phrase, ’necessary demonstration’, is dotted throughout his writings. He contrasts the probable mode of argumentation characteristic of the humanities with the demonstration proper to the natural sciences ‘ whose conclusions are true and necessary, and have nothing to do with human will’ (1632: 53).

But how could he make good on this claim? In demonstration, the inference proceeds deductively from the premises, which must be seen to be true and necessary in their own right; whereas in an observational science the order is reversed, since inferences proceed backwards, as it were, from observed particulars to (universal) premises. The warrant for the postulated premises lies in the consequences drawn from them, not in their own self-evidence. Such an inference cannot be deductive, it would seem, unless the observed particulars can somehow

prompt the mind to formulate a universal principle. This had been Aristotle's doctrine of *epagōgē*, extensively elaborated by Galileo's predecessors in Padua as a 'demonstrative regress' from observation to principle and back down to observation. Could an investigation relying on experiment fit this model? Galileo seems, at times at least, to have thought so.

Contrary to a once-popular presumption, Galileo was no inductivist. He would never have supposed that, for example, observation alone could establish as a *principle* that projectile motion follows a parabolic path. The material world, he remarks, is too full of potentially disturbing factors, and observation itself is always subject to correction. Instead, one would have to show either that the parabolic law is a principle in its own right or that it follows from other such principles. Primary among these latter, of course, would be the law of free fall, described as ' the simplest and most evident rule' (1638: 154). But how can one be sure that nature actually follows this rule? Galileo concedes that this has to be 'confirmed' by experiment. But if that is so, can the supposed 'principle' exhibit the necessity that the starting point of strict demonstration demands? Galileo was well-aware of this difficulty and hedged his claim in phrases like ' little short of necessary demonstration', 'worthy of being conceded as if demonstrated' (1638: 162, 164). The tension here between two very different conceptions of science, one demonstrative, the other hypothetical, is evident.

The axiomatic structure of his mechanics undoubtedly encouraged him, if encouragement was needed, in his retention of the language of demonstration. Regarded purely as mathematics, his mechanics could be called 'demonstrative', though admittedly in a weaker sense of that term, a sense that Galileo often exploited. In response to critics after the publication of *Two New Sciences*, he could claim to have 'demonstrated conclusively' what the properties of uniformly accelerated motion were, 'on the supposition' (*ex suppositione*) that falling motion actually *is* uniformly accelerated in nature. This allowed him to affirm that the reasoning would remain 'demonstrative' even if experiment were to show that downward motion does not quite conform to the supposition (Letters to Baliani and de Carcavi, *Opera*, XVIII: 12-13; XVII: 90). The retreat to an *ex suppositione* claim, however, was equivalently, to open the possibility that his mechanics, considered as *physics* rather than just as mathematics, could claim only a hypothetical warrant. Or else it was to assume that experimental discrepancies can be disregarded in such a case because of the inherent messiness of the causal order impeding the operation of the 'pure' physical principles. But *ought* one to rely on intuition in this way, especially in the face of counter-evidence? This was the challenge that defenders of the traditional regress model of proof had never really been able to handle.

The question of *why* bodies fall as they do was expressly laid aside; had it been acknowledged, even the appearance of demonstration could hardly have been maintained. But elsewhere in his inquiries, notably in his cosmology, the quest for agent-causes could not be avoided. What was the nature of the lunar surface, of comets, of sunspots? The only way to answer questions like these about natures that were not immediately accessible was to postulate in hypothetical fashion causes that would explain the observed effects. This sort of inference could never fit the mould of strict demonstration. The natures of these distinct objects could not become the subject of self-authenticating principle, and effect-to-cause reasoning inevitably leaves open the possibility of alternative explanations that might fit the data equally well. Galileo tried to limit this latter difficulty by proposing that for any given effect there should be one unique 'true cause'. But it was difficult to deny that in practice, in his detailed argument for the earth-like character of the lunar surface, for example, he was proposing a plausible hypothesis whose epistemic status depended on its being confirmed by the verification of consequences drawn from it (see Inference to the best explanation).

Galileo's attachment to the notion of demonstration was such that he never really came to terms with the notion of hypothesis. Unlike others of his day (Kepler, Descartes and Boyle immediately come to mind), he did not concern himself with the question, urgent in a science that argues from observed effects to unobserved agent-causes, of how the credentials of an explanatory hypothesis are to be assessed. This was to prove a critical weakness in his attempts to prove the reality of the earth's double motion, the key to the Copernican debate. His opponents, both the Aristotelian philosophers and the Roman theologians, insisted, for different reasons, on the standards of demonstration. And Galileo on his own account was not disposed to challenge these standards. But lacking demonstration of these motions, as he rather evidently did, what lesser status could he claim for the Copernican theses? The hesitant language in which he couches his conclusions in *Two Chief World Systems* betrays not only the theological dilemma in which he found himself, but also a lifelong reluctance to allow properly 'scientific'

status to anything less than demonstration.

4 Theology and science

In conclusion, something should be said about his theological dilemma. What the Church was at pains to defend throughout the Galileo affair was not so much the Aristotelian worldview, as has often been supposed, as the authority of Scripture and the Church's own authority as its interpreter. Had the handful of references in Scripture to the motion of the sun or the stability of the earth not been present, as they might well not have been, the Church would have been unlikely to become so forcefully involved in the Copernican debate. Furthermore, had the debate itself come a century earlier or a century later, a major confrontation might well have been avoided. But this was the age of the Counter-Reformation, when one of the principal issues in dispute between Protestants and Catholics involved hermeneutics: how was Scripture to be interpreted, and who had the authority to interpret it? And here was a layman affirming on his own authority (so it would have seemed in Rome) a nonstandard interpretation of biblical passages. No matter that he could advance good arguments in favour of his interpretation and even cite the authority of one of the greatest of the Church's own theologians on behalf of the principles of interpretation he employed, it was still not to be borne that such a challenge should go unanswered.

Galileo's *Letter to the Grand Duchess* has been described as one of the most effective pieces of theological writing of its century, an ironic assessment, given the lay status and the later fate of its author. Had its arguments been heeded, the fateful 1616 decree of the Congregation of the Index, effectively outlawing the Copernican theses as contrary to Scripture might never have been penned. Or would it? There was a hidden tension between the hermeneutic principles Galileo advanced, a tension to be found likewise in the Augustinian principles he appealed to. On the one hand, Scripture, was held to have no bearing on matters of natural science; these latter were said to lie outside its concerns entirely. On the other hand, where the literal reading of Scripture appears to conflict with a scientific finding, his principles implied that this latter finding has to have the status of demonstration in order to warrant the search for a different reading of Scripture.

The implications of these two directives were quite different for the Copernican debate. Were one to be guided by the first, the status of the scientific arguments for the Copernican theses would be irrelevant; the debated biblical passages mentioning sun and earth would have no scientific standing in the first place. Were one to be guided by the second, the Copernican theses would have to be demonstrated. How crucial the difference is needs no emphasis. Galileo's opponents, notably Cardinal Bellarmine in 1616, adhered to the second and more traditional directive, and demanded demonstration before they would consider a reinterpretation of the Scriptural passages along less literal lines. Galileo himself evidently favoured the first principle, which would have absolved him from the necessity of providing a demonstration of the earth's motion that he simply did not have. To defenders of the second approach (the probable arguments Galileo advanced) arguments that carried weight, though admittedly not conclusive weight with his fellow scientists, were of no avail. And Galileo's own hesitations about the epistemic status of such arguments complicated matters further.

The complexities of character and political circumstance that propelled the Galileo affair continue to fascinate modern readers. But it should also be said that this event, one of the greatest moments in human affairs, hinged to no small extent around an issue in philosophy of science.

motion.)

Gandhi, Mohandas Karamchand (1869-1948)

Gandhi was called Mahatma *(the Great Soul) by Rabindranath Tagore and many in the West, while Gandhi's followers often simply called him* Bapuji *(Father). His confrontation with racism in South Africa provided a challenging context for the development of his idea of* satyāgraha *(holding fast to the truth), a method of nonviolent, noncooperative resistance to the authorities. Influenced by several religious traditions, such as Hinduism (especially Vaishnava), Jainism, Islam and Christianity, Gandhi was both a religious thinker and practical reformer. While in jail on several occasions, he wrote prolifically. He was murdered on 30 January 1948 by a Hindu zealot.*

1 Life and career

Gandhi was born on 2 October 1869 in Porbandar, Kathiawad to a politician father, Karamchand Uttamchand and a religiously devout mother, Putalibai. At the age of thirteen an arranged marriage took place between Gandhi and Kasturbai, although he was later to oppose child marriage. Educated in India and London, Gandhi passed his bar examination with ease, enrolled at the High Court on 11 June 1891 and sailed for India the following day. After a brief and unsuccessful attempt at law in India he went to South Africa, initially to represent the interests of a Muslim firm. From 1893-1914 Gandhi struggled against racism in South Africa.

Gandhi returned to India in 1915 to engage in a struggle with the British for *swarāj* (self-rule). He lived a life of simplicity and renunciation and used the method of fasting to the brink of death as a way of persuading opponents.

The Amritsar massacre of 1919 was decisive in Gandhi's rejection of British colonial rule in any form. *Khādī*, white home-spun cotton clothes and *charkha*, the spinning wheel, became Gandhian symbols. *Charkhas* were difficult to find, as they were rare among the professional elite in Gandhi's time, and the making of *khādīs* had to be learned.

2 Truth, religion and politics

Gandhi made his first public speech on truth in business dealings in Pretoria, South Africa. He believed in both 'truth of statement' and the notion of 'truth of being'. He was preoccupied with truth and felt it must be expressed in a life of *ahiṃsā*, or non-injury (which entails vegetarianism). He always saw the divine in the less fortunate (for instance by opposing untouchability). Gandhi believed that a *satyāgrahī*, one 'steadfast in truth', ideally must exemplify celibacy (following the vow of *brahmacarya*). Only then could the *satyāgrahī* rise above all passionate attachments and generate enough internal 'heat' (*tapas*) to do battle with untruth. Gandhi's goal was one of serving the public rather than only achieving his individual salvation. He was motivated by the ideal of *sarvodaya*, the welfare of all (see Duty and virtue, Indian conceptions of).

Gandhi appropriated the term *sadāgraha* and changed it to *satyāgraha* (holding fast to the truth), with *satya* representing truth and *āgraha* firmness. In *An Autobiography, or the Story of My Experiments with Truth* (1927) Gandhi spoke of truth as an underground mine holding many opportunities for service. Proposing that 'there is no other God than truth', Gandhi understood divinity as immanently realizable through dedicating one's work to God. In Hindu tradition this idea is *karma yoga*. For Gandhi *karma yoga* meant a dedication to truth in each particular case, rather than in mystical contemplation of an abstract Godhead. He often appealed to 'the Voice' of conscience wherein God speaks. Accepting the principle of *karma* and the doctrine of transmigration, Gandhi hoped to be reborn an untouchable to be of further service.

In *An Autobiography, or the Story of My Experiments with Truth* (1927), Gandhi revealed that he was not well-versed in Sanskrit and the Hindu classics at the time when the the role of guru was thrust upon him by the public. His 'philosophy of religion' was confessional in form, not analytical. He thought at a metareligious level, believing that all religions participate in truth. The Sermon on the Mount, the *Bhagavad Gītā* (which Gandhi himself translated) and the writings of Tolstoi were sources of particular fascination for him. The Jain doctrine of *ahiṃsā* (non-injury) was one of his main tenets and provided the background to his vegetarianism (see Jaina philosophy). His close friend C.F. Andrews supplied a Christian stimulus in his life, but Gandhi found deeper inspiration in his native *Bhagavad Gītā*. Self-purification and dedication to God through service to humanity provided the basis for religiosity according to Gandhi. For Gandhi, religion must bind together humankind and

include politics. There were no particular religious images in Gandhi's *ashram*. With the knowledge that God has many names, several scriptures were recited in the daily routine. In this way Gandhi's practice exemplified the tolerance of Jain *syādvāda*, the view that all judgments of nonomniscient beings must be qualified by 'somehow' or 'perhaps' (see Manifoldness, Jaina theory of). Gandhi was influenced by Jainism from early on. Philosophically, his position expressed a reverence for life characteristic of both Jainism and Buddhism. He disputed the notion that Buddhism is atheistic, preferring to interpret Buddhist *dharma* in the sense of 'truth' as representing God. In his view, religion at its best is concerned with human community and the transcendence of cultural tribalism and parochialism.

Gandhi's goals were the achievement of *sarvodaya*, sovereignty and self-sufficiency in India, encompassing the idea of teaching in native languages. Although untouchability and child marriage were vigorously opposed as they oppressed the less fortunate and defenceless, Gandhi defended stratification in terms of *varṇa* in the limited sense of the division of labour. He was also opposed to individualistic capitalism. Education was important to Gandhi, and he thought that colleges should be linked to particular industries. Like Martin Luther King, he did not offer a theory of justice, but believed, as King was later to say: 'injustice anywhere is a threat to justice everywhere'.

Gaōgeśa (*fl. c.*1325)

Gaōgeśa launched and solidified advances in logic and epistemology within the classical Indian school of Logic, Nyāya. He is traditionally taken to have inaugurated the 'New' school, Navya-Nyāya. Nyāya, both Old and New, is a multidimensional system that belies the stereotype of Indian philosophy as idealist and mystical in orientation. Gaōgeśa worked with a realist ontology of objects spoken about and experienced every day. He articulated what may be called a reliabilist theory of knowledge: under specified conditions, sense-mediated and inferential cognitions (along with two other types) are reliable sources of information about reality.

Gaōgeśa was a pivotal figure in classical Indian philosophy; most later debate both within his school and outside it presupposed cognitive analyses that he standardized. These analyses focus on properties exhibited by things known, properties central to the processes whereby they are known. Properties relating the cognized to the cognizer are especially important. Though Gaōgeśa had a lot to say about the ontological status of these properties, others in his school found them problematic. Such controversy appears to have contributed to New Logic's success: proponents of rival views were able to utilize Gaōgeśa's formulas and definitions without abandoning their own positions on what is real.

1 Historical particulars

Gaōgeśa Upādhyāya lived in the first half of the fourteenth century, in Mithilā, in northern India, where he was a prominent teacher. Gaōgeśa's school of New Logic remained a Mithilāmonopoly for almost two hundred years; students travelled there to learn the system and returned with it to their own regions. Within another century, New Logic came to dominate late classical thought all over India, influencing jurisprudence and aesthetics as well as shaping the philosophical scene. But unfortunately we know Gaōgeśa the person almost exclusively as the author of a single work, the *Tattvacintāmaṇi (Jewel of Reflection on Reality)*.

The *Tattvacintāmaṇi* is New Logic's root text. Numerous commentaries were written on it, and all later New Logic writers presupposed its acquaintance. It is without question one of the premier works of the whole of classical Indian thought. The *Tattvacintāmaṇi* contains the distilled reflections of generations of earlier philosophers, mainly within the sister schools of Nyāya and Vaiśeṣika (see Nyāya-Vaiśeṣika), but also arguments of historic opponents of these two complementary realist views. Gaōgeśa's originality is in fact less than one might expect given the acclaim for his *Tattvacintāmaṇi*. He himself recognizes Udayana (*fl. c.*1000), and rightly so, as the innovator of positions characteristic of the New Logic movement. But Gaōgeśa does refine the Logic understanding of the cognitively veridical and nonveridical (among other things), and it is here that he has his greatest influence on subsequent Indian thought.

The *Tattvacintāmaṇi* comprises four chapters, each devoted to a separate source of right cognition: veridical perception, cogent inference, analogical vocabulary acquisition, and reliable testimony. Within each chapter there are clearly delineated sections on various subtopics, including reflections, mainly in the first chapter, concerning cognition and veridicality in general, considered independently of particular instruments. Gaōgeśa is lucid and precise; he argues forcefully, ingeniously leading the reader into positions by careful examination of alternatives.

2 Perception and inference

Cognition (*jñāna*, often translated 'awareness') is the most important item in Gaōgeśa's philosophy. Ontologically, cognitions are short-lived, episodic attributes or qualities of the self or soul, and, in the case of sensory awarenesses, are causally continuous with physical realities as a result of the relations between sense organ and object. A cognition may be understood as a mental event, but it is a product or state rather than an act. Cognitions are intentional; they are invariably *of* some object or objects, or, more precisely, objective complex(es).

Gaōgeśa posits sensory cognitions below the level of what we can consciously articulate; these are called indeterminate cognitions, by contrast with the determinate. Every determinate cognition is verbalizable, but indeterminate cognitions are not. Even the simplest verbalizable cognition has an object that is ontologically complex: that is, a qualificandum is cognized through one of its qualifiers in the case of a veridical awareness. It is to avoid an infinite regress of qualification that Gaōgeśa posits indeterminate cognition, where qualifiers are

directly known. Otherwise, there would be the problem of how a $qualifier_1$ of $qualificandum_1$ is known; that is, if the qualifier had to be itself a qualificandum, $qualificandum_2$, to be known through another qualifier, $qualifier_2$, for anything to be known, there would have to be an infinite series of qualifiers and qualificanda. Thus some qualifiers are cognized directly though indeterminately.

Indeterminate cognition is said to give rise to determinate cognition through a causal process. Although acquaintance with an individual is determinate, it should be thought of as causally direct: perception is a causal process spread over time, and indeterminate cognition may be viewed as a first phase. Verbalizable cognition of an individual is mediated by - or, better, fused with - what the individual appears as. Only determinate cognition is verbalizable, in that its content is expressible in propositional form as something, *a*, being an *F* (*Fa*).

All simple (non-doubly, triply, and so on) qualificative or determinate cognitions have a content that exhibits a common structure: qualificandum, qualificative relation, qualifier (*a*-*R*-*b*). Qualification is a relational property that obtains in the world, but it is used to talk about cognitions. The simplest veridical sensory cognition reflects a fact or state of affairs, an individual cognized (the qualificandum) as related to a qualifier. With the veridical awareness '(A) pot', for example, we would have the particular pot- inherence-potness as the objective complex (*a*-*R*-*b*) cognized as something appearing as a pot. The qualificandum is the bearer or possessor of properties; with the veridical awareness '(A) pot', the particular pot is the subject of qualification and possesses the property of potness. The awareness '(A) pot' has 'potness' as its predication content.

With this apparatus, Gaōgeśa is able to analyse nonveridical sensory awareness as a cognition whose predication content does not qualify the object cognized, that is, the object that stands in relation to the sense organ. A causal story is to be told why there is such a foul-up, why something appears as other than it is, a story that will vary with the circumstances of individual instances of error (see Error and illusion, Indian conceptions of §3).

Inferential knowledge is defined by Gaōgeśa as the cognition arising as the result of the perceptual cognition of something *a* as possessing a property *F* that is understood as pervaded by (or invariably concomitant with) another property *G* (*F* as invariably co-located with *G*). To quote Gaōgeśa: 'Inferential knowledge is cognition generated by cognition of a property-belonging-to-a-locus-and-qualified-by-a-pervasion' (*Tattvacintāmaṇi*, 1982: 5; the dashes in the translation are to indicate that the cognition has to have all this as content). Logicians throughout the history of their school are concerned with inference only in so far as it provides knowledge of the world. Thus any correct inference must have a perceptual premise, which is its starting point, so to speak: for example, 'There is smoke on yonder hill', as known perceptually. (Perceptual cognition may be said to be the premier knowledge source in another way as well: inferential cognitions that are *prima facie* correct can be overridden by sensory awareness.) But of course it is not just any perceptual awareness that leads to inferential knowledge: for example, the smoke, or smokiness, as a qualifier of a locus or qualificandum must be seen as invariably related to another property called technically the property to be proved; it must be qualified by pervasion, or co-locatedness, with the property of being-fiery. Throughout New Logic it is the nature of the relation called pervasion (*vyāpti*, often translated 'invariable concomitance') that is the main focus of reflection under the general rubric of inference. Gaōgeśa considers and rejects a total of twenty-one definitions of pervasion. He accepts a total of five.

Among other important aspects of Gaōgeśa's epistemology is fallibilism, which feeds his response to scepticism concerning how a pervasion in its full generality can by known (occurrence of *G wherever* there is occurrence of *F*: how can this be known?). The answer is wide experience, but future experience could prove us wrong.

Gaōgeśa shows a pragmatic orientation in his final response to scepticism on this score. The sceptic's behaviour gives the lie to the complaint: does the sceptic not, for example, in voicing the complaint, assume a *vyāpti* between speaking and others' comprehension?

3 Ontology

Like all Nyāya ontology, that of Gaōgeśa's *Tattvacintāmaṇi* is realistic in the sense of a commitment to entities whose existence is independent of consciousness. Realism led the philosophers of Gaōgeśa's Nyāya school to embrace fallibilism, because the transcendence, so to speak, of a physical object with respect to the instruments of knowledge means that the possibility of error cannot be ruled out. Gaōgeśa's definitional projects are attempts at philosophical characterization as opposed to linguistic analysis, because the various definienda (veridical

awareness, inference-grounding pervasion, and so on) are realities in the world, not linguistic items. Then regarding the backbone of Nyāya ontology - its categorial system - all individuals of whatever fundamental type (substances, qualities, motions, natural kinds, inherence, ultimate individuators, and absences) are viewed as reals.

Gaōgeśa's ontological labours are generally in the service of epistemology. Consonantly, his treatment of six 'operative relations in sense experience' is extensive. So also are his reflections on *vyāpti*, inference-underpinning pervasion. The material on *vyāpti* received an enormous measure of attention from later Logicians.

Depending on what is cognized - individual substance, quality, natural-kind character, an absence (for example, of my glasses on the table), a previous cognition (as in apperception), and so on - the relationality between the grasping and the grasped varies. Moreover, the different sense organs relate to objects differently. And there are special problems about the 'operative relation' in a perception of an absence, as well as with what in the West is known as the 'Bradley problem' of a possible infinite regress of relations centring on inherence as joining a quality to a substance (for example) - what then joins the inherence? The importance of the ontology of absence looms especially large because the acceptable characterizations of pervasion require mention of certain general types of absence. That characterization project also involves Gaōgeśa in explaining ontologically what 'co-locatedness' amounts to.

Gaōgeśa takes very seriously a principle of ontological parsimony (*lāghavatva*), and so his reasoning through all the complexities of a variety of desiderata and principles potentially in tension is at times tortuous. But it is invariably tight, and though later Logicians abandon some of his positions (Gaōgeśa sometimes appears too conservative, too intent on defending Udayana's ontological stances), his arguments form the problem space for later reflection.

Garrigou-Lagrange, Réginald (1887-1964)

Garrigou-Lagrange was a French Dominican who for decades adorned the Angelicum in Rome, where in his courses he commented closely on the Summa theologiae. The spiritual life was a principal interest of Garrigou-Lagrange, and many of his books are devoted to the theology and practice of mystical union with God. Impatient with theological novelty, Garrigou-Lagrange came to be caricatured by the champions of innovators. His own work, solid, careful, illuminating, is a monument to a golden period of the Thomistic revival.

Garrigou-Lagrange was an influential figure in the second phase of the revival of Thomism initiated by Pope Leo XIII's 1879 encyclical *Aeterni Patris*. He first studied medicine, then entered the Order of Preachers, where, after studying philosophy and theology, he began in 1905 a teaching career which was to last sixty years. He taught at Le Saulchoir, Belgium, until, in 1909, he was assigned to the Dominican university in Rome, the Angelicum.

Mentor of Jacques Maritain, *bête noire* of Étienne Gilson and Henri de Lubac, Garrigou-Lagrange was a Thomist of the strict observance. His writings, vast in number, fall into three main classes: philosophical, theological and spiritual. His theological work consists of commentaries on Aquinas, in which he follows the lead of the great commentators of the Dominican Order - Cajetan, John of St Thomas and Báñez - as well as original work in a Thomistic key. His spiritual writings deal with the progressive appropriation of the life of grace leading to mystical union with God. His philosophical works are of particular interest to the philosopher of religion.

In theory of knowledge, Garrigou-Lagrange was an ardent defender of the doctrine of Aquinas which, while taking due account of the contribution of our mind to the object of intellectual knowledge, sees that contribution as modal rather than substantive. The essences or quiddities that are the object of intellectual knowledge are those of really existing things. These essences are individuated in material substances and are universal and immaterial (modally) as known (see Aquinas, T. §11).

Garrigou-Lagrange's Thomism can best be sampled in the lengthy article he contributed to the *Dictionnaire de théologie catholique*, which became the basis for his book *La Synthèse thomiste (The Thomist Synthesis*, 1946). After a bibliographical introduction to the philosophical and theological works of Aquinas, Garrigou-Lagrange significantly discusses the Thomistic commentators. He saw his own efforts as a continuation of a tradition that had been broken and was to be renewed. The 'metaphysical synthesis of Thomism' concentrates on act and potency. The bulk of the work deals with Aquinas' explicitly theological doctrines, following the general plan of the *Summa theologiae*. It ends with a section devoted to the 'Twenty-Four Theses', a list of key tenets of Thomism which had been drawn up by several professors and approved by the Congregation of Sacred Studies as an adequate summary of Thomas' teaching, and a discussion of epistemological realism.

Garrigou-Lagrange's magisterial *Dieu, son existence et sa nature* (*God: His Existence and His Nature*, 1915) is a running debate with post-Kantian thought. Thus he defends the epistemological assumptions of proofs for the existence of God before giving a detailed analysis of Aquinas' Five Ways and discussing the divine attributes. Throughout, Garrigou-Lagrange indicates how Aquinas' views differ from those of major modern philosophers. The work ends with a discussion of the principle of inertia and conservation of energy, an indication of the author's concern to deal with apparent difficulties for the assumptions of the traditional proofs of God's existence. He also argues that agnosticism leads to atheistic evolutionism.

Other works of interest to philosophers of religion are *De de uno (The One God*, 1937), *La prédestination des saints et la grâce (The Predestination of the Saints and Grace*, 1936) and *Providence et la confiance en Dieu (Providence and Confidence in God*, 1935). *Le Sens commun (Common Sense*, 1921) is at once a defence of realism and an extended engagement with the thought of Bergson and with the Scottish Common-Sense school. Throughout, Garrigou-Lagrange recommends Thomistic positions as preferable to those of the rivals he examines. The work ends with criticism of the modernist interpretation of dogmatic formulas. *Le Réalisme du principe de finalité (The Realism of the Principle of Finality*, 1932) compares knowledge of natural and supernatural truths. The motto on the title page reads thus: 'Every being acts for an end, from the grain of sand to God. Our intellect knows its own finality: to judge in conformity with the nature and existence of things and to raise itself to their first cause and ultimate end.'

The style and approach of Garrigou-Lagrange have been deplored by some post-conciliar Catholics. This is in many ways unjust. He is an engaging writer, a thinker of great power, a Thomist who takes the thought of his master to be the answer to some of the twentieth century's more vexing philosophical divagations. But that, of course, was the message of *Aeterni Patris*.

Gassendi, Pierre (1592-1655)

Pierre Gassendi, a French Catholic priest, introduced the philosophy of the ancient atomist Epicurus into the mainstream of European thought. Like many of his contemporaries in the first half of the seventeenth century, he sought to articulate a new philosophy of nature to replace the Aristotelianism that had traditionally provided foundations for natural philosophy. Before European intellectuals could accept the philosophy of Epicurus, it had to be purged of various heterodox notions. Accordingly, Gassendi modified the philosophy of his ancient model to make it conform to the demands of Christian theology.

Like Epicurus, Gassendi claimed that the physical world consists of indivisible atoms moving in void space. Unlike the ancient atomist, Gassendi argued that there exists only a finite, though very large number of atoms, that these atoms were created by God, and that the resulting world is ruled by divine providence rather than blind chance. In contrast to Epicurus' materialism, Gassendi enriched his atomism by arguing for the existence of an immaterial, immortal soul. He also believed in the existence of angels and demons. His theology was voluntarist, emphasizing God's freedom to impose his will on the Creation.

Gassendi's empiricist theory of knowledge was an outgrowth of his response to scepticism. Accepting the sceptical critique of sensory knowledge, he denied that we can have certain knowledge of the real essences of things. Rather than falling into sceptical despair, however, he argued that we can acquire knowledge of the way things appear to us. This 'science of appearances' is based on sensory experience and can only attain probability. It can, none the less, provide knowledge useful for living in the world. Gassendi denied the existence of essences in either the Platonic or Aristotelian sense and numbered himself among the nominalists.

Adopting the hedonistic ethics of Epicurus, which sought to maximize pleasure and minimize pain, Gassendi reinterpreted the concept of pleasure in a distinctly Christian way. He believed that God endowed humans with free will and an innate desire for pleasure. Thus, by utilizing the calculus of pleasure and pain and by exercising their ability to make free choices, they participate in God's providential plans for the Creation. The greatest pleasure humans can attain is the beatific vision of God after death. Based on his hedonistic ethics, Gassendi's political philosophy was a theory of social contract, a view which influenced the writings of Hobbes and Locke.

Gassendi was an active participant in the philosophical and natural philosophical communities of his day. He corresponded with Hobbes and Descartes, and conducted experiments on various topics, wrote about astronomy, corresponded with important natural philosophers, and wrote a treatise defending Galileo's new science of motion. His philosophy was very influential, particularly on the development of British empiricism and liberalism.

1 Life and works

Pierre Gassendi was born in Champtercier, a village near Digne in Provence, France. He received his early education in Digne and Riez and was admitted to the clerical state in 1604. The remainder of his formal education was supervised by the Church, as it formed part of his preparation for the priesthood. From 1604 through 1611 he studied Aristotelian philosophy and Catholic theology at the college of Aix-en-Provence. Upon receiving his doctorate in theology at Avignon in 1614, he was appointed official diocesan teacher of theology and superintendant of theological education. In 1616 he assumed the chair of philosophy at Aix-en-Provence, where he taught Aristotelian philosophy for the next six years. He voiced his dissatisfaction with Aristotelianism in his first published work, *Exercitationes Paradoxicae Adversus Aristoteleos (Paradoxical Exercises against the Aristotelians)* (1624), in which he claimed to have taught his students the principles of Aristotelianism, only to refute them with sceptical arguments. When the college at Aix was turned over to the Jesuits in 1622, Gassendi and the rest of the faculty were forced to leave their positions. Since his student days, he had been a member canon of the Cathedral of Digne. He was appointed provost of the Cathedral in 1634, a position which he held for the rest of his life.

Apart from his administrative position at the Cathedral of Digne, Gassendi relied on patronage for his scholarly work. His first patron was the polymath and humanist Nicolas-Claude Fabri de Peiresc (1580-1637), councillor of the Parlement of Aix and patron of arts and letters. Gassendi and Peiresc conducted scientific experiments together and corresponded about astronomy and philosophy. During the years until Peiresc's death, Gassendi divided his

time among Aix, Digne, and Paris. During the winter of 1628, he travelled with his friend the *libertin érudit* François Lullier (*c.*1600-51) to Holland where he met a number of important intellectual figures, including the atomist Isaac Beeckman (1588-1637), who reinforced his resolve to restore the philosophy of Epicurus, an enterprise that became his life's work.

In 1630, Gassendi published two works not directly related to his Epicurean project. In the *Epistolica exercitatio, in qua principia philosophiae Roberti Fluddi, medici, reteguntur* he responded to Marin Mersenne's request for an evaluation of the natural philosophy of the Paracelsian Robert Fludd (see Mersenne). In the *Parhelia, sive soles quat[u]or qui circa verum apparuerunt Romae, die XX mensis martii anno 1629* he gave an account of a strange appearance of parhelia (or the appearance of multiple suns and patches of shimmering light around the sun). Two years later, in *Mercurius in sole visus et Venus invisa Parisiis anno 1631*, he confirmed Kepler's prediction of Mercury's transit of the sun.

Gassendi suffered a major loss when Peiresc died in 1637. Losing not only his patron but also a close and valued friend, he wrote little for the next four years. In 1641 he published a memorial to his friend, *Viri illustris Nicolai Fabricii de Peiresc Senatoris Aquisextiensis vita*. Having returned to Provence to perform his clerical duties, Gassendi was invited by Louis-Emmanuel de Valois, count of Alais, a man closely connected to the royal family, 'to wait upon' him, that is, to enter a client-patron relationship which continued until Valois' death in 1653.

Gassendi was deeply involved in the major developments in natural philosophy in his day. He published an exposition of Galileo's new science of motion, *De motu impresso a motore translato* (1642), which contains the first correct statement of the principle of inertia in print (see Galileo, G.). Prior to the publication of Descartes' *Meditations* in 1641, Mersenne invited Gassendi, among other philosophers and theologians, to comment on the manuscript of the work. These comments, first published as the fifth set of 'Objections', were enlarged in Gassendi's *Disquisitio metaphysica, seu dubitationes et instantiae adversus Renati Cartesii metaphysicam et responsa (Metaphysical disquisition, or doubts and instances against the metaphysics of René Descartes and responses)* (1644), which contains Gassendi's objections to the *Meditations*, Descartes' replies, and Gassendi's rejoinders (see Descartes, R.). He also published an account of the new astronomy in *Institutio astronomica juxta hypotheseis tam veteram quam Copernici et Tychonis Brahei* (1647).

In 1645, Gassendi received an appointment as professor of mathematics at the Collège Royal. In 1653, after Valois' death, Gassendi came under the protection of Henri-Louis Habert, lord of Montmor, a patron of natural philosophy, with whom he lived until his own death in 1655.

During the last decade of his life, Gassendi published the products of his extensive work on the life and philosophy of Epicurus. The three major Epicurean works include *De vita et moribus Epicuri libri octo* (1647), *Animadversiones in decimum librum Diogenis Laertii, qui est de vita, moribus, placitisque Epicuri (Observations on Book X of Diogenes Laertius, Which is about the Life, Morals, and Opinions of Epicurus)* (1649), and the *Syntagma Philosophicum*, published posthumously in 1658.

2 Gassendi's Epicurean project

The unifying theme of Gassendi's work was his project to restore the philosophy of Epicurus, making it acceptable to orthodox Christians. He envisaged this Christianized Epicureanism as a complete philosophy that would replace Aristotelianism, which had been dominant in the universities for centuries (see Aristotelianism in the 17th century; Epicurianism).

Gassendi's rejection of Aristotelianism is the theme of his 1624 *Exercitationes Paradoxicae Adversus Aristoteleos*. Drawing on the Pyrrhonian scepticism of Sextus Empiricus, Gassendi attacked the epistemological and metaphysical foundations of Aristotelianism (see Pyrronism). He rejected Aristotle's philosophy of matter and form, as well as his ideal of demonstrative certain knowledge as the epistemological goal of natural philosophy (see Aristotle). Rather than sinking into sceptical despair, however, Gassendi adopted what Popkin (1979) has happily called 'mitigated scepticism', advocating a science of appearances which can attain at best probable knowledge of things based on their appearances. He denied the possibility of knowing essences and explicitly allied himself with the nominalists (see Nominalism). An empiricist epistemology and a nominalist metaphysics were central themes in his philosophical writings. In this early work as well as in correspondence from the second half of the 1620s, he expressed a growing interest in Epicureanism as a substitute for Aristotelianism.

Although there is evidence that Gassendi was attracted to the philosophy of Epicurus from the mid-1620s, he did not defend Epicureanism in print until the 1640s. During the intervening years, his Epicurean project grew from the straightforward humanist task of translating Book X of Diogenes Laertius' *Lives of Eminent Philosophers*, one of the major sources for knowledge of Epicurus' writings, to a full-fledged rehabilitation of Epicureanism (see Diogenes Laertius). During the early 1630s, Gassendi produced a manuscript of his Epicurean commentary, which he shared chapter-by-chapter with Peiresc and some other friends. By 1634, he completed a draft of what would later be published as *De vita et moribus Epicuri* (1647). During 1641 and 1642, he wrote a series of letters containing a sketch of his Epicurean project to his patron, the new governor of Provence, Louis-Emmanuel de Valois. In *De vita et moribus Epicuri*, Gassendi defended Epicurus against the allegations of decadence and immorality that had dogged his reputation since antiquity. In 1649, he published *Animadversiones in decimum librum Diogenis Laertii*, a book still conceived in the humanist format as a commentary on an ancient text. The posthumous *Syntagma Philosophicum* (1658) was the culmination of Gassendi's Epicurean project, incorporating material from contemporary natural philosophy into an exposition of Epicureanism.

At every stage of his Epicurean project, Gassendi was concerned to modify certain of the ancient philosopher's doctrines in order to make his philosophy consistent with Christian orthodoxy. He rejected the theologically objectionable components of Epicureanism: polytheism, a corporeal conception of the divine nature, the negation of all providence, the denial of Creation *ex nihilo*, the infinitude and eternity of atoms and the universe, the plurality of worlds, the attribution of the cause of the world to chance, a materialistic cosmogony, the denial of all finality in biology, and the corporeality and mortality of the human soul. Gassendi replaced these doctrines with a Christianized atomism which asserted the creation of the world and its constituent atoms by a wise and all-powerful God who rules the world providentially, the existence of a large but finite number of atoms in a single world, the evidence of design throughout the Creation, a role for final causes in natural philosophy, and the immortality and immateriality of the human soul.

Gassendi's theology was thoroughly voluntarist. Voluntarism is an interpretation of God's relationship to the Creation which insists on God's omnipotence and his absolute freedom of will. Nothing exists independently of him, and nothing that he creates can bind or impede him. Emphasizing the contingency of the world on God's will, Gassendi believed that God's omnipotence is in no way constrained by the Creation, which contains no necessary relations that might limit God's power or will. 'There is nothing in the universe that God cannot destroy, nothing that he cannot produce, nothing that he cannot change, even into its opposite qualities' (1658 vol 1: 308). Consequently there are no universal or eternal essences of created things. Even the laws of nature lack necessity. 'He is free from the laws of nature, which he constituted by his own free will' (1658 vol 1: 381). The laws of nature have no existence apart from serving as descriptions of the regularities we observe in the operations of nature. In contrast to Descartes, Gassendi never identified any particular propositions as laws. Like everything else God created, he can negate them. He could have created an entirely different natural order if it had pleased him to do so. Similar to other voluntarists, for example Ockham, Gassendi believed that God's will was constrained only by the law of non-contradiction and that nothing God creates can prevent him from acting directly on the Creation. God does not directly produce all the motions of bodies, nor does he simply create bodies in the beginning, leaving them to act in accordance with their individual natures as bodies. He makes use of second causes - that is, natural causes that he has created. But he can always intervene and act directly if he wants. Nothing he creates constrains him in any way. 'God… is the most free; and he is not bound, as he can do whatever… he wishes' (1658 vol 1: 309). Nominalism was one important implication of Gassendi's voluntarism. The existence of universals, even universals created by God, would limit God's freedom of action. Gassendi's voluntarism and anti-essentialism played a central role in his debate with Descartes over the *Meditations*. These assumptions infused every part of his version of Epicureanism.

Gassendi employed humanist methods in philosophy. That is, he insisted on finding an ancient model for his philosophical views, and he wrote in a style marked by frequent allusions to and quotations from classical authors. Each section of his massive *Syntagma Philosophicum* begins with a summary of all existing views on the subject at hand. Only after having rehearsed all the traditional views did he embark on his own account of a subject. He articulated his own views in dialogue with his ancient model, Epicurus. In this respect, he was traditional, even though the content of his philosophy in many ways broke from traditional ideas. He claimed that he chose Epicurus as his model because his atomistic physics and hedonistic ethics could be more readily reconciled with

‘the Sacred Faith’ than any of the other ancient schools of philosophy. Presented as a complete philosophy to replace Aristotelianism, the *Syntagma Philosophicum* is divided into three large sections, entitled ‘Logic’, ‘Physics’, and ‘Ethics’.

3 Logic

The first part of the *Syntagma Philosophicum*, entitled ‘Logic’, is the culmination of Gassendi’s lifelong considerations of this subject. He proposed to substitute the canonic of Epicurus for Aristotelian dialectic which he judged to be useless for obtaining knowledge of nature. He considered logic to be the art of thinking well. He developed it as a theory of knowledge and a primitive psychology to explain how ideas get into the mind rather than simply a study of the forms of syllogism and the relationships among propositions, although he discussed these topics as well. He advocated an empirical approach to knowledge of the world, one modelled on the Epicurean canonic.

In his early *Exercitationes Paradoxicae Adversus Aristoteleos*, Gassendi attacked Aristotelian dialectic as overly complex and abstruse, useless as a method for making new discoveries. He used the classical sceptical arguments to question the reliability and validity of sensory experience. Since Aristotelian demonstration requires premises based on experience, Gassendi argued that the syllogisms involved cannot produce certain knowledge about the world. Moreover, since the conclusion of a syllogism contains no information not already present in the premises, syllogistic demonstration is incapable of producing new knowledge. Gassendi concluded that the entire method of Aristotelian demonstration is without foundation or utility. Not satisfied with the suspension of judgment advocated by the ancient sceptics, he opted for a middle way, ‘mitigated scepticism’. He based this approach on a series of rules or canons, which he drew from the Epicurean Canonic. These canons defined sensations, ideas, propositions and syllogisms. Gassendi then elaborated a criterion of truth, based on empiricist assumptions.

Adopting the fundamental empiricist doctrine that all ideas contained in the mind derive from the senses, Gassendi distinguished between two sorts of truth, what he called ‘truth of existence’ and ‘truth of judgment’. Truth of existence refers to the content of sensation itself. That it is what it is must be true. In this respect the senses are infallible. The sensation of gold is a sensation of gold, whether or not the object sensed is really gold or even exists. Truths of judgment, in contrast to truths of existence, are truths about the judgments we make about sensations. They are fallible, since they can assert statements about the world which might not be true. An example of such a judgment would be the proposition that this object is gold.

On the basis of this distinction, Gassendi argued that sensations, which are truths of existence that he called ‘appearances’, provide the basis for our knowledge of the world. This knowledge cannot penetrate to the inner natures of things precisely because it is knowledge of how they appear to us. On the basis of the appearances, however, it is possible to seek causal explanations, with the understanding that such reasoning is always conjectural and subject to revision in the face of further knowledge. This science of appearances can never achieve certainty, only probability, but such probability is adequate for our needs. In settling for probability rather than certainty as the epistemic goal of natural philosophy, Gassendi was rejecting the traditional Aristotelian and Scholastic conception of *scientia* or demonstrative knowledge. His redefinition of the goals of natural philosophy influenced the conceptions of later natural philosophers such as Robert Boyle John Locke and Isaac Newton.

4 Physics

The ‘Physics’ is by far the longest part of Gassendi’s *Syntagma Philosophicum*. Here he laid down the basic principles of his natural philosophy. He claimed that the fundamental components of the natural world are atoms and the void.

Gassendi began his account of the nature of things in general with a discussion of the void, since he thought that the entire universe is contained in empty space. In accordance with traditional discussions, Gassendi classified the void into three categories: the separate, extra-cosmic void; the interparticulate, interstitial, or disseminated void; and the *coacervatum*, produced by collecting a number of interstitial voids, usually by means of some kind of mechanical device. The question of the existence of void led him into a discussion of space and time more generally. Borrowing from the Renaissance Platonist Francesco Patrizi, Gassendi argued that space is neither substance nor accident but, rather, a kind of incorporeal extension. He thus avoided Aristotle’s error of

confounding dimensionality and corporeality. Space, according to Gassendi, continues to exist even when the matter contained in it moves away or ceases to exist.

The large extramundane void is the space in which God created the universe. It is boundless, incorporeal extension. Following Epicurus, Gassendi argued that the existence of interstitial void is a necessary condition for motion; for without void spaces, there would be no place into which particles of matter could move. Other Epicurean arguments included the saturation of water with salt, the dissemination of dyes through water, the penetration of air by light, heat and cold, all of which he assumed to be corpuscular. These phenomena seemed to require empty spaces between the particles composing material bodies. Gassendi also borrowed several arguments from Hero of Alexandria (*fl*. 62 AD), who had drawn an analogy between the matter composing bodies and a heap of grain or sand. Just as the individual grains are separated from each other by air or water, so the particles composing bodies are separated by small void spaces. The compressibility of air, which Hero had demonstrated by means of several inventions, including the pneumatic cannon and the aeolipile (a prototype of the steam engine), seemed to call for the existence of interstitial void between the material particles composing air.

Gassendi drew on contemporary natural philosophy to argue for the existence of the *coacervatum* void, especially the barometric experiments of Torricelli and Pascal. Gassendi accepted the mechanical explanation of the suspension of mercury in the barometer, as the result of atmospheric pressure, thereby rejecting the Aristotelian explanation which appealed to the paradigmatic occult quality, the *horror vacui*. He argued that the space in the tube above the mercury is void.

Gassendi's atoms are perfectly full, solid, hard, indivisible particles, so small that they fall below the threshold of sense. Following Lucretius, the Roman expositor of Epicureanism, Gassendi noted several commonly observed phenomena that lend support to the existence of such atoms. Wind is evidence that invisible matter can produce visible, physical effects. So is the fact that paving stones and ploughshares wear away because of constant rubbing, even though individual acts of rubbing produce no discernible change. The passage of odours through the air can be explained in terms of tiny particles travelling from the source of the odour to the nose.

Atoms possess only a few primary qualities: magnitude and figure, resistance or solidity, and heaviness. Gassendi appealed to observations using the new instrument, the microscope, to provide evidence for their small size. He also cited traditional observations such as the dispersion of pigment in water and the large quantity of smoke emanating from a smouldering log. He argued for the indivisibility of these atoms by appealing to Zeno's paradoxes, which he interpreted as implying the absurdity of the idea of the infinite divisibility of matter (see Zeno of Elea).

Matter, in the form of atoms, is the material principle in Gassendi's world. The efficient principle explains the causal structure of the world. The first cause is God, who created the world, including the atoms. Second causes, the natural causes operating in the physical world, are reduced to collisions among atoms moving in void space. In contrast to Epicurus who had claimed that an endless series of worlds is being produced by an eternal series of chance collisions among an infinite number of uncreated atoms, Gassendi argued that the world and its constituent atoms - a large, but finite number of them - had been created by God, who continues to rule the world providentially, with special providence for humankind. Rejecting the atomic swerves or *clinamen* that Epicurus had introduced to account for the collision of atoms that would otherwise only fall downward in parallel paths, Gassendi maintained that the motions of atoms had been caused by God at the beginning. Gassendi argued for God's providential relationship to the creation on the basis of an extended argument from design.

Having established the material and efficient principles of things, Gassendi proceeded to argue that all the qualities of bodies can be explained in terms of the motions and configurations of their constituent atoms. He gave mechanical, atomistic explanations of the whole range of qualities, including rarity and density, transparency and opacity, size and shape, smoothness and roughness, heaviness and lightness, fluidity and firmness, moistness and dryness, softness and hardness, flexibility and ductility, flavour and odour, sound, light, and colour. He concluded his account of qualities with a chapter on the so-called occult qualities, in which he argued that there is no action at a distance and that even apparently occult qualities such as magnetism and the sympathies and antipathies favoured by the Renaissance naturalists can be explained in mechanical terms.

In this first section of the 'Physics', Gassendi created the blueprint for his version of a mechanical philosophy of

nature, a Christianized version of Epicurean atomism, designed to replace Aristotle's *Physics* and consonant in spirit, if not detail, with that of his contemporary Descartes (see Descartes, R. §11). In the remaining sections of the 'Physics', Gassendi tried to explain all the phenomena of the world in these terms. His work paralleled Aristotle's treatises *De caelo*, *Meteorologica*, *De partibus animalium*, and *De anima*; but he took account of recent developments in natural philosophy. His intentions to mechanize notwithstanding, he wrote eclectically, often appealing to concepts and terms drawn from traditions such as Aristotelianism, Renaissance naturalism and even alchemy (see Alchemy).

Having considered the universal principles of physics, Gassendi proceeded to consider the created world, starting with celestial things. He discussed the following questions: the substance of the sky and stars; the variety, position, and magnitude of the stars; the motions of the stars; the light of the stars; comets and new stars; and the effects of the stars. In his youth, Gassendi had endorsed the new Copernican astronomy enthusiastically. The condemnation of Galileo in 1633 dampened his enthusiasm, at least in print, where he expressed sceptical doubts about being able to prove any of the three main world systems - Ptolemaic, Copernican, and Tychonic - conclusively. In the *Syntagma Philosophicum*, he proposed the system of Tycho Brahe as a compromise approved by the Church, but not before having stated that the Copernican theory was 'more probable and evident'.

As for the effects of the stars, Gassendi thought astrology 'inane and futile.' He rejected the possibility that the stars cause terrestrial and human events. Sidereal and planetary configurations may be signs of some events on earth, such as the seasons or the weather, but they are not their causes. Moreover, the ability to prognosticate the future is the prerogative of God alone. Gassendi found horoscopes based on the moment of nativity ridiculous. Why, he asked, should the heavenly bodies have more influence at the moment of birth than at any other moment in a person's life? He thought that the principles of astrology were based on insufficient evidence, and that astrologers often resort to deception.

Having discussed the heavens, Gassendi turned his attention to terrestrial phenomena, considering inanimate things first. He described the properties of Earth, the distribution of water and land, the tides, subterranean heat and the saltiness of the sea. He then turned to 'meteorological' phenomena, which included winds, rain, snow, ice, lightning and thunder, rainbows and parhelia, and the Aurora Borealis. Shifting his attention to smaller things, he wrote about stones and metals, paying particular attention to recent observations of the magnet and to the question of the transmutation of gold,which he considered possible. Finally, among inanimate things, he discussed plants which, he claimed, Epicurus had believed to be inanimate, that is, lacking soul. Gassendi discussed the varieties of plants and their parts, considering their various physiological processes, including grafting, nutrition, germination, growth, and death.

The final section of the 'Physics' was devoted to terrestrial living things, or animals. This section contains discussions of the varieties of animals, the parts of animals - which he described in explicitly finalistic terms, and various physiological topics including generation, nutrition, respiration and motion. Gassendi devoted about half of this lengthy section to the topics of sensation, perception and the immortality of the human soul.

Gassendi's argument for the immortality of the soul was a key factor in his Christianization of Epicureanism. Epicurus, in order to eliminate fear of death and anxiety about punishment and reward in the afterlife as major sources of human distress, claimed that the soul is material and mortal (see Epicurianism §13). In addressing the nature of the soul, Gassendi said that the soul is what distinguishes living things from inanimate things. Adopting the distinction between *anima* and *animus* directly from Lucretius, Gassendi argued that the *anima* or sentient soul is material and present throughout the body but that the *animus* or rational soul is incorporeal. Like animals, humans possess an *anima*, but the possession of an *animus* distinguishes them from animals.

The *anima* was thought to be composed of very fine and intensely active atoms, 'like the flower of matter'. It is the principle of organization and activity for the organism and the source of the animal's vital heat. It is also responsible for perception, forming the imagination or 'phantasy', a physical organ which forms images derived from perception. The *anima* is transmitted from one generation to the next at the moment of conception.

The *animus* or rational soul is an incorporeal substance, created by God, infused in the body and functioning like an informing form. Gassendi argued on several traditional grounds for the incorporeality of the rational soul. We know that it is distinct from the corporeal imagination or phantasy, because we can understand some things of

which we cannot form images, for example, that the sun is 160 times larger than the earth. Moreover, unlike corporeal things, the rational soul is capable of reflecting on itself. It is also able to reflect on the nature of universality *per se*, whereas animals, possessing only the corporeal *anima*, are limited to forming universal concepts without having the ability to reflect on them abstractly. Gassendi's claim that the rational soul, in contrast with the animal soul, is incorporeal established one of the boundaries of his mechanization of the world.

Having established the immateriality of the rational soul, Gassendi proceeded to argue for its immortality. He wrote of this topic as the 'crown of the treatise' and the 'last touch of universal physics'. Although he knew of the soul's immortality on the basis of 'the Sacred Faith', he supported this article of faith using philosophical and physical arguments, his response to the Fifth Lateran Council's call on philosophers in 1513 'to use all their powers, including natural reason, to defend the immortality of the soul'. Epistemologically similar to all reasoning in natural philosophy, the conclusions drawn from physics and philosophy could at best be highly probable. Nevertheless Gassendi was certain of the soul's immortality which was ultimately grounded in faith.

Gassendi argued on the basis of physics that the soul is immortal because it is immaterial. Lacking matter, an immaterial thing 'also lacks mass and parts into which it can be divided and analyzed.' This argument was similar to arguments used by Kenelm Digby, Henry More and others. Another approach, which he called 'moral', argued for immortality on the grounds that the afterlife is necessary in order to compensate for various injustices in this life. Gassendi went on to argue against many detractors of the soul's immortality, especially Epicurus against whose arguments he devoted an entire chapter of the *Syntagma Philosophicum*.

Gassendi's argument that the rational soul is immaterial and immortal provides evidence that he was not a materialist, despite arguments to the contrary by some scholars, notably O.R. Bloch. Bloch (1971) bases his claim that Gassendi defended the immateriality of the rational soul only in deference to the Church on two claims: that Gassendi ascribed many aspects of cognition to the material *anima*; and that he did not fully articulate his arguments for an immaterial *animus* until 1642. Bloch's interpretation of Gassendi as a clandestine materialist belies the fact that Gassendi's assertion of the existence of God, angels, demons and an immaterial immortal soul is to be found throughout his Epicurean writings. These topics appear as early as a manuscript outline of his Epicurean project which he sent to Peiresc in 1631 at the inception of his project, in his letters to Valois in the 1640s, and in the posthumous *Syntagma Philosophicum*.

Gassendi's Christianized Epicureanism had significant influence on natural philosophy in the latter half of the seventeenth century. Brought to England in Walter Charleton's translation in the 1650s, Gassendi's ideas influenced the thinking of Robert Boyle and Isaac Newton. His epistemology was also important for the thought of John Locke.

5 Ethics and political philosophy

The 'Ethics' comprises the third and final part of the *Syntagma Philosophicum*. Here, Gassendi fulfilled his youthful determination to Christianize all parts of Epicureanism. Epicurean ethics was founded on the principle that pleasure is the end of life (see Hedonism). Pleasure, according to Epicurus, consists of freedom from bodily pain and freedom from mental turmoil. The greatest pleasure is associated with the absence of both anxiety and physical pain, a state of tranquillity. The achievement of tranquillity gives individuals self-sufficiency, so that they are free to pursue their own pleasures. Epicurus recognized that not all pleasures are of equal value, and gave reason the role of calculating pleasure and pain. In this way, he could claim that long-term pleasure was of greater value than short-term pleasure that might lead to long-term pain. The freedom humans need to implement the calculus of pleasure and pain was insured by the random swerve of atoms, the *clinamen*, which added a dimension of indeterminism to the human soul which Epicurus believed to be composed of atoms. Epicurean hedonism did not receive a good press, either in antiquity or in the Christian Middle Ages. Dogged by Epicurus' reputation for atheism and moral decadence, this philosophy needed to be restored and Christianized in order to be acceptable to orthodox intellectuals in the seventeenth century. Gassendi addressed this task in the 'Ethics'.

Although Gassendi accepted the Epicurean principle that equated pleasure with the good, he reinterpreted the concepts of pleasure and human action, thereby creating a Christian hedonism which found a natural place in his providential worldview. Gassendi described four kinds of pleasure: the instinctive desire for pleasure that even irrational creatures possess; the calculated strategy of maximizing physical pleasure; the prudence of the wise who

understand that true pleasure consists of tranquillity and the absence of pain; and finally the sublime pleasure of the beatific vision of God. The prudence of the wise is based on understanding the vanity of most human desires. The wise person will employ the calculus of pleasure and pain to achieve the state of tranquillity. Gassendi united this hedonistic ethics with his providential worldview by claiming that God has instilled in humans a natural desire for pleasure and a natural aversion to pain. In this way, God guides human choices, without negating free will. The prudent pursuit of pleasure will ultimately lead to the greatest pleasure of all, presence with God in heaven.

Consistent with the voluntarist theology that informed all of Gassendi's philosophy, the 'Ethics' presumed both divine and human freedom. Human freedom is a necessary concomitant of voluntarism, for if human actions are inexorably determined, that determinism will limit God's freedom to intervene in their lives. Gassendi considered true freedom, *libertas*, to be the freedom of indifference, the ability of the mind to make judgments and take action without being determined in one direction or another. This kind of freedom gives reason a central role in moral deliberation. Gassendi contrasted *libertas* with *libentia* - spontaneity or willingness - which is characteristic of boys, brutes and stones, creatures that are impelled to move in certain ways, but not on the basis of judgments deriving from the freedom of indifference.

Gassendi's emphasis on freedom, both human and divine, led him to consider the question of predestination, which was the main context for discussions of freedom and determinism in the post-Reformation setting. How can human action be free if God has foreknowledge of who will be saved and who will be damned? Influenced by the Jesuit Luis de Molina's moderate stance on the question of predestination (see Molina, L. de; Predestination), Gassendi argued that God created people free to choose, even though he knows from his eternal viewpoint how they will choose. Gassendi, following Molina, claimed that divine foreknowledge does not interfere with human freedom. Similar concerns with free will led Gassendi to reject both Stoic fatalism and astrology.

Gassendi's hedonism led him to formulate a political philosophy based on the idea of *pactum* or contract (see Contractarianism). Starting from the idea of a hypothetical state of nature in which there was no secure ownership of property, a state which would inevitably degenerate into turmoil and conflict, Gassendi argued that individuals could secure greater happiness for themselves by forming societies. These societies are based on pacts or contracts in which both individual rights and property rights are defined and in which the weaker are protected from the stronger. The contracts establish rights, which Gassendi considered natural in the sense that they follow from the calculus of pleasure and pain. Civil society is thus a natural outcome of human nature. A system of justice comes into being to restore rights that have been violated and to prevent further violations. Gassendi favoured monarchy as simpler and more efficient than the other traditional forms of government. However, he argued that the power of the monarch remains answerable to the consent of the governed who first established the contract. He was therefore opposed to absolutism on the grounds that the absolute monarch had severed his relationship with the governed and was consequently answerable to no one. Gassendi developed his political philosophy in close contact with Thomas Hobbes, and his ideas had a profound influence on John Locke, who is usually named as the founder of the liberal tradition in political philosophy (see Liberalism).

Gauḍīya Vaiṣṇavism

The philosophical school encompassing the Bengali devotees of the god Viṣṇu is traditionally known as the Gauḍīya Vaiṣṇava school. Caitanya is considered to be the founder of this school in the sense that he led a revival of Kṛṣṇa devotionalism in Bengal during the early sixteenth century, inspiring a number of contemporary intellectuals to some original speculations of a metaphysical nature. Some of these were directly related to Vedānta, others were not. Since the eighteenth century the school has also become associated through Baladeva Vidyābhūṣaṇa with the Madhva school. However, the latter propounded a dualistic doctrine, while the Gauḍīyas are believers in the inconceivable simultaneous difference and oneness of the Supreme and his creation.

1 Kṛṣṇa Caitanya (1486-1534)

Born in Nabadwip, Bengal as Viśvambhara Miśra, Caitanya was first a precocious student and then worked as a teacher of Sanskrit grammar until becoming possessed by unusually strong devotional impulses at the age of twenty-three. He took the name Kṛṣṇa Caitanya when taking monastic vows in 1510. Despite entering a Śaōkarite order, Caitanya had a deep-rooted distaste for the conclusions of exclusive nondualism (see Śaōkara). He thus reversed Śaōkara's interpretation of the essential statements of the Vedānta, taking 'Thou art that' (*tat tvam asi*) as 'Thou art his (servant)'. After his renunciation, Caitanya travelled throughout India before retiring to Puri in Orissa where he remained fully absorbed in devotional acts until his death. Caitanya's influence was born primarily of his charisma and he himself wrote nothing more than a few devotional verses (*Śikṣāṣṭaka* (Eight verses of instruction)) which encapsulate his doctrine: by singing the names of God one can be liberated from material suffering and reunite with him.

2 The Gosvāmins of Vṛndān

The brothers Sanātana (d. 1556) and Rūpa Gosvāmin (d. 1566) and their nephew Jīva Gosvāmin (d. 1612) are considered to be the foremost thinkers of the school. Sanātana's commentary on the tenth book of the *Bhāgavatapurāṇa* and his *Bhāgavatamṛta* (Essence of the *Bhāgavata*) are primarily concerned with the descriptions of the avatar Kṛṣṇa and the distinctions made between the various personal manifestations of Viṣṇu (or Kṛṣṇa) and giving them a hierarchical classification. This same preoccupation is found in all the Gauḍīya writers. Rūpa Gosvāmin is notable for his utilization of the theories of Sanskrit poeticians, the writers on literature and rhetoric, in particular that of aesthetic experience (*rasa*). Viśvanātha Kavirāja (fourteenth century) had identified aesthetic experience as *brahma-sahodara*, the 'twin of spiritual experience' and Rūpa adapted the current taxonomy of *rasa* as given in Siōgabhūpāla's *Rasasudhākara* to the *līlā* of Rādhā and Kṛṣṇa. His justification for such a jump was as follows: of the three features of the Supreme, existence (*sat*), consciousness (*cit*) and joy (*ānanda*), joy is the highest. It is to realize this joy that the Supreme creates, as joy cannot exist in a nonmanifold state. The highest truth is thus revealed in emotional experience which is reflected in our personal human relations. Just as these experiences are distilled and experienced transcendentally in works of drama or poetry, so too is an even higher transcendental emotional relation experienced with the Supreme. Just as sexual love is the most intense and dominating of the varieties of human relationships, its spiritual counterpart is also the preeminent amongst those experienced with God. Because this relationship is found in its most relishable form exclusively in God's manifestation as Kṛṣṇa, Kṛṣṇa is the highest form of God. The monistic view of God, in which personal relationships are denied, is considered a partial and defective view of the Supreme. Its monotheistic counterpart - the concept of God as possessing only certain attributes of omniscience and omnipresence - is conducive to the mood of devotion known as the 'peaceful' (*śānta*) which is also considered to be inferior to the filial and servile (*dāsya*), the friendly (*sākhya*) or protective (*vātsalya*) moods.

Jīva attacked more basic questions of doctrine in his *Bhāgavatasandarbha* (Treatise on the *Bhāgavata*), a systematic treatment of the theology of the *Bhāgavatapurāṇa*. As with the other Vedāntists, Jīva accepts the three sources of knowledge (*pramāṇas*): direct perception, logical reason and revelation (see Knowledge, Indian views of). However, Jīva considers the *Bhāgavata* to be the most perfect source of revelation which gives the clearest explanation of the *Vedāntasūtras*. Many of his key concepts are derived from the *Viṣṇupurāṇa* and a great deal of his thought concurs with that of Rāmānuja. For Jīva the problem of unity and difference is resolved through the concept of *śakti* (power): all creation is a product of God's power or energy which is innate in him. God's energies

form a unity with him just as the heat, light and sparks of a fire form a unity with the fire. God's energies are divided into three categories: internal, external and marginal. The temporal creation is external to God, comparable to a shadow which, although devoid of light depends on light for its existence and is unconscious. The internal energy is the world of God's grace; it has three aspects according to the Vedāntic categories of eternity, consciousness and bliss. The marginal energy (*taṭasthaśakti*) is the living being, a spark of consciousness who is conditioned by association with matter. The conditioned soul possesses limited freedom to choose between the internal and external energies. This ability to choose is awakened by association with God's devotees who give him a taste of the joy of the perfections available in the internal realm. Through such association, an individual becomes aware that relations in the conditioned existence are partial and unsatisfying and he learns to seek the essential relationship that he possesses with the root of all existence, the Supreme soul. Through the purifying process of devotion in practice (*sādhanābhakti*), the specific character of this emotional relationship is awakened in him. Love of God (*premabhakti*) is the ultimate goal of perfection.

3 Later Gauḍīya Vaiṣṇavas

Prominent later members of the school include Viśvanātha Cakravartī (seventeenth century) and Baladeva Vidyābhūṣaṇa (early eighteenth century). Baladeva's main contribution is his commentary on the *Vedāntasūtra*, the *Govindabhāṣya*, in which he arranges the ideas of his predecessors according to the sūtras. He also introduced certain elements of Madhvācārya's thought into the tradition, despite the fact that Madhvācārya (fourteenth century) propounded a dualist (*dvaita*) doctrine, while the Gauḍīyas style themselves as believers in the inconceivable simultaneous difference and oneness of the Supreme and his creation (*acintyabhedābhedavādins*).

Gautama, Akṣapāda

‘Akṣapāda Gautama’ (or ‘Gotama’) stands for the legendary founder of the Nyāya (‘Logic’) school of Indian philosophy, who is reputed also to be the author of its basic text, the Nyāyasūtra. This compilation of roughly 500 mnemonic sentences reached its first defined form around AD 400. Its oldest core preserves a manual of philosophical debate supplemented by elements of an early philosophy of nature and a basic soteriology. The later parts of the text deal with the number and nature of the means of valid cognition; they further treat the objects of valid cognition and discuss basic questions of metaphysical content.

Pakṣilasvāmin Vātsyāyana (*circa* second half of the fifth century AD), the author of the first preserved commentary on the *Nyāyasūtra*, refers to the founder of Nyāya as the sage Akṣapāda. This name, meaning ‘the one with eyes on his feet’, appears repeatedly in the school’s older tradition. Later anecdotes current among Indian pandits connect it with the sage’s deep philosophical contemplation and the superiority of Nyāya over its critics from the more orthodox camp, who held the Vedic revelation to be the most authoritative means of valid cognition. From the tenth century onward, the personal name Gotama or clan name Gautama (‘descendant of Gotama’) is connected with the school’s basic teachings; both names become more current in the eleventh and following centuries, often appearing next to the older ‘Akṣapāda’. The identity of this Akṣapāda Gautama/Gotama - if there ever was a historical personage of that name - remains a matter of speculation, as does his possible role in the formation of the Nyāya school and its basic text.

The *Nyāyasūtra*, divided into five chapters, reflects in its textual history the origin and early development of Nyāya itself. The ancient core of the text is preserved in chapters one and five, and could stem in this or a similar form from the second century AD. It is actually a manual of debate (*vāda*) which enumerates and concisely defines sixteen categories (*padārtha*) relevant to the orderly and successful conduct of a public philosophical debate. These are: (1) means of valid cognition, (2) objects of valid cognition, (3) doubt, (4) purpose, (5) generally accepted fact, (6) tenets, (7) members of proof, (8) reasoning, (9) decision, (10) friendly debate, (11) wrangle, (12) dispute involving mere criticism by one party, (13) fallacious reasons, (14) distortions, (15) sophistries and (16) points of defeat. An early philosophy of nature and a rudimentary soteriology were integrated into the category of objects of valid cognition (*prameya*); these are: (1) self, (2) senses, (3) body, (4) sense objects, (5) cognition, (6) ‘internal instrument’, (7) linguistic, mental and physical activity, (8) emotional and intellectual faults that instigate activity, (9) rebirth, (10) the result of activity and faults - that is, the experience of pleasure and pain, (11) suffering and (12) release. The text’s initial sentence proclaims that adequate knowledge of all sixteen categories effects the attainment of the highest good - namely, release from suffering, or liberation. In the Indian context, the school’s teachings could not be presented as a complete philosophical doctrine without this soteriological component.

Owing to its origin in a tradition concerned with methodical and sound argumentation, logical and epistemological issues are prominent in Nyāya from early on. In chapter two of the *Nyāyasūtra*, the very possibility of means of valid cognition (*pramāṇa*) is defended against attacks by an opponent who professes a functional essentialism; related attacks are also found in works ascribed to Nāgārjuna (§2). Subsequently, the four means of valid cognition accepted in Nyāya are examined in detail and established as distinct; these are sensory perception, inference, analogy or comparison, and verbal testimony (see Knowledge, Indian views of). Further means accepted by other schools, such as traditional lore, circumstantial evidence or presumption, coincidence or inclusion, and absence or negation, are shown to be included in verbal testimony and inference. The examination of sensory perception entails an exposition and defence of the doctrine of the whole as distinct from its parts (contested by Buddhist opponents), which is taken up again in chapter four and expanded with a defence of the atom as the ultimate partless constituent of matter (see Matter, Indian conceptions of §2; Sense perception, Indian views of §§4-5). In this context, the realistic outlook of Nyāya, as opposed to Buddhist idealism, is maintained. The topic of verbal testimony, instruction by a trustworthy person which may have visible or invisible objects, occasions a defence of the authority of the Veda. This places Nyāya within the larger Brahmanical tradition, although it differs from the orthodox Mīmāṃsā school in assuming a personal authorship of these texts and denying their eternity (see Mīmāṃsā §2). A digression on the impermanence of articulated sound and a refutation of its eternity underscores the difference between their philosophies of language, as does the concluding section on the referent of the word.

Like chapter two, chapters three and four proceed in a dialogical-dialectical manner, treating mainly the objects of valid cognition. The existence of a self or soul (*ātman*) is proved by various arguments; arguments based on innate dispositions imply its previous existence in other bodies. Cognition, which is momentary, is shown to be a quality of the soul, not of the body or of the 'internal instrument' called the *manas* (often misleadingly rendered as 'mind'); the *manas* functions in non-sensory cognitive events, such as recollection, and regulates cognitions in general. The senses are argued to be material, of the nature of the five elements earth, water, fire, wind and 'ether', whose specific qualities they grasp - these are smell, taste, colour, temperature and sound respectively. Sight receives special treatment as consisting in fiery rays issuing from the eyes to make contact with objects. Finally, several sections address soteriological issues, the possibility of release and the knowledge eventually leading to it. This knowledge chiefly concerns the true nature of the sense objects and can be attained by meditative contemplation and yogic practices aided by self-restraint. Friendly debate with disciples, teachers, fellow students and others striving for salvation serves the same purpose. Disputations with opponents protect one's nascent ascertainment of the truth.

Gender and science

Gender-based analyses of philosophies of science have arisen at the conjunction of two other movements. First, in the 1960s it became increasingly the accepted position that scientific claims failed to reflect only an external reality. Scientific processes are not transparent; they necessarily permit cultural and social values and interests to contribute to the descriptions and explanations of nature's order. Thus gender values and interests, too, could have shaped scientific practices and claims. Second, women's movements developed powerful gender analyses of all other aspects of social relations. What resources could such accounts provide to illuminate also the practices and cultures of the sciences?

Consequently, diverse analyses have appeared showing how sexist and androcentric values and interests have shaped scientific projects, and shaped them with unfortunate results not only for gender relations, but also for the advance of both sciences and philosophy. They also examine how other values and interests, ones that are gender-neutral and ones that draw on resources found in women's lives, can have beneficial effects. Concern has been raised in the following issues. Is correcting 'bad science' sufficient to eliminate sexist and androcentric results of research? How has the exclusion of women from those groups that select what will count as scientific problems resulted in narrow and distorted representations of nature's order? How has excessive reliance on gendered meanings of nature, the scientist, and scientific method - gender coding - shaped scientific claims? If the subject of science remains coded masculine, how can women claim positions as speakers/authors of scientific research - as scientific subjects? In what ways have research procedures (technologies) been gender-coded and how has their use directed the development of subsequent sexist and androcentric technologies and applications of science? Why have standards for maximizing objectivity and good method been too weak to prevent of knowledge-decreasing values and interests from shaping the results of research?

1 Origins and scope

By the late 1960s, the Enlightenment vision of science had been undermined by views that observations are theory-laden, our beliefs form a network such that none are in principle immune from revision, and our best theories are underdetermined by any possible collection of evidence (see Observation §§3-4; Underdetermination). Thus empirical evidence could no longer be regarded as foundational. Slack in the procedures of the scientific system of belief-sorting permits the play of local values and interests across the entire fabric of scientific practices and claims - values and interests that can advance as well as retard the growth of knowledge. Moreover, there are no longer good grounds for assuming the unity of science, since neither physics' formally expressed laws of nature, nor the logic supposed to ground them, can be regarded as foundational in the sense of being assumed to have escaped the play of values and interests (see Unity of science). Sciences are embedded in their surrounding cultures - or, as the point was later made, co-constituted with them.

These findings made it difficult to reserve a subject matter for the philosophy of science that was safe from the legitimate gaze of historians and, later, sociologists, anthropologists, political theorists and even literary critics. After all, what is the point of philosophies of science that cannot account for the successes of science? In this first stage of post-Enlightenment philosophy of science, feminists raised issues about how gender relations, too, had shaped the sciences and their philosophies.

A second stage focused on one or another specific science, since it was thought that science in general had turned out to be too complicated to permit any comprehensive philosophical claims. Participation in this stage included Evelyn Fox Keller's works on, and in, physics and biology and Helen Longino, Elisabeth Lloyd and others in, and on, biology. Ethnographies of scientific practices and culture meanwhile were produced by historians, sociologists and anthropologists (for example, Donna Haraway's on twentieth-century primatology (1989) and Sharon Traweek's on contemporary physics (1988)). Feminist political theorists' questions about philosophical issues in the social sciences were understood often to be relevant also to the natural sciences. By the late 1980s, a third stage had produced a revival of more general philosophic concerns. These analyses have been able to draw on both earlier stages, and on the resources of literary and other cultural analyses of representation, narrative, discourse and rhetoric.

Feminism does not introduce gender into science or the philosophy of science, for it is already there. Instead,

feminism introduces gender as an analytic category (parallel to economic or Christian categories) into the philosophy and social studies of science discourses. As Keller puts the point, feminism tries to locate the scientific subject in *his* (masculine) practices and *his* rhetoric of neutrality that deny *his* very existence (Fox Keller 1983: 16-). Determining where this occurs is an empirical project. Moreover, in these accounts, gender is understood as socially constructed, not as determined by sex differences. As such, gender is not only a property of individuals but, far more importantly, of institutions and of symbolic systems. Thus science and the military are more masculine than are nursing or social welfare in their gendered divisions of activities and social meanings.

Feminist science studies were initially focused on six distinct areas. One, where have women been located in sciences' institutions, and what have been the obstacles to their entrance, retention and advancement? What are the particular consequences for the content of knowledge in each scientific field of the exclusion or restriction of women? Two, in what ways are scientific applications and technologies sexist or androcentric? Are these only 'misuses and abuses', or are blueprints for them provided by research methods themselves? Three, where are there sexist or androcentric silences and distortions in the results of research in biology and the social sciences? How do these biases reflect back on 'logics' of research and explanation for the natural sciences? Four, how do gendered models and meanings of nature, the scientist and the research process distort scientific representations of nature and social relations? Five, how are central epistemological regulatory notions - objectivity, good method, rationality, the abstract individual knower - conceptualized to favour the values and interests of the dominant groups? And six, what is the role of science education in exacerbating these problems?

Feminist work in other disciplines has been self-transforming. Women of colour in the West, working-class women, third-world women, sexual minorities and others marginalized by the dominant discourses have all challenged the centring of concerns and perspectives characteristic primarily of privileged women in the West. Thinking from the margins has become a crucial theoretical and empirical strategy for many 'centre' women, too. This work has only begun for the philosophy and social studies of science. Nevertheless, outlines for such projects have already been sketched out in the work of a few thinkers such as Harawayand Harding, and Shiva (1989) (see Postcolonial philosophy of science). The serious attention to issues of self-reflexivity characteristic of feminist work more generally provides stimulus and resources for the philosophy and the social studies of science also.

Finally, feminist philosophies of science draw on diverse disciplinary and theoretical resources. There is not now, nor will there ever be, a single feminist philosophy of science. Philosophical issues have been raised within the conceptual frameworks of the special sciences studied, disciplinary and theoretical frameworks of the social studies of science, and diverse political philosophies (see Feminism and social science; Feminist political philosophy). This entry will focus on five issues that surface repeatedly in these diverse approaches.

2 Bad science or standard science?

Are sexist and androcentric silences and distortions in the results of research in biology and the social sciences the consequence merely of bad science or, worse, also of standard science? The line between the empiricists and the post-empiricists, as we can refer to those who prefer one or the other of these positions, is not always hard and fast. Nevertheless, it is useful to characterize in such a way the two poles of the continuum on which feminists think about this question. Those who are satisfied with the first choice believe that there is nothing wrong with existing principles of good research in each disciplinary area, or with an empiricist logic of explanation. The problem is that researchers have not carefully or thoughtfully enough followed them. Basing generalizations about humans only on data about men, assuming that women's biology normally functions in immature or pathological ways, or that only males have evolved - such claims are examples only of bad science. Philosophers in this group often go on to criticize conventional assumptions that knowers are abstract individuals and to stress the importance of accountability to an epistemic community. Whatever their concerns, this group is marked by its vigorous intention to keep its projects firmly located within the empiricist tradition. For them, feminism raises new issues that enlarge the scope of research and reveal cause for greater care in its conduct and philosophic formulations, but leaves fundamentally unchallenged an empiricist logic of research and explanation.

A diverse group think gender problems in the natural sciences cannot adequately be understood or resolved by empiricist approaches: standpoint theorists such as Hilary Rose (1983), Dorothy Smith (1987) and Nancy Hartsock, standpoint theorists who also draw on post-structuralist resources; Donna Haraway (1991) and Sandra Harding (1986), and others like Evelyn Fox Keller who do not give their distinctive analyses a special name.

These feminist post-empiricists differ among themselves on the whole range of issues that divide the rest of post-empiricists; philosophically some feminist post-empiricists are more conservative and others more radical. All share the suspicion that there is something wrong with the standard ‘logics’ of both research and explanation. Androcentric values and interests are not just contingently present in the results of research; they also play a role in the cognitive, technical core of science that, in the Enlightenment vision, was held to be immune to all social fingerprints. If such values and interests can permeate the cognitive core of science - its ’method’ and collection of formal claims - then it is not sufficient simply to more carefully follow existing methods, theories and norms of science; instead these features must be transformed if the results of research are to escape distortion. Nor are remedies that rely on the critical effectiveness of a community of experts - an epistemic or scientific community - sufficient, since it is precisely such communities that have been unable to detect their own shared androcentric assumptions. There are problems with standard science that post-empiricists think require more radical kinds of resolution (see Scientific method §§2-3).

3 Whose problems?

Androcentric biases enter sciences at every stage of the research process, including the selection of problems. Just which array of problems scientists will pursue at any moment is far less due to scientists’ individual choices to ’pursue the truth wherever it may lead’ than it is to priorities of their sponsors and culture. However, the prevailing view has been that the selection of problems has no effect on the cognitive, technical core of science, that there is no logic of discovery, and thus that any attempt to regulate science prior to the context of justification is not only futile, but an infringement on sciences’ creative potential (see Discovery, logic of).

There is something odd about this protection of problem selection from responsibility for distortion in the results of research. The post-Kuhnian histories and ethnographies of science have revealed in great detail exactly how cultural assumptions and politically interested decisions made prior to the context of justification, the ones that constitute scientific projects and select methods to test hypotheses, preclude the possibility of the results of this research achieving cultural neutrality. If the problem is conceptualized as how to identify the proximate biological causes of cancer, one can be sure of a very different picture of nature and social relations in the results of that research than if the problem were conceptualized as how to identify the environmental carcinogens that are known to be the most powerful of the many causes of cancer. Focusing on proximate causes supports the interests and values of medical researchers, the tobacco, junk food and meat industries, and industrial and military polluters; focusing on environmental causes supports the interests and values of their critics and environmental researchers. Neither approach can be interest-free.

Feminists have argued that our collective knowledge about the natural and social worlds disproportionately represents the kinds of question of interest to the dominant social institutions - those interested in increasing profit, maximizing social control, legitimating hierarchical authority and the *status quo* and thereby advancing the values and interests of men in the advantaged groups, frequently at the expense of the values and interests of the poor, women, racial and ethnic minorities, and ‘have nots’ in other parts of the world. The patterns and contents of what sciences tend to discover about nature’s order disproportionately reflect what the dominant groups both have and have not wanted to know.

Faced with this problem, all feminists have recommended that scientific communities become more inclusive for scientific reasons as well as ones of social justice. Since the victims tend to be more sensitive to less obvious expressions of discrimination and devaluing of their concerns, their presence and critical analyses would be likely to improve the ability of the sciences to arrive at less partial and distorted representations of nature. However, such strategies are of dubious effectiveness by themselves; the concerns of marginalized people tend to remain marginalized when individuals from such groups are simply inserted into dominant and often resisting institutions that make no other changes.

Some feminists have proposed an additional strategy that could systematically help eliminate distortions in sciences’ representations of nature that are produced by androcentrism, Eurocentrism, or other values and interests that are shared by research communities (and, often, their cultures). They propose a strategy of conceptualizing scientific projects in the first place from outside the conceptual frameworks of dominant social institutions and research disciplines, namely from the standpoint of the lives of those who bear a disproportionate share of the costs

of how such institutions and disciplines function. Standpoint epistemologies thus direct researchers to start research from women's lives ('lives' plural, since 'women' is as heterogeneous a category as is 'humans') to generate scientific problems that are ones for women too, rather than only problems for the dominant institutions and the disciplines that work up knowledge for them. This 'method' is a collective and political process - a social and scientific achievement rather than an automatic outcome of women's experience or of living a woman's life. In a sense, they are proposing a kind of logic of discovery for more accurate, because interest-balanced, representations of nature and social relations.

4 Gender coding

What should one make of gendered metaphors and models of nature, the scientist and the research process that have been prevalent throughout the history of modern science? Historians and philosophers have pointed to the 'nature, she; scientist, he' language so familiar from Bacon and Machiavelli's writings to those of contemporary science texts. Susan Bordo (1987) Evelyn Fox Keller (1984) and Carolyn Merchant (1980) show how invoking images of the hyper-masculinity of science provided solace for the loss of the organicist 'mother-world' in early modern science. Such metaphors and models have helped to constitute the cognitive content of scientific claims, they and others argue.

The interactionist theory of metaphors and models holds that such forms of socially-meaningful language and concepts are a necessary part of every scientific theory. 'Nature is a machine' is not only heuristically or pedagogically useful; it also tells scientists how to develop their theories into new domains and where to revise when observations prove recalcitrant. As machines become more familiar, more natural, so too nature is experienced as more mechanical. And as the metaphor becomes more familiar, its regulatory functions shift from explicit plans into tacit knowledge. Similarly, conceptualizing nature as a wild and unruly woman who must be tamed if man is to be able to control his fate, as did Machiavelli, simultaneously directs scientists to favour certain kinds of interaction with nature and naturalizes certain ways of treating women. Enlightenment sciences have been directed by the illusion that there is a 'bare nature' at which scientists can gaze if they strip away the veils under which she hides her true features. But this metaphor distorts our understanding of how nature-as-an-object-of-knowledge is always already socially constructed, and yet also not agreeable to just any old fears, fantasies or desires that cultures choose to project on to its order. Humans speak in diverse metaphors, models and conceptual frameworks, but nature does answer back with as much (and only as much) precision as human interactions with it demand.

Such gender coding appears in ancient dichotomizing practices evident from Parmenides to the present day that construct self-other schemas coded masculine-feminine: rational-irrational, logic-emotions/passions, culture-nature, dynamic-static, mind-body, adult-infant, abstract-concrete, autonomous-dependent/relational/contextual, and so forth. Reliance on these symbolic systems can lead to oppressive social relations and distorted understandings of nature's order. After all, the dichotomies are empirically false of men and women's natures. Our understanding of nature can benefit from a broader array of metaphors and scientific processes than containment within such androcentric metaphors permits.

A persistent feminist concern has been with the modern coding of neutrality as masculine. If maximizing objectivity and rationality are conceptualized as requiring neutrality, and masculinity is defined partially in terms of its neutrality (even to gender, since 'man' and 'he' are taken to represent the generically human), then it is a kind of contradiction in terms to imagine that women can be objective and rational. This remains so even when their achievements are indistinguishable from men's. There is no speaking position available to women as rational, objective thinkers since that position has been fully occupied by the masculine. Moreover, those areas of science that are thought least shaped by social values and interests thus are the most vigorously masculine. Precisely because they are thought to be the most neutral, physics, mathematics and logic are the most masculine intellectual areas.

It should be stressed that these arguments about the role of gender metaphors and models in science are no more about individuals' idiosyncratic motivations than are arguments about the role of mechanistic or organicist metaphors. Androcentric individuals are not the issue: cultural assumptions, fears, desires, values and interests are. The metaphors and models used by Plato, Machiavelli, Bacon and Descartes are interesting because of what they reveal of the cultures within which these individuals constructed their texts for imagined audiences.

What should be done about these distorting conceptual frameworks? One widely shared proposal is to recover and revalue the feminine in nature, scientific practice, and the history and philosophy of science in order to enlarge sciences' conceptual resources. If hierarchical models of nature are preferred by cultures seeking to legitimate gender or other social hierarchies, then we lose the chance to understand those 'democratic' aspects of nature's order that are often coded feminine. If masculine models of research are preferred, we lose the chance to understand those aspects of nature's order that could be revealed by methods associated with the feminine. If reason must be divorced from the emotions and objectivity from cultural location, we lose the chance to understand the positive role that emotions and cultures can play in the growth of knowledge.

Another proposal is to seek metaphors and models that do not emphasize the importance of gender difference, and point out the limitations of those that do. We would thus have the chance to grasp heretofore less visible aspects of nature's order as well as undermine the oppressive rule of hegemonic gender difference.

5 Technology

Like the science discussions, feminist approaches to technology have drawn upon recent constructivist tendencies to show how artefacts have politics: technological change is a site for gender struggles over the meanings of and access to technological literacy, the use of new technologies and control over their consequences (see Constructivism). Judy Wajcman's (1988) important analysis focuses on such issues as they occur in the organization of work, reproduction, the built environment, militarism, and computer culture. Research technologies, too, are gendered. Since modern science is often distinguished from other more speculative science traditions precisely by its reliance on experimental methods' technologies of intervention in nature, these studies show yet another way in which the social consequences of sciences are a direct result of features of their cognitive core. If one learns about genes or extra-uterine forms of reproduction by manipulating them, one creates blueprints for how to change them. Technological uses of sciences are partially directed by successful research methods.

These accounts are also valuable because they provide rich resources for understanding how Western claims to scientificity are used to impose technologically oppressive social relations on women in developing countries. Here too, feminist standpoint approaches reveal why philosophies and other social studies of technology should start off their projects from the lives of those who have suffered from Western sciences and technologies, in order to gain a less partial and distorted understanding of their strengths and weaknesses (see Technology and ethics).

6 Objectivity and method

Feminist reflections on the goal of objectivity, the neutrality ideal and methods to achieve these are part of a more general discomfort with the West's assumed authority about the nature of reality and desirable forms of social relations. Five analyses will suggest the range of proposals here.

The first of these was referred to in §4. If objectivity requires neutrality, and neutrality is coded masculine, how can a woman - or a feminism that speaks on behalf of women - ever claim objectivity for women's speech? And how can sciences' claims to objectivity avoid continuing to overvalue manliness? Many feminists have found these objections compelling and have recommended adopting some other language -for example, subjectivism or relativism - for discussing the reliability of our understandings of nature and social relations. However, others have sought to clarify or transform the concept.

Helen Longino (1990) sets out to show how even though science is socially constructed, it already has good procedures for achieving objectivity. The relevance of evidence to a theory is determined by the context of inquiry, by background beliefs. All too often, social or practical interests (contextual values), including gendered ones, in background beliefs have functioned as the cognitive values (constitutive ones) that determine what counts as a good scientific judgment. However, she argues that we can identify these background beliefs independently, and thus show how certain states of affairs have been rightly or wrongly taken as evidence for a hypothesis. Such processes are social and thus public, for they depend upon a scientific community sharing a common language with which to describe experience and intersubjective agreement that screens out idiosyncratic and subjective elements. Most importantly, since the scientific community rather than the individual scientist is the knower, enhanced attention to the role of criticism is crucial for overcoming power imbalances within such a community that can result in the devaluation of legitimate criticisms. Objectivity requires a transformative criticism such that

the community adjusts its assumptions and processes in light of criticism by all of its qualified members.

Evelyn Fox Keller draws on psychoanalytic theory to argue that objectivity is best reconceptualized as profiting from the use of subjective experience rather than as opposed to it. This ‘dynamic objectivity’ contrasts with the prevailing philosophical preference for ‘static objectivity’ through which the knower must take a basically adversarial relation to the objects of study. Such a science, with its rhetoric of domination and coercion, attracts individuals who find emotional and cognitive comfort in such ways of relating to nature and other people to the exclusion of other, at least equally revealing styles, methods and theories of such relations. ‘Good science’ gets defined in an excessively narrow way. Dynamic objectivity ‘ grants to the world around us its independent integrity but does so in a way that remains cognizant of, indeed relies on, our connectivity with that world… dynamic objectivity is not unlike empathy’ (Keller 1984). Dynamic objectivity’s long history can be detected in the thought of the many scientists who have seen their work primarily as an erotic rather than adversarial activity.

Sandra Harding has argued (1991) that the neutrality ideal can usefully be detached from the goal of objectivity; methods for maximizing ’strong objectivity’ can be substituted for it. Androcentrism, Eurocentrism and the like have been shared by virtually entire research communities; they are not the kind of subjective, idiosyncratic values that the research methods activated in the context of justification are capable of detecting. The neutrality ideal is an obstacle to detecting the conceptual practices of power since it categorizes as political only the critics of power, not those who claim the ‘view from nowhere’ within its protective normalizing assumptions and procedures. Standpoint epistemologies, that direct one to formulate questions in the first place from outside the dominant institutions, practices and culture, and to start instead from disadvantaged lives, can provide systematic resources - a ‘strong method’ - for philosophies of the natural and social sciences. Abjuring both epistemic foundationalism and relativism, and careful neither fully to identify with nor to appropriate the voice of the other, standpoint theories insist that only socially situated knowledge, only partial perspectives, are possible. Those issuing from disadvantaged social locations can provide less partial and distorted understandings of nature and social relations.

Donna Haraway’s rethinking of objectivity occurs in the context of her incisive questions about the relation between the production of science (‘technoscience’) and of culture. She develops the ethical and political implications of standpoint theory further, stressing the need for a notion of objectivity that initiates, instead of closing off, issues of responsibility for science’s images of nature and the rational knower. She argues that the objects of knowledge, too, must be reconceptualized:

> A corollary of the insistence that ethics and politics covertly or overtly provide the bases for objectivity in the sciences as a heterogeneous whole, and not just in the social sciences, is granting the status of agent/actor to the ‘objects’ of the world…. Accounts of a real world do not, then, depend on a logic of ‘discovery’, but on a power-charged social relation of ‘conversation’.
>
> (Haraway 1991)

Such an agent could be pictured as the Coyote or Trickster, she proposes, embodied in American southwest Indian accounts, for this figure ‘ suggests our situation when we give up mastery but keep searching for fidelity, knowing all the while we will be hoodwinked’ by nature.

In conclusion, it is striking how little attention has been paid to the philosophic effects of gender relations by even the most radical of mainstream philosophies and social studies of science. In effect they exclude such relations from the realm of the social that otherwise is a major concern. Feminist accounts are more objective in this respect, as well as in their attention to the conceptual effects of race/imperial relations and more rigorous understanding of self-reflexivity issues.

In their attention to relations between power and knowledge, feminist science analyses both reflect and promote the widespread critical re-examination of Enlightenment ideals and their political consequences. Their diverse attempts to envisage post-Enlightenment sciences and philosophies of science join widespread global projects to bring Western sciences under democratic control. And yet the feminist projects also are fully inside Western traditions, for they emerge from and advance one long-standing project there of criticizing the favoured beliefs of the powerful in order to block ‘might makes right’ in the domain of knowledge production.

Genealogy

'Genealogy' is an expression that has come into currency since the 1970s, a result of Michel Foucault's works Surveiller et punir (1975) (Discipline and Punish, 1977) and The History of Sexuality (1976, 1984a, 1984b). Foucault's use of the term continues Nietzsche's in his On the Genealogy of Morals ([1887] 1967). For both philosophers, genealogy is a form of historical critique, designed to overturn our norms by revealing their origins. Whereas Nietzsche's method relies on psychological explanations, and attacks modern conceptions of equality in favour of a perfectionist ethic, Foucault's relies on micro-sociological explanations, and attacks modern forms of domination in favour of radical politics.

1 Genealogy as philosophical method

While some claim that genealogy is a new method for investigating history, others have maintained that genealogy is simply historical investigation itself, and nothing new. Neither of these claims captures what is distinctive about Nietzsche's and Foucault's enterprises. Rather, genealogy is a new method of applying historical investigation to philosophical concerns.

In Book I of the *Republic*, Plato portrays Socrates as seeking substantive philosophical knowledge of justice by discussing proposed definitions of 'justice'. The *elenchus* is the method for testing proposed definitions. In the second essay of *On the Genealogy of Morals* ([1887] 1967, II: 13) Nietzsche claims that 'only that which has no history is definable'. If the expressions which concern us have a history, then Socrates' project fails. We can better clarify the sense behind such expressions as 'justice' by examining the history of the practices that have shaped our disposition to classify some acts as just. According to Plato, we apprehend an unchanging, independently real *eidos* of justice, and it is our capacity to intuit the presence of justice in an act that accounts for our linguistic dispositions. Consequently, the history of our linguistic dispositions can only be the history of our clear vision of what is always already there; such a history cannot possess much philosophical interest. On the genealogist's view, however, there is no such *eidos*. Therefore, it cannot be responsible for our semantic intuitions or our consensus about them. For the genealogist, history itself moulds and shapes our practices and intuitions over time; in an account of what moulds the history, we will find nothing but competing and cooperating forces, interpretations, interests. The genealogist's interest is thus directed at normative practices whose dominance requires that their participants not understand how the practice came to be.

As Nietzsche and Foucault view it, genealogy supersedes earlier forms of philosophy. The sweeping character of this methodological claim rests on the genealogist's confidence that traditional philosophical strategies fail on their own terms. (This point is crucial for escaping the common complaint that the genealogist commits the genetic fallacy.) Traditional strategies falsely presuppose that our intuitions are reliable. If, for example, our moral intuitions were broadly unreliable, traditional moral theory would collapse, given the moral theorist's reliance on these intuitions for data by which to judge the moral theories under discussion. If our conceptual or semantic intuitions are unreliable, similar considerations will apply to conceptual or linguistic analysis.

History, according to genealogists, is not teleological (as it is for Hegel). They cannot identify a *goal* of a historical process, and then go on to show how it gradually emerged from its embryonic beginnings. Rather, they chart the processes that, by contingent confluence, produce a contemporary result. Hence the metaphor: no individual is the goal of a family history. Rather, a family is a vast fabric of relationships, and any one individual represents only one among many confluences of past lines of descent.

To avoid the temptation of projecting current norms into the past, which would promote a teleological picture, genealogy adopts the German historicist view that each cross-section of history has its own autonomous structures, meanings, values, etc. which the historian must work to recover hermeneutically (see Historicism; Hermeneutics). However, unlike the hermeneutic historian, the genealogist allows that the alien culture's self-understanding is not the end, but the beginning of investigation. Since the function of genealogy is to undermine our own hermeneutical self-understanding, we cannot grant self-understanding final authority elsewhere either.

What determines the content of such a self-understanding is, ultimately, multiple conflicting interests and interested interpretations. Genealogy characterizes the underlying historical processes as a 'power struggle'. Just

as an account of a war will differ depending upon which combatant pens it, aspects of these historical processes will appear differently to different viewers. Attention to this plurality of 'perspectives' leads the genealogist to claim that there is no absolute fact as to the significance or value of a particular historical event or process. If we add the claim that experienced fact is largely constituted by the interpretations of those experiencing it, a question arises: does it make sense to speak of historical fact at all? This feature of genealogy raises familiar epistemological problems, and sits uncomfortably with its intended critical function. However that may be, the genealogist does *not* claim that one perspective is as good as another, either normatively or cognitively. Genealogy serves a critical function, undermining the myths and mystifications a particular contemporary perspective may have about itself. To the extent that the perspective depends upon mystification, participants' understanding of the processes that constructed the perspective will lead to its disintegration.

The critical nature of genealogy can be understood as follows. The genealogist is concerned to undermine ahistorical and inflationary interpretations of mundane facts about human life. These interpretations typically appeal to structures, norms, entities, etc. which stand above both nature and history. The genealogist is also apt to undermine the propensity to regard what is artificial (and therefore mutable) as naturally, rationally or metaphysically necessary (and therefore immutable). Norms may appear to possess a greater degree of legitimacy if they are associated with such necessities as opposed to artifice. If norms are artificial, produced by struggle and veiled by mystification, they will be an expression of someone's pragmatic interests. Inflationary interpretations conceal these interests and the ways that the practice in question promotes them.

Finally, genealogists must accept that they too are engaged in a practice (doing genealogy) which has a history, which expresses various pragmatic interests, which is perspectival, etc. Whether genealogy's reflexivity hoists the genealogists by their own petard has been much discussed since the 1970s.

Many broad themes of contemporary genealogical inquiry have resonances in earlier European intellectual history. The notion of the artificiality of norms, and their emergence from conflict is central to social contract theory since Hobbes (see Contractarianism). However, modern dissenters from social contract theory laid the groundwork for Nietzsche's novel interpretation of morality. Though himself a social contract theorist, in the *Discourse on Inequality* ([1755] 1988) Rousseau transforms the model *state of nature-contract-civil society* into an anthropological and historical, if speculative, narrative. Rousseau outlines how we might have first become social. Later, through mystified economic processes, we come to consent to political institutions which benefit the wealthy at the expense of the poor. By emphasizing the historical and artificial character of this process, Rousseau rejects the social contract arguments defending the economic and political institutions of his day.

2 Nietzsche

The image of Rousseau haunted Nietzsche throughout his career. Both the similar styles of argumentation, and the aristocratic values Nietzsche champions make 'A Discourse on Equality' an apt alternate title for his *Genealogy*. Nietzsche's thoughts on the development of morality can be seen in several texts prior to the *Genealogy*. In 'On the Utility and Liability of History for Life' ([1873b] 1995), Nietzsche deplores the rise of 'disinterested' historical research, which has replaced more edifying and useful portrayals of the past with pointless accumulations of fact. Creative living requires that we often forget the past. If we are to benefit from the study of the past, we must practise history with one or more of three aims in mind. 'Antiquarian history' seeks to revive the lost cultural treasure house of the past. 'Monumental history' seeks to memorialize ethically exceptional individuals and deeds, which we might wish to emulate. 'Critical history' uncovers the evils of the past that we might better renounce them in the present. All three forms appear woven together in several later works: 'On Truth and Lie in an Extra-moral Sense' ([1873a] 1990), 'On the History of the Moral Sensations' in the first volume of *Human, All Too Human* ([1878] 1986), 'Natural History of Morality' in *Beyond Good and Evil* ([1886] 1966) and the *Genealogy* itself.

In the first essay of the *Genealogy*, Nietzsche argues that 'English psychologists' err in regarding the original sense of 'good' as 'useful'. The sense of 'good' varied, depending upon which class perceived it. For the dominant class, or 'masters', the primary sense of what is good is the self and that which resembles the self. By contrast, the socially subordinated, the 'slaves' behave in very different ways, which the master designates as 'bad', ignoble or base. However, from the slave perspective, what the master calls 'good' causes the slave's suffering and subordination. Thus, he designates the master as 'evil' or wicked. The slave then invents the fiction of free will.

The master is free to not behave in a wicked way, and the slave is equally free to begin to do so. The slave then constructs a moral scheme according to which his own passivity makes him morally superior to the master and therefore 'good'. Here we see many characteristic themes of genealogy sounded: pragmatic interests, perspectivality, demystification. The relevance of Nietzsche's critique of Christianity is clear. Beyond that, he broadens his analysis by claiming that modern liberal institutions, norms and intuitions are so much secularized Christianity. Thus liberalism inherits much of Christianity's unappetizing 'slavishness' without the religious rationale which legitimated it.

In the second essay of the *Genealogy*, Nietzsche traces the psychological origin of guilt to the primitive experience of debt (at a time when enforcement of debt was more cruel than now). Anticipating Freud, he speculates that the inner mechanism mediating this experience is the product of introjected aggression. While we cannot dismantle the conscience, we can 'reprogramme' it with values and standards other than those derived from slave morality. In the third essay, Nietzsche asks why we regard asceticism so highly. He reveals its psychological roots in the sour grapes of the ascetic. Its persistence is due to the socially stabilizing function of the ascetic's ideology of sin and contrition. Furthermore, modern science is an outgrowth of the ascetic ideal, its self-hating contempt for pleasurable illusion expressing itself as a commitment to truth. These essays stand as early paradigms of genealogical critique.

3 Foucault

Foucault turned towards Nietzsche and genealogy late in his career. In his earlier, 'archaeological' works, Foucault analysed medicine, the human sciences (for example, economics, linguistics, biology) and philosophy. According to Foucault, structured codes organize scientists' perception, discourse and social practices at a level unknown to them. Such codes, or 'epistemes', play a quasi-Kantian role, as 'conditions of the possibility' of knowledge. Foucault's conception of episteme thus makes the work of scientists subject to a cultural force beyond anyone's conscious control. His conception of these epistemes and their historical succession is indebted to the later Heidegger's conception of a 'history of being' as well as to the work of the structuralists (for example, Althusser, Lacan, Lévi-Strauss) (see Heidegger, M.; Structuralism). His later turn to genealogy would inherit both the culturalism, and the epistemological interests, of his earlier work.

Foucault came to believe that he was reifying unduly in claiming that epistemes, which are abstract, governed (at least some domains of) social life. Instead, he substituted the notion of regimes of power, which coerce people into following specific norms. The mechanisms which maintain this coercion are micro-practices demanding specific kinds of behaviour in specific contexts (for example, the use of time-cards and clocks in factories). Although these micro-practices in effect subordinate some people to the benefit of others, they need not be the products of any deliberate design.

Foucault's analysis of society often seems to jump from detailed concrete descriptions of micro-practices, to more impressionistic claims about the common style of the micro-practices. This common style betrays a pervasive, invisible, impersonal force: power. Power structures behaviour; at the same time, it structures the perception, discourse and practices of scientists who are concerned to understand human behaviour scientifically. Foucault's account of the relationship between power and knowledge echoes Nietzsche's in *Genealogy* Essay III. However, where Nietzsche's analysis of the will to truth depends on *psychological* explanations, in Foucault's, micro-sociology and a broad cultural thematics replace psychology.

Foucault's genealogical method, which he sketches in 'Nietzsche, genealogie, histoire' (1971), does not merely echo Nietzsche's concern with power. Both philosophers' historical inquiries are directed at practices whose character bears on philosophical concerns (for example, the nature of personal and political freedom, the value of self-knowledge). Furthermore, Foucault's analyses, like Nietzsche's, portray historical processes with an emphasis on their contingent, non-teleological character. He is sensitive to how alien even something as recent as the Enlightenment can appear, if viewed through historicist lenses. However, what links him most decisively with Nietzsche is his commitment to demystifying accounts of the historical processes that most concern him. We easily ignore our 'disciplinary' practices in their institutional home, the prison, because our ideological commitments interpret such practices as just. Once we see the practices described in coolly non-ideological terms and in concrete detail, we clearly perceive their outrageousness. What is more, the presence of similar 'carceral' practices in other social domains can then be more clearly perceived. Foucault intends his readers to transpose their outrage from the

one setting to the other. His work thus shares Nietzsche's critical intent: Nietzsche wishes to use his critique as a tool to re-animate 'noble' values, whereas Foucault places his critique in the service of radical politics.

Foucault had intended to continue his genealogy of modernity. He meant to supplement his account in *Discipline and Punish* (1975) of the growing 'carceralization' of modernity with a parallel account of its growing 'sexualization' in the projected multi-volume *History of Sexuality*. However, after one promising introductory volume, Foucault turned his attention away from the historical processes that culminated in contemporary society. Instead, he turned toward the genealogy of Western ethical ideals, and their relationship to sexual self-mastery. This project begins with an analysis of Greek ethics in *The Use of Pleasure* (1984a), and continues with an account of Roman ethics in *The Care of the Self* (1984b). A final volume, which was to deal with medieval ethics and the 'hermeneutics of the self' has not yet appeared. In these final works, Foucault relegates his political passion, so reminiscent of Rousseau, to the background. Instead, we see the beginnings of work much closer in subject and spirit to Nietzsche's original concerns.

General relativity, philosophical responses to

Much of the early philosophical attention given Einstein's theory of gravitation was not uncontaminated by a grim post-war atmosphere conducive to public diversions, hysteria and national chauvinism. Most was ill-informed regarding the mathematical and physical content of the theory. Even amongst the scientifically literate, there was disagreement as to the theory's philosophical implications. In part, this lack of clarity is due to Einstein. In an endeavour to eliminate references to 'absolute space' as the earlier special (or, as it was then known, restricted) theory of relativity (STR) had eliminated reference to 'absolute time', Einstein had motivated his theory of gravitation as arising from an epistemologically mandated generalization of the relativity principle of STR, which governed only inertial motions, and he misleadingly baptized it a theory of 'general relativity', wherein all motions are regarded as relative to other bodies. This the theory does not show. Also, some incautiously expressed remarks on the formal requirement of general covariance were seized upon as evidence for antithetical epistemological and ontological attitudes. Amidst such confusions, it is not at all surprising that inherently antagonistic philosophical outlooks claimed vindication or confirmation by the general theory of relativity (GTR). In turn, the perceived failure of both Machian positivism and Neo-Kantianism to accommodate the revolutionary theory spurred the development of a new 'scientific philosophy', logical positivism. The subsequent course of philosophy of science in the twentieth century was indelibly marked by this development. Yet it would turn out that Einstein himself refused to be a cooperative exemplar for any of the major philosophical schools, positivism, Kantianism, or, to its embarrassment, logical positivism.

1 Positivism

Positivists generally welcomed the special theory of relativity (STR), viewing Einstein's operational analysis of the 'simultaneity' of separated events as a vindication of Mach's account of concepts as mere tools, economical shorthand for operations exhibiting the dependence of phenomena on one another (see Logical positivism §§2, 4; Mach, E.; Operationalism). Some of Einstein's epistemological remarks in the context of STR appear to underscore this alignment: for example, ' The concept does not exist for the physicist until he has the possibility of discovering whether or not it is fulfilled in an actual case' (Einstein 1917: 22). Such pronouncements served to cast Einstein's philosophical orientation in a positivist light and, naturally enough, promoted tendencies both to fashion similar interpretations of the general theory of relativity (GTR) and, in view of ensuing difficulties, to criticize GTR as a violation of Einstein's own methodological precepts (Bridgman 1949).

A single passage from section three of Einstein's 1916 exposition of GTR provided further grist for the mill of Machian positivism. There, in the course of a heuristic 'reflection' on the reason for the necessity of general covariance of the field equations of gravitation (that they remain unchanged under arbitrary transformation of the coordinates), Einstein proclaimed that this requirement, 'takes away from space and time the last remnant of physical objectivity' since 'all our space-time verifications invariably amount to a determination of space-time coincidences' and that consequently, 'all our physical experience can ultimately be reduced to [point-event] coincidences'. Following the interpretation given these remarks by the Machian physicist Philipp Frank, the philosopher Joseph Petzoldt stated that 'the theory of relativity rests, in the end, on the perception of the coincidence of sensations' and, in particular, that GTR 'is fully in accord with Mach's world-view, which is best characterized as relativistic positivism', his designation for Mach's philosophical direction (see Petzodt 1921: 516). Despite the obvious embarrassment of Mach's apparent disavowal of the theory of relativity in the 'Preface', dated 1913, to his posthumously published (1921) book on physical optics (Mach died in 1916), Einstein's illustrative reflection seemed an incontrovertible avowal of the centrepiece of Mach's phenomenalist epistemology with its attendant ontological parsimony.

Contemporary scholarship has shown that these remarks of Einstein were but elliptical references to an argument for a different and considerably more intricate conclusion, that the points of the spacetime manifold have no inherent individuality (inherited say, from the underlying topology) (see Spacetime), hence they have no reality independently of the presence of physical fields defined on the manifold (Stachel 1989). And while Einstein made no secret of his ambition in the context of GTR (in recognition of a 'general principle of relativity') to fully implement what he termed 'Mach's programme' against Newtonian 'absolute motions', he had already distanced himself from Mach's phenomenalist epistemology. As for the infamous 'Preface', a strong case has recently been

made that it was forged after Mach's death by his son Ludwig, under the influence of a rival guardian of Mach's legacy, Hugo Dingler.

2 Neo-Kantianism

Among the scientifically minded philosophical community of Wilhelmian and early Weimar Germany, the philosophy of Kant held pride of place, with that of Mach a distant second. Only a few Kantians adopted strategies to preserve Kantian orthodoxy intact in the face of empirical success of GTR, for example, claiming that Kant's views on space and time pertained solely to a psychological 'intuitive space' and were not touched by Einstein's empirical theory of spacetime (Sellien 1919). Others sought vindication on grounds which downplayed the doctrine of space and time, for example, holding that Einstein's finite but unbounded universe supported the dialectical argument of the first antinomy of pure reason (Schneider 1921). But since, according to GTR, the behaviour of light rays and measuring rods in gravitational fields no longer corresponded to the relations of Euclidean geometry, knowledgeable Kantians concluded that the necessarily Euclidean character of space claimed in the transcendental aesthetic (TA) was untenable (see Kant, I. §5). At least, that is, in finite regions, for it could be maintained that those (essentially gravitation-free) infinitesimal regions where the rigorous validity of STR was upheld within GTR did conform to Kantian a priori conditions of experience (Cassirer 1921: 436-7; Bollert 1921: 61). As a matter of mathematical fact, the metric in the immediate neighbourhood of any point in a Riemannian manifold (such as is employed in Einstein's theory of gravitation) is 'locally Euclidean' (in spacetime, pseudo-Euclidean, for example a Minkowski metric); in such regions the spacetime manifold is homogeneous, isotropic and flat. But it is not generally possible to extend this metrical characterization to cover the entire spacetime manifold since the generic spacetimes allowed in GTR are inhomogeneous and variably curved (see Spacetime §3). And these latter do fall outside the supposed necessity of conditions of possible experience.

Characteristically, the deliverances of the new physics were accepted as fact while resources broadly within Kantian orthodoxy were sought for updating 'critical idealism'. Bollert (1921, cited by Gödel 1946/9) 'clarifies' the latter as concerned with the identification of progressively deeper 'levels of objectivation' underlying physics; in this regard, GTR, with its variably curved spacetimes, is a further step below the space and time of both Newton and STR. More influential was Ernst Cassirer's interpretation of Einstein's comment that space and time have lost 'the last remnants of physical objectivity'. According to Cassirer, GTR confirms the pivotal Kantian lesson of the ideality of space and time, that space and time are not 'things' but only 'forms of appearance' or, better, 'ideal principles of order'; each is a schema applying to the phenomena of the external world as a necessary condition of their possible experience (see Space §3). GTR has thus given explicit formulation to what Kant tried, with partial success, to articulate in the doctrine of 'pure intuition', namely, space and time are methodological presuppositions of empirical knowledge in physics. What remains of 'pure intuition' are 'the serial form of the relations of coexistence and succession', a structure consisting of (broadly speaking) topological relations which is far more impoverished than a globally Euclidean metric. In the light of GTR, Cassirer recast Kant's doctrine of space and time as essentially a version of Leibnizian relationism (see Leibniz, G.W. §11).

A more radical revision of Kant is given in Winternitz (1924) for whom the essential Kantian conception is just the recognition that the world is *nicht gegeben, sondern aufgegeben* (not given but posed) to us as a task (see Kant, I., *Critique of Pure Reason*, A498/B526). Regarding the TA as undeniably asserting the necessarily Euclidean character of geometry, hence in direct contradiction with GTR, Winternitz accordingly jettisoned it as a confusing and unnecessary appendage to what is taken as the fundamental Kantian endeavour: to establish the a priori presuppositions of physical knowledge. These are spatiality and temporality as 'unintuitive schemata of order' in general (as distinct from any particular chronometrical relations), the law of causality and assumption of continuity of physical processes, the principle of sufficient reason, and the conservation laws. Remarkably, the *necessity* of each of these putative a priori elements was soon to be challenged by the new quantum mechanics (see Quantum mechanics, interpretations of).

3 Logical positivism

The last redoubt still held by Kantians concerned the existence of synthetic a priori elements of physical knowledge; their defence was also attempted in the earliest works of Rudolf Carnap and Hans Reichenbach. Carnap's first philosophical publication, his dissertation on space (1922), essentially seeks a reconciliation

between GTR and the Kantian notion of a form of intuition. Carefully distinguishing between intuitive, physical and mathematical conceptions of space, Carnap also draws upon the infinitesimal validity of Euclidean geometry in a Riemannian manifold to argue that this geometry is presented in the intuition of a limited region. But since the global extension of this structure depends upon conventions, Euclidean geometry is not constitutive of experience in Kant's sense. Instead, inspired by Einstein's remarks on point coincidences, Carnap conceives the empirical content of physics ('matters of fact') as entirely given by spacetime coincidences while, as a synthetic a priori condition of the possibility of experience, intutive space is assigned a structure of topological relations since these alone preserve empirical content for all possible metric stipulations. By the late 1920s, Carnap had come to view form solely in logical or analytic, not synthetic, terms, concluding that 'there is no synthetic a priori'. This declaration became an article of faith among logical empiricists (see Carnap, R.).

Of all the logical empiricists, Reichenbach wrote the most extensively about problems of space and time and the philosophical interpretation of GTR. His early work (1920) also attempts to reconcile GTR with the Kantian emphasis on the a priori, although a modification in the conception of the a priori must be made in view of inconsistencies resulting from a straightforward combination of Kantian precepts and empirically confirmed principles of GTR (for example, the equivalence of inertial and gravitational mass). Reichenbach suggested that of the two primary senses of the Kantian a priori, as valid for all time and as constitutive of the object of knowledge, only the latter was compatible with the new physics of GTR. The remnant of the a priori is placed in 'principles and axioms of coordination', linking the (analytic) mathematics of physical theory with objects in the physical world, in effect, 'constituting' the latter. The systematic task of the philosopher of science now becomes the provision of an 'axiomatic' analysis of domains of physical knowledge. The aim here is to locate a theory's empirical core and then sharply to separate this 'objective content' from 'the subjective contribution of reason', systems of equations and the respective principles of coordination (seeTheories, scientific). Reichenbach came to view the important role of coordinative principles in less and less Kantian terms, stressing instead their character as freely chosen conventions or definitions, not derived from experience but essential to the applicability of mathematical theory to physical reality. From this viewpoint, 'the philosophical significance' of GTR is that it shows how empiricist analyses of scientific knowledge must be tempered with a recognition of the fundamental role of conventional elements in the basic propositions of physical theory. Thus, in order to obtain empirical spacetime measurements, certain stipulations must first be made governing the behaviour of measuring rods and clocks. Reichenbach's analysis of the relation of mathematical theory to empirical objects in terms of 'coordinative definitions' became a central tenet of the standard 'received view' of scientific theories dominant in philosophy of science till the 1960s (see Reichenbach, H.).

The founder of the Vienna Circle, Moritz Schlick, was already an opponent of the Kantian conception of physical knowledge; he had not yet embraced neopositivism (see Schlick, F.A.M. §1). In one of the earliest lay monographs on GTR, Schlick argued (1917), in a concluding philosophical section applauded by Einstein, for a tempered realism about physical theories which nonetheless recognized that no physical theory fails to have at least some arbitrary elements. Subsequently (1921), he subjected Cassirer's very general defence of a priori elements as methodological presuppositions in physical knowledge to a withering critique, arguing that such vague formulations could have no physical significance and hence were best abandoned. Together with H. Weyl, who was fundamentally opposed to positivism, Schlick emphasized that the union of space, time, *and* matter wrought by the geometrization of gravity in GTR is a mind-independent reality. Of course, Kant does not allow, on pain of surrendering transcendental idealism, that there is a coherent conception of space except as a form of sensibility.

4 Einstein's response

Einstein's reaction to the various philosophical appropriations of his theory are perhaps most widely known through casual remarks made in other contexts, but they may be tracked more closely in several explicit encounters: a meeting at the Sorbonne in Paris on 6 April 1922, with French philosophers, physicists and mathematicians, and in several rare book reviews of philosophical works dealing with his theory. The significance of these encounters lies in how Einstein distinguishes his views from others, not in the presentation of a comprehensive alternative. At the Paris meeting, Einstein made short shrift of Machian philosophy, praising Mach as a 'good mechanician' (no doubt in reference to Mach's views of the relativity of motion) but as a 'deplorable philosopher'. In this venue Einstein also suggestively remarked that 'each philosopher has his own Kant', probably alluding to the plethora of Kantian attempts to assimilate GTR, but perhaps as well intentionally

including himself. In this regard, it is instructive to consider that his most fully articulated objection to claims of the necessity of a priori elements in physical knowledge, voiced in a review of an otherwise forgettable book by a student of Cassirer (Elsbach 1924), is considerably different from the verificationist objections of Schlick. It is not that such elements are so general as to be beyond empirical confirmation or disconfirmation but rather that it is entirely arbitrary *which* components of a theoretical system are to be considered a priori. Here also Einstein concedes the justice of the criticism, already implicitly made by Cassirer, of his remark (cited in §1 above) that concepts in physics have validity only if they are individually connected with experience; now an explicitly holist line is affirmed: ‘ in general, it is not to single concepts but only to the system as a whole that possible experiences must correspond’ (1924b: 1,692). Reviewing Winternitz’s book, Einstein expressly agrees with the Kantian point that the fundamental principles of a theoretical structure ‘do not themselves originate in experience’; the difference with Kantians arises only in Einstein’s view that such principles are ‘ *insgesamt* [collectively] mere conventions like the ordering principle of words in a dictionary’ (1924a: 22). Interestingly, late in life Einstein returns to the language of Winternitz’s formulation of the essential Kantian postulate, that the world is ‘not given but posed’ as comprising ‘the truly valuable’ in Kantian doctrine. As before, however, Einstein takes the so-called categories not as ‘unalterable’ but as ‘(in the logical sense) free conventions’ (1949: 680, 674). Finally, in a review of a work which emphasized the on-going development (then underway by Einstein and others) of GTR into a ‘unified field theory’ which would contain all laws of nature as logical consequences, Einstein appears to endorse Meyerson’s explicitly realist orientation, noting that ‘ at the basis of all physical science lies a philosophical realism’ (1928: 253) (see Meyerson, É.). Expressions of such ‘metaphysical’ articles of faith, made with increasing frequency in his later years, were anathema to logical positivism.

General will

The fundamental claim for general will is that the members of a political community, as members, share a public or general interest or good which is for the benefit of them all and which should be put before private interests. When the members put the general good first, they are willing the general will of their community. The claim was given special and influential shape by Rousseau. He produced a comprehensive theory of the legitimacy of the state and of government, revolving around the general will. Some contend this solves the central problem of political philosophy - how the individual can both be obliged to obey the state's laws, and be free. If laws are made by the general will, aimed at the common good and expressed by all the citizens, the laws must be in accordance with the public interest and therefore in the interest of each, and each is obliged by the law yet free because they are its author. Rousseau's formulation has been much criticized. But others have found it essentially true and have variously adapted it.

1 Rousseau and the general will

Rousseau's general will is the will of a people or state (see Rousseau, J.-J. §§2-3). A people is not a natural society as is the family, but conventional. Rousseau uses the framework of social contract theory: independent individuals (men only) freely, equally and unanimously bind themselves into a single association (see Contractarianism §6). Thereby private persons become a public person, the people, and a collective body, the state, with a single will. That will is necessarily general in its object, its source and its application. (1) It aims exclusively at the common good of the whole body, which is the good of every member, good being moral personhood, freedom, and security under the law, possible only in a state. (2) The will of the whole body can be expressed only through the wills of its parts, that is, by all the members voting together. It is impossible to transfer one's will, so no member can give his right to express the general will to a representative or government or leader. Rousseau thus ties the general will to direct popular sovereignty. (3) The general will, in the form of laws, applies equally to all members.

The laws of a society ought to conform to the general will, and its government ought to conform to the laws. Rousseau realizes this would happen only if certain conditions are met, and the individual associates together consider themselves a single body so that they have a single will. The members of the state, the citizens, must be socialized to be patriotic and public spirited. There must be no extremes of wealth and poverty to heighten conflicting private interests. Private associations, factionalizing society and encouraging citizens to substitute a partial interest for the general interest, must be prevented or controlled. The government, appointed by the people as its servant, and potentially the most dangerous partial interest, must be kept in its place.

These conditions met, the general will is obvious to every citizen and guides the state according to the common end for which it was instituted. The citizens remain equal; none can impose a burden on others without undertaking it himself. The laws are just, being in the common interest. Everyone is free, because each individual obeys laws which he has made himself and which require what everyone wants for himself.

2 Criticisms

Some common criticisms rest on misunderstanding. Rousseau is attacked for stating that the general will is 'always right', that if one is outvoted that shows one made a mistake, and that one can be 'forced to be free'. These claims startle, but can be understood as true by definition provided the conditions for the expression of the general will are met.

Other criticisms, of both the general will having a general object and of its being willed generally, are more serious. It can be denied that individuals in a society constitute, or can constitute themselves, by a contract, a kind of person with a single will. This objection raises controversial and unsettled issues about the nature of social wholes. Even if such a 'person' is possible, it can still be denied that there can be a general interest which is in the interest of all members of a society. It can be argued that on specific matters, there is no policy or action which is in everyone's interest because individuals tend to have different aims and desires. People may agree, but that agreement is contingent, temporary, subjective and possibly arbitrary. Rousseau's belief that all men have the same basic moral and material interests (see his *Discourse on the Origins of Inequality* (1755)), so that they share a permanent and objective interest, requires assumptions about human nature and men's true interests which are

disputable (see Public interest §2).

If the idea of a public interest and a general will aiming at it is accepted, it is still vulnerable to powerful criticism. It can only be expressed through the votes of all the citizens, unanimously or by a majority. Rousseau admits the people's deliberations are not always right: a people is often fooled. But he offers no clear way of determining which majority decisions express the general will and which do not.

Even when the public interest is known, Rousseau recognizes that men are inclined to give preference to their own personal interests (which may be opposed to each other and to the public interest), following their private, particular will rather than the general will. This could be prevented, but only under improbable conditions and at great cost. In a suitably small and socially homogeneous society, if it could be established, all the citizens might well be sufficiently close in their values and aims to agree on common interests and put them first, as Rousseau found so admirable in ancient Sparta. However this would involve a high degree of deliberate socialization. The society's institutions would be designed to make citizens uniform. Under such conditions, the emergence of a general will is more plausible; but the price would be a society in which individuality was not developed but discouraged. There is always a balance to be struck between the freedom of individual members of society and the restrictions necessary for its existence. Rousseau's general will seems to require minimizing the individual's freedom, in the public sphere at least.

3 Later versions

Attempts, not altogether successful, have been made to retain the essence of Rousseau's idea while abandoning elements which are subject to criticism. Kant (§10) holds that it is not necessary that the people actually express the general will: it is enough if the law is what the people ought to have willed if they had been asked. The general will becomes hypothetical, what rational men would will, and operates as a 'regulative ideal', a standard to guide conduct. This avoids the practical problems in Rousseau. However, an acceptable test of what laws it is rational to will is needed, and what Kant provides - a political version of his categorical imperative - is disputable.

Hegel (§8) dispenses with social contract theory, and its individualism, instead situating the general will in actual historical societies. The moral and cultural beliefs and ideals of a society, and the legal, moral, economic, social and political institutions and practices which embody them, are its general will as it has developed; each society has established its own view of the public good. Its individual members learn this as they grow up, and express it and contribute to its further development as they live their lives in and through the society and its beliefs, rules and institutions. The general will ceases to be an ideal, hard to realize practically, and is given specific concrete content. Responsibility for expressing it is given to the civil service and the government. The people does not legislate directly, but elects representatives. Private associations are no longer seen as factional but as important media for the education of citizens. This is the general will brought down to earth - perhaps too much. Hegel realizes the ideas and institutions of one's society are inadequate in various ways; however, the direction of reform is indicated only very generally.

Recently the general will has been considered in terms of social choice theory (see Social choice). This has led to some clarification, especially of how the general will might emerge through voting. However, to the extent that this approach aggregates individual preferences (taking individuals as isolable from their society), and sets no moral limit to the content of decisions, it departs significantly from Rousseau's and gives the term a different meaning. Rousseau's general will requires the existence of a social unity between individuals, who thereby have a collective interest as members of that union in addition to their private interests as individuals; their general interest is to have a certain kind of society, bringing everyone specific moral benefits; and the verdict on what the general will is in any particular case must be delivered by the citizens themselves. Hence Rousseau's ideas, although complex and problematic, remain relevant, for instance to debates about freedom, democracy, republicanism and communitarianism.

Genetics

Genetics studies the problem of heredity, namely why offspring resemble their parents. The field emerged in 1900 with the rediscovery of the 1865 work of Gregor Mendel. William Bateson called the new field 'genetics' in 1905, and W. Johannsen used the term 'gene' in 1909. By analysing data about patterns of inheritance of characters, such as yellow and green peas, Mendelian geneticists infer the number and type of hypothetical genes. The major components of the theory of the gene, which proposed the model of genes as beads on a string, were in place by the 1920s. In the 1930s, the field of population genetics emerged from the synthesis of results from Mendelian genetics with Darwinian natural selection. Population geneticists study the distribution of genes in the gene pool of a population and changes caused by selection and other factors. The 1940s and 1950s saw the development of molecular genetics, which investigates problems about gene reproduction, mutation and function at the molecular level.

Philosophical issues arise: the question about the evidence for the reality of hypothetical genes, and the status of Mendel's laws, given that they are not universal generalizations. Debates have occurred about the nature of the relation between Mendelian and molecular genetics. Population genetics provides the perspective of the gene as the unit of selection in evolutionary theory. Molecular genetics and its accompanying technologies raise ethical issues about humans' genetic information, such as the issue of privacy of information about one's genome and the morality of changing a person's genes. The nature-nurture debate involves the issue of genetic determinism, the extent to which genes control human traits and behaviour.

1 Historical development of Mendelian genetics

Mendelian genetics arose from three traditions in the nineteenth century: one, the hybridist tradition of Mendel; two, speculative theories of heredity, variation and development; and, three, studies of the hereditary variation important in evolutionary change. Genetics emerged when the problems of heredity and embryological development were separated: the transmission of hereditary characters through generations can be studied independently of the development of the characters in embryos. Thus, bifurcation rather than unification marked early progress in genetics. Only recently have efforts to reunite genetics and embryology begun to be fruitful.

Mendel and Darwin viewed organisms as being composed of separable unit-characters that could vary independently of one another. The focus on contrasting variations among individual organisms, rather than on the similarities on which taxonomists had focused, was a key conceptual shift that enabled the development of both Darwinian natural selection and Mendelian genetics (see Evolution, theory of §1).

Mendelian genetics is usually presented by following the details of an exemplary cross-breeding experiment. The technique used by the Mendelian geneticist is artificial breeding. For example, pure breeding plants that produce yellow peas are bred with others that produce only green peas. The resulting hybrid peas are all yellow. After the hybrids self-fertilize, the resulting peas occur in a ratio of three yellow to one green. The empirical generalization of $3{:}\,1$ ratios is explained by assuming the existence of paired genes. It is a matter of dispute how much of this explanation is found in Mendel's paper. The post-1900 account assumes that paired genes occur in the pure breeding parents: designate yellow, AA; green, aa. The hybrid has the 'phenotype' of the dominant parent, yellow, but its 'genotype' is Aa. During the formation of germ cells in the hybrid, the two genes segregate (separate) to form germ cells (pollen and eggs) that are either A or a. Segregation is the key theoretical assumption of Mendelian genetics. The two types of germ cell form in equal numbers and combine randomly during fertilization; symbolically: $(\mathrm{A}+\mathrm{a})(\mathrm{A}+\mathrm{a})=1\mathrm{AA}+2\mathrm{Aa}+1\mathrm{aa}$. The AA and Aa plants have yellow peas; the aa, green. These theoretical assumptions thus explain the empirical generalization of $3{:}\,1$ ratios. Numerous characters in plants and animals exhibit such ratios. The law of segregation is also called 'Mendel's first law'.

Although Mendel himself did not distinguish them, Mendelian genetics came to contain what are called 'Mendel's two laws'. Mendel's second law was formulated separately only after exceptions were found, and is called the 'law of independent assortment'. The law states that genes for different traits, such as pea colour and pea shape, are inherited independently. In 1910, Morgan explained anomalies for independent assortment by postulating that some genes are linked in inheritance. Thus, the overgeneralization that all genes assort independently was specialized to the claim that all genes in different linkage groups assort independently. Linkage is explained by the

chromosome theory, which is discussed in §2. Because of the significant changes that linkage introduced, the field is sometimes called ‘Mendelian-Morganist genetics’.

In 1926, Morgan stated what he called ‘the theory of the gene’:

> The theory [of the gene] states that the characters of the individual are referable to paired elements (genes) in the germinal material that are held together in a definite number of linkage groups; it states that the members of each pair of genes separate when their germ-cells mature in accordance with Mendel’s first law, and in consequence, each germ-cell comes to contain one set only; it states that the members belonging to different linkage groups assort independently in accordance with Mendel’s second law; it states that an orderly interchange - crossing over - also takes place, at times between the elements in corresponding linkage groups; and it states that the frequency of crossing-over furnishes evidence of the linear order of the elements in each linkage group and of the relative position of the elements with respect to each other.
>
> (Morgan 1926: 25)

The occasional crossing over between genes in corresponding linkage groups enables the construction of genetic maps, which show the relative positions of genes to each other. Numerous questions were left unanswered by the theory of the gene of the 1920s. What is the chemical nature of the gene? What is the size of the gene? How do genes mutate and then stably reproduce those mutations? How do genes function to produce characters? These questions were not answerable by the technique of artificial breeding of Mendelian genetics.

2 Reality of the genes

The genes were hypothetical, theoretical entities, whose numbers and types were inferred in order to explain the distribution of characters in breeding experiments. The first step in providing the physical basis of heredity was the proposal in 1903-4 of the chromosome theory, the claim that Mendelian genes are arranged linearly along the chromosomes, which are thread-like bodies in the nuclei of cells. The chromosome theory was an interfield theory which integrated findings from the fields of cytology and genetics. Information about chromosomes, obtained by fixing and staining parts of cells and viewing them in a microscope, was related to information about genes, inferred from patterns of inheritance of characters. Predictions were made about the behaviour of chromosomes, based on genetic information, and vice versa. Chromosomes are chemically composed of proteins and deoxyribonucleic acid (DNA). Early speculations were that the genes were proteins. That view was challenged in the 1940s and 1950s as evidence mounted that DNA is the genetic material (or occasionally ribonucleic acid - RNA). The field of molecular biology (also called ‘molecular genetics’) emerged with the discovery of the double helix structure of DNA by Watson and Crick in 1953. By 1970, numerous problems had been solved: gene reproduction (opening and copying of the double helix of DNA), the genetic code and the sequence hypothesis (three bases along the linear length of the DNA code for one amino acid in a linear protein), and genetic function (DNA is transcribed to messenger RNA which is translated to protein). From a molecular genetics perspective, genes are segments of DNA or RNA which code for a molecular product or regulate or otherwise influence other genes. After 1970, a new era of molecular genetics began. With the discovery of enzymes that precisely cut and ligate DNA, DNA from widely divergent species can be recombined. Techniques for sequencing DNA have made possible the human genome project in which all the DNA in a human will be sequenced (see Molecular biology; Scientific realism and antirealism).

3 Universality of genetic laws

Philosophers trained in logic are fond of universal generalizations. At least some laws in physics appear to be universal generalizations, admitting of no exceptions, applying to all objects in the universe and throughout all time (at least after the first three minutes following the Big Bang). Biology seems to lack such strong universal generalizations. Although all living things on earth share enough of their metabolic and genetic machinery to indicate a common origin for all life, exceptions to generalizations abound. Certainly Mendel’s two laws are not without exceptions. The $1:1$ segregation of genes is violated when one gene knocks out its competitor. Such segregation distortion is uncommon, but does constitute an exception to the law of segregation. The oversimplification that one gene is associated with one character was complicated when it was found that one gene can influence many characters and one character may be influenced by many genes. One character is not always dominant over another; the hybrid can show a blend of the two parental characters or even a character different

from those of its parents. Special-case exceptions also exist for the general claims of molecular genetics, such as the universality of the genetic code and the claim that DNA is the genetic material.

Given the perspective of evolutionary theory, namely that adapted variants survive in natural selection, such variation and lack of universality are not surprising. Furthermore, the genetic apparatus in sexually breeding organisms, which is the object of study in Mendelian genetics, is itself a product of evolution. Future evolutionary changes may result in segregation being the special case or even disappearing, if other mechanisms prove more advantageous.

Defenders of the claim that there are laws in biology take a more local or conditional perspective on the nature of laws. Within the time span of genetic experiments, Mendel’s laws support predictions about the ratios of characters expected in hybrid crosses (see Laws, natural §1).

4 Reduction and theory change in genetics

Philosophers have debated whether the relation between Mendelian and molecular genetics is one of theory reduction. Theory reduction, in the sense proposed by the logical empiricists, requires that theories be in axiomatic form, such that the reduced theory can be deductively derived from the reducing theory. Furthermore, any term in the reduced theory not also in the reducing theory must be connected to a term in the reducing theory by a ‘reduction function’. Severe complications arise when trying to connect the Mendelian gene, characterized in terms of effects upon one or many phenotypic characters, and the molecular gene, which may code for a single protein that has myriad effects upon numerous biosynthetic pathways. Furthermore, although some possibility exists for putting Mendel’s laws of segregation and independent assortment into an axiomatic form, no ‘laws of molecular biology’ seem identifiable. No deduction seems possible.

The debate about derivational theory reduction arose within the context of the logical empiricist approach to philosophy of science (see Logical positivism §4; Unity of science). Alternatives to reduction have arisen within the context of the study of theory change, rather than the analysis of logical relations between static, axiomatically characterized, atemporal theories. From this historical perspective, one view is that Mendelian genetics was replaced by molecular genetics. Another view is that molecular genetics is the later development of the research programme begun by Mendelian genetics. In this latter alternative, Mendelian segregation, for example, is viewed as being explained at the level of the chromosome. Pairs of chromosomes separate in the formation of germ cells and this explains why genes, carried by the chromosomes, segregate. However, the problems of gene reproduction and gene function were not solved at the chromosomal level. Their solution required the level of the macromolecule. Molecular genetics thus solved problems posed by, but not solvable by, Mendelian genetics and the chromosome theory (see Reduction, problems of).

5 The gene as the unit of selection

Philosophers of biology, as well as evolutionary biologists, have debated the appropriate unit for evolutionary theory. Dawkins (1982) proposed that ‘selfish’ genes construct extended phenotypes to increase their chances of survival in future generations. Extended phenotypes include not only the hereditary characters of typical Mendelian phenotypes, but also any behaviour under genetic control, such as the building of dams by beavers. The genes are the replicators and the important units of selection; the extended phenotypes are vehicles for carrying the genes. Others have objected that the phenotype is the unit that interacts with the environment and hence the phenotype (the interactor) is the more important unit in selection. Other critics of genic selection argue that attempting to reduce the theory of evolution to an account of changes in individual genes produces artifacts, because the individual genes are usually parts of gene complexes that produce phenotype characters in complex ways. Also, the selective advantage of a gene may be dependent on its relative frequency in a gene pool; thus, say critics of genic selection, the genetic context is relevant to the selective advantage of a given gene. Reducing evolutionary theory to the level of the single gene may be too low a level for an adequate theory. Defenders of genic selectionism disagree.

There is another problem with characterizing the units of selection theory as the replicator and the interactor - it neglects the essential role of genetic variation in producing the raw material on which selection acts. Selection type theories are characterized by genetic variation, then interaction, which causes a benefit to accrue to some of the

variants, a benefit which may include genetic replication (see Evolution, theory of §3).

6 Genetic determinism and sociobiology

The issue of the role of genes in determining human traits has occasioned much debate. Human sociobiology raises new questions for the old nature-nurture debate about the role of genes in determining human social behaviour and the past evolutionary advantage of such hypothetical genes (see Sociobiology). The fallacy of genetic fatalism is the erroneous assumption that possession of a gene infallibly leads to a single phenotypic expression of the genetic trait. Different phenotypic responses are possible, given the genetic context and environmental variables that play a role in the expression of a trait.

Genetics and ethics

The identification of human genes poses problems about the use of resources, and about ownership and use of genetic information, and could lead to overemphasis of the importance of genetic make-up. Genetic screening raises problems of consent, stigmatization, discrimination and public anxiety. Counselling will be required, but whether this can facilitate individual choice is unclear. It will also involve problems of confidentiality. On the other hand genetic knowledge will pave the way for genetic therapies for hereditary disease. This raises the question whether a therapy which alters an individual at the genetic level is different in kind from conventional medical treatment. Genetic alterations passed on to future generations raise problems regarding consent. Genetic intervention could also be used to make 'improvements' in human genetic potential, leading to anxieties about eugenic attempts to design the species. Transgenics, the introduction of foreign genes into a genome, raises questions about the integrity of species boundaries and the assessment of risk.

1 Genetic screening, determinism and discrimination

It is with regard to the medical implications of genetic research that most ethical issues arise. The first concerns genetic screening. There is a distinction between screening and testing, although similar ethical issues arise in both cases: whereas testing applies to the analysis of the genetic make-up of individuals, to establish whether they carry a certain gene, screening determines the prevalence of a gene in a particular population. Different kinds of screening can be distinguished. (1) Neonatal screening, such as that used for phenylketonuria, which is primarily for identifying those suffering from diseases that can be ameliorated by early treatment. (2) Screening or testing in childhood, which will facilitate both the detection of those predisposed to develop late-onset diseases, and the identification of carrier status prior to reproductive age. There are particular problems here with consent, possible stigmatization, and the disclosure of information to the child. (3) Pre-conception screening of adults, which may increase the possibilities of informed reproductive choice. (4) Prenatal screening, which will have particular relevance for assessing the status of the foetus, with the associated ethical dilemmas concerning abortion (see Reproduction and ethics).

Screening of adults will increasingly have implications beyond reproductive choice. Whereas in the past, screening tended to be targeted at individuals known to be at risk, greater genetic knowledge will facilitate the screening of whole populations, given available resources. It may become possible to do 'broad spectrum' screening of individuals for a wide range of conditions, with the associated likelihood of increased public anxiety arising from changes in self-image following testing, and the danger of stigmatization.

Three categories of ethical issue arise. What criteria should be satisfied before the introduction of a particular screening programme? In accordance with what principles should a screening programme be carried out? What are the criteria for success - how should it be evaluated afterwards? This may involve follow-up of individuals screened, for example, with problems of privacy and confidentiality.

Genetic screening could lead to new forms of discrimination on the basis of a person's genetic make-up, irrespective of symptoms. The implementation of sickle-cell screening in the USA led to stigmatization of carriers, despite the fact that they did not have sickle-cell disease. Further worry surrounds the use of screening and testing to identify people who have a genetic predisposition to develop a disease in later life which has a genetic component, but which may require some environmental component to trigger it. If it were possible to identify which individuals were at increased risk, because of their genetic make-up, of succumbing to cancer caused by a particular toxin in the workplace, such individuals might find themselves unemployable or uninsurable. There is a question concerning what information about genetic predispositions ought to be made available to employers and insurers, and a conceptual question about what counts as a predisposition: there is a danger that the distinction between 'predisposed' and 'predetermined' might become blurred.

Arguments against genetic discrimination, or 'geneticism', are analogous to those opposing racism and sexism. There are worries, however, that greater genetic knowledge may lead to less tolerance of genetic disease, which may come to be seen as avoidable. A distinction has to be drawn, however, between the evaluation of a particular genetic condition and the value of the individual who suffers from it. Hence there are issues about choice of terminology. The choice between 'handicap', 'defect', 'disorder' and 'variant' is not ethically neutral.

2 Genetic counselling

Genetic screening programmes will increase the need for counselling. Genetic counselling is commonly understood to include the following elements: estimating the risk of having or propagating a genetic disorder; advising the counsellee at risk about the medical facts underlying the disorder; and facilitating and supporting a decision by the counsellee.

The first ethical dilemma concerns autonomy (see Autonomy, ethical). There is a question whether the very existence of genetic screening and counselling encourages pressure on individuals to make particular reproductive decisions. In line with the importance commonly given to autonomy, the prevailing model in genetic counselling has been ‘nondirective’. Counselling, in facilitating counsellee decision-making, is thus distinguished from advice. It has been suggested, however, that the very structure of the counselling interview undermines the possibility of nondirectiveness, and the fact that, for example, termination is an option may somehow suggest to clients that this is a choice they ought to make.

Informed consent is particularly problematic in genetic counselling, when variation in perceptions of risk is taken into account. To a couple being counselled about a one in four chance of giving birth to a child suffering from a recessive genetic condition, the numerical probability may be less meaningful than the nature of the condition itself. Furthermore, individuals’ perception of risk can be affected by the way in which information is presented. The introduction of population broad-spectrum screening will further complicate the issues. Informed consent will be yet more difficult when a number of diseases are at issue at the same time (see Consent).

The applicability of principles of medical ethics to genetic counselling is also complicated by the fact that the ‘client’ in this context is normally a couple or family rather than an individual. This raises the issue of confidentiality, relevant to both screening and counselling. The discovery of nonpaternity is an example of a dilemma that might arise. For example, genetic testing of a child and its parents may reveal that the male partner is not the genetic father of the child. Does he have a right to this information, or does the mother have a right to confidentiality?

The issue of confidentiality is linked with that of ownership, and the sense in which an individual can be said to own their genes. The fact that genetic relatives share genes has been advanced as a reason for questioning the individual’s right to confidentiality in some cases, where there is information that might affect the reproductive decisions of others.

3 Gene therapy

Genetic knowledge will facilitate gene therapy, which is controversial because it involves alteration of an individual at the genetic level. An analogy is frequently drawn, however, between gene therapy and organ transplants. Fears that genetic alteration would somehow interfere with the identity of the person are unrealistic in the light of proper understanding of what the techniques involve, and appreciation of the extent to which individuals can be affected by environmental techniques. Regarding the view that gene therapy should be seen in the same way as other forms of therapy, and similarly subject to requirements of informed consent, there are two complicating factors, however. One is the difference between somatic and germline gene therapy; the other is the potential use of gene therapy techniques for enhancement purposes.

Somatic gene therapy is the treatment of the body cells of an individual; the genetic alteration will not be passed on to descendants. Germline therapy, however, will involve changes that will affect subsequent generations. Many commentators see a moral difference between these two, suggesting that somatic, but not germline, therapy is acceptable. The arguments for this position are, first, that there is at present insufficient knowledge to justify taking risks that may be irrevocable (see Risk). If, for example, action were taken to eliminate a particular gene from the gene pool, we may discover too late that it had some hidden advantage and lose valuable genetic diversity. Second, whereas the individual undergoing somatic therapy has the opportunity to consent to or refuse therapy, those affected by germline therapy will be as yet unborn generations, who cannot express a choice in the matter. This raises the general ethical question whether we have obligations to future generations (see Future generations, obligations to). Third, there is an argument that individuals have a right to an unmodified genetic inheritance. In a more plausible form the argument claims a right to a genetic inheritance that has not been

tampered with except to remove pathology. Here it slides into the therapy/enhancement distinction.

A further problem associated with germline therapy concerns the means of carrying it out. It must either target the germ cells of an adult or be carried out at the embryonic stage. Its development will therefore involve research on human embryos and the associated ethical dilemmas.

On the other hand, there are arguments in favour of a positive obligation to develop germline therapy. First, there is said to be a general obligation to relieve suffering where we can, in this case by seeking treatments for genetic disease. Second, there is an argument from scientific freedom, though this is largely connected with a view that classifies gene therapy as research. Third, there is an argument from reproductive autonomy. Germline therapy might be, for some couples, the only way they can achieve a ‘winning combination’ of genes. Even if this is not the case, if a woman can consent to somatic therapy on her child, why cannot she ensure that all her descendants should be free of a condition such as Huntington’s chorea?

The debate over the distinction between gene therapy and genetic enhancement raises the question of what the goals of medicine should be. If medical technology is not limited to therapeutic interventions elsewhere, it is difficult to see the argument for limiting it in the genetic sphere alone: particular uses would have to be considered on their individual merits. An example to illustrate the distinction is the use of growth hormone to treat dwarfism, on the one hand, and to produce talented basketball players, on the other.

4 Eugenics and transgenics

Underlying many of the objections to genetic screening, genetic counselling with the option of termination of affected foetuses, and gene therapy, is an anxiety about eugenics, the attempt to improve the human gene pool. This arises because of historical precedents which show the potential for abuse. It is also one factor in the drive towards the upholding of nondirectiveness in counselling. The question arises as to the extent to which it is possible to advocate steps to improve genetic public health without the associations of discredited genetic eugenic policies. If public health is a good that should be pursued, then, *a fortiori*, genetic public health is a good that should be pursued. A distinction has commonly been drawn between negative and positive eugenics, negative being the attempt to reduce the frequency of genetic disease and positive the attempt to improve such qualities as intelligence or moral sensitivity. Some take the view that all eugenics is unacceptable; some that negative eugenics is morally acceptable, but not positive; others that both, under certain conditions, are acceptable. There are conceptual problems about how the negative-positive distinction is to be drawn, and also problems about the arguments for a moral distinction. There are arguments about the greater moral urgency of relieving suffering, but also intuitive objections to ‘designer babies’, the basis of which is not always clear, but which rely partly on an appeal to human dignity, partly on an objection to ‘playing God’, and partly on an appeal to lack of sufficient knowledge.

Transgenics, the incorporation of foreign genes into the genome of an organism, is commonly discussed in connection with animals and plants. One issue concerns the rights of the host organism, particularly in cases where suffering is likely to ensue. A more fundamental question is whether there is anything wrong in principle in crossing species barriers. Supporters point out that cross-breeding is nothing new, and that the definition of species is itself problematic (see Species). Opponents may fall back on arguments about what is natural to a certain form of life, or point to the risks of releasing genetically engineered organisms into the environment. In addition to the interests of the modified organisms themselves, there are consequences for human health, for other species, and for the biosphere to be considered. There is a question, first, as to what constitutes ‘release’, and, second, as to whether risk-assessment exhausts the moral issues.

5 The human genome project

The attempt to map and sequence the entire human genome raises ethical questions about whether that attempt is worthwhile. Large parts of the genome, for example, are referred to as ‘junk DNA’ - are they worth sequencing? The project is defended on the grounds that knowledge is worthwhile in itself: junk DNA may have functions we are as yet unaware of, and the mapping of the human genome will give us insight into the nature of humanity. The latter point is attacked as an overly reductionist view of human beings which ignores spiritual and environmental factors (see Human nature §2).

A second problem concerns ownership and exploitation of results of human genome analysis: whether, for example, it is permissible to patent human genetic sequences, and how the benefits of the knowledge gained will be distributed, given that there is a sense in which the genome belongs to the whole of humanity (see Responsibilities of scientists and intellectuals §3). These issues have been given added urgency by the result of a recent genetic experiment: the succesful cloning of a sheep. Nicknamed ‘Dolly’, the cloned sheep was produced by isolating a segment of DNA from another sheep and replicating it in a laboratory. It has been admitted by the scientists who performed the experiment that the same process could be applied to humans.

Because of their revolutionary and far-reaching potential, and because the fact of genetic relatedness poses particular problems for an individualistic ethic, advances in genetics have provoked discussion about the appropriate ethical framework to apply: whether there is any categorical objection to genetic interventions or whether some form of consequentialist analysis is adequate (see Consequentialism; Deontological ethics); whether established principles of medical ethics are applicable or whether an ethics of care based on feminist thought is preferable (see Medical ethics; Feminist ethics).

Gentile, Giovanni (1875-1944)

Best known as the self-styled philosopher of Fascism, Gentile, along with Benedetto Croce, was responsible for the ascendance of Hegelian idealism in Italy during the first half of the twentieth century. His 'actual' idealism or 'actualism' was a radical attempt to integrate our consciousness of experience with its creation in the 'pure act of thought', thereby abolishing the distinction between theory and practice. He held an extreme subjectivist version of idealism, and rejected both empirical and transcendental arguments as forms of 'realism' that posited the existence of a reality outside thought.

His thesis developed through a radicalization of Hegel's critique of Kant that drew on the work of the nineteenth-century Neapolitan Hegelian Bertrando Spaventa. He argued that it represented both the natural conclusion of the whole tradition of Western philosophy, and had a basis in the concrete experience of each individual. He illustrated these arguments in detailed writings on the history of Italian philosophy and the philosophy of education respectively. He joined the Fascist Party in 1923 and thereafter placed his philosophy at the service of the regime. He contended that Fascism was best understood in terms of his reworking of the Hegelian idea of the ethical state, a view that occasionally proved useful for ideological purposes but which had little practical influence.

1 Life and works

Giovanni Gentile was born on 30 May 1875 at Castelvetrano in Sicily. He studied philosophy at the University of Pisa under Donato Jaja, a pupil of Bertrando Spaventa. Spaventa's ideas were also to have a profound impact on Gentile's thought. He graduated in 1897 with a thesis on the nineteenth-century Italian philosophers Rosmini and Gioberti, through whom he explored Kant and Hegel respectively. He later claimed that the germs of his mature philosophy were already present in this early attempt to pursue the Hegelian critique of Kant. This study was published in 1898 and was followed the next year by a critical examination of the writings of Karl Marx, *La filosofia di Marx: Studi critici (The Philosophy of Marx: Critical Studies)*, which took this project further. In this work he offered one of the earliest Hegelian readings of Marxism. Although he maintained that Marx's materialism involved an unsuperseded dualism between mind and matter, he shared his belief in the unity of thought and practice. He translated Marx's *Theses on Feuerbach* into Italian for the first time, using them to assimilate the Marxian doctrine of praxis to Vico's notion that we can only know what we have made. His own doctrine largely grew out of a radicalization of this thesis: namely, that we make the world through thought.

Gentile's friendship with Croce began during this period (see Croce, B. §§1, 4). Their collaboration on the latter's journal *La critica* was to have a profound impact on Italian cultural life. Together they attacked the dominant positivist tradition and worked for a revival of the idealist tradition of the Neapolitan Hegelians. In pursuance of this goal, Gentile contributed a series of detailed historical studies of Italian philosophy in the eighteenth and nineteenth centuries to *La critica*, and republished the works of Spaventa.

Gentile first developed his own theory through writings on the philosophy of education, beginning with his essay 'Il concetto scientifico della pedagogia' (The Scientific Concept of Education) (1901) and culminating in his two-volume *Sommario di pedagogia come scienza filosofica (Summary of the Philosophy of Education)* (1913-14). He became a *Privatdozent* at Naples in 1903, but only secured a permanent post in 1906, when he became professor of philosophy at the university of Palermo. He began to work out his theory in earnest, publishing an important article in 1912, 'L'atto di pensare come atto puro' (The Act of Thought as Pure Act), and a series of essays in 1913, *La riforma della dialettica hegeliana (The Reform of the Hegelian Dialectic)*. Up until this time, his relationship with Croce had been one of friendly and creative disagreement. Indeed, he could claim to have had an important influence on Croce, moving him in a more markedly historicist direction. Croce, however, now accused him of advocating either emotivism or a mystical spiritualism, while Gentile countered that his friend remained at heart a naturalist. Their disagreements, hitherto confined to private correspondence, went public in 1913 in a famous debate in the journal *La voce*. It marked the first step to their eventual dramatic split.

In 1914, Gentile succeeded to Jaja's chair at Pisa, where he wrote his major work, the *Teoria generale della spirito come atto puro (The Theory of Mind as Pure Act)* (1916). In 1917 he moved to Rome, where he completed the systematic exposition of his thesis with his two-volume *Sistema di logica come teoria del conoscere (System of*

Logic as Theory of Knowing) (1917, 1923). In 1920 he started up the *Giornale di filosofia italiana (Journal of Italian Philosophy)* as an organ for his students, although he continued to write for *La critica*.

In 1922 Gentile entered Mussolini's first cabinet as Minister of Education, instituting *La riforma Gentile*, a comprehensive overhaul of the secondary education system. In 1923 he joined the Fascist Party and thereafter became the self-styled philosopher of Fascism - a move that precipitated the final break with Croce, who remained a confirmed liberal. From 1924 he was director of the National Fascist Institute of Culture. He also acted as editorial director of the *Enciclopedia italiana* from its inception in 1925 to its completion in 1937. The only books of philosophical note from this period were his *Filosofia dell'arte (The Philosophy of Art)* (1931), which criticizes Croce's aesthetics, and *Genesi e struttura della società (Genesis and Structure of Society)* (1946), which offers the fullest account of his social and political philosophy. This last was written following the outbreak of civil war in Italy and was published posthumously. Gentile had joined the last ditchers in the German puppet Fascist Social Republic of Salò, and was assassinated by communist partisans in Florence on 15 April 1944.

2 Actualism

Gentile sought to elaborate a theory of knowledge that rejected all presuppositions of either a transcendent or an empirical reality lying outside human consciousness. Following Hegel, Gentile believed that by positing a fixed noumenal world as the transcendental ground of phenomenal experience Kant denied the truly creative faculty of the Understanding (see Kant, I. §5). Hegel's criticism did not go far enough for Gentile, however. Hegel did not wish to replace transcendental with subjectivist idealism. The contribution of the thinking subject was vital, but this did not mean that all knowledge was relative to the knower. Hegel's epistemology was underwritten by an ontological argument, which regarded being and consciousness as logically related as part of the development of a metaphysical entity - Spirit or Mind - immanent to them both (see Hegel, G.W.F. §3). Gentile argued that this solution remained unsatisfactory because the Hegelian Spirit was as transcendent from the human viewpoint as the Kantian categories. He believed the Hegelian distinction between *Phenomenology*, or the development of individual consciousness, and *Logic*, which regarded reality as the product of Spirit, created an apparent dualism between Spirit as the essence of everything and human thought. Drawing on Spaventa, Gentile sought to overcome this alleged Hegelian dualism by identifying the individual mind of the *Phenomenology* with the Spirit of the *Logic*. Transcendence was finally overcome in a philosophy of absolute immanence, in which the activity of the thinking subject was the sole basis for human knowledge and hence of the objects that constituted human experience.

Gentile, via Hegel and Spaventa, concluded by transferring to thought *tout court* the faculties originally ascribed by Kant to the transcendental subject and by Hegel to Spirit. The method of immanence, he contended, rendered thought a 'pure act' that is presuppositionless, the absolute foundation of the human world of experience. Sensation, on this theory, is misconstrued as a response to an object external to the subject. Rather, it represents an act of self-awareness on the part of the thinking subject through which the external world is internally comprehended as part of a process of self-constitution (*autoctisi*).

There is a clear danger that Gentile's theory risks degenerating into solipsism. He attempted to avoid this pitfall through a theory of language that in a number of respects anticipates the arguments of Wittgenstein. Language, Gentile argued, is the embodiment of thought through which we organize experience. It is the form and not simply the vehicle of consciousness. However, there can be no purely personal or private language (see Private language argument §§1-2; Wittgenstein, L.J.J. §13). The very concept of language entails a spiritual universe comprised of a system of meanings that are essentially public and communicable. Consequently, all thought implied the existence of an 'other' with whom we entered into dialogue within our own consciousness. The search for self-knowledge, and in the process truth, involved the aspiration to membership of an ideal community speaking a shared universal language.

Gentile provided two proofs of his 'theory of spirit as pure act'. First, he claimed it was the logical outcome of the rationalist enterprise of modern philosophy since Descartes and, borrowing from Hegel, the essence of Christianity. He adopted Spaventa's theory of the 'circulation of European thought' to illustrate this thesis in order to show how the ideas of the German philosophers he admired were adopted, or independently conceived, by Italian thinkers as part of a single philosophical tradition. Second, he maintained that the theory reflected the phenomenological development of human consciousness within the individual. This argument provided the main

theme of his writings on education and influenced his practical proposals for changes in the school curriculum, which gave pride of place to languages and philosophy and treated history and the natural sciences as preliminary stages of human understanding.

3 Social and political philosophy

Gentile's 'actual idealism' entailed the unity of theory and practice. Thinking and acting formed part of the same activity of self-constitution, whereby experience involved thought simultaneously comprehending and transforming the world. Drawing on Marx and Vico, Gentile elaborated an idealist theory of praxis whereby thought creates the world of fact through the transformation of nature - a process he termed the 'humanization of labour'. Actualism was the only philosophy compatible with human autonomy. It brought moral freedom back to earth from the noumenal world where Kant placed it, to become part of our everyday economic and political activity for which we were totally responsible. As he put it in a famous speech in support of the Fascist *squadristi*, it is impossible

> 'to distinguish moral force from material force …. Every force is a moral force, for it is always an expression of will, and whatever method of argument it uses - from sermon to cudgel - its efficacy cannot be other than that of entreating the inner man and persuading him to agree.'
>
> (1925: 50-1)

Just as his subjectivist idealism risks solipsism at the level of theory, so it appears to endorse a Hobbes-like 'war of all against all', in which might is right, at the level of practice. Once again, Gentile's solution to this dilemma was to argue that action, like consciousness, presupposed interaction with a community of values. Drawing on both the Hegelian conception of the state as the rational expression of the ethical life of the nation and Giuseppe Mazzini's theory of nationalism as the spiritual expression of 'God and People', he argued that each individual came to appreciate how their self-realization was intimately bound up with those of their fellows through social institutions that embodied shared cultural traditions and were oriented towards the common good. His defence of Fascism was largely in these terms, although this involved a considerable blindness to the difference between official doctrine and the practical reality. He coined the term totalitarianism to signify his ideal of the ethical state as the unity of the whole nation's thought and action. However, the Fascist corporatist state he idealized as the mechanism for bringing this unification about never had more than a merely formal existence.

The central difficulty of Gentile's thought lies in his attempt to reconcile an extreme subjectivism with a universalist theory of meaning and a collectivist conception of the state. Arguably the clearest account of his position comes in Chapter 4 of the posthumously published *Genesis and Structure of Society* on 'Transcendental Society or Society *in interiore homine*'. Gentile insisted that our consciousness of society and the community of meaning comes not from our actual interaction with other people but is generated within ourselves and the reflection of individuals upon themselves. Society and even language originates from within the individual (*in interiore homine*), not between individuals (*inter homines*), a view Gentile condemned as atomistic. The temptation to slip from this position into the assumption of an undifferentiated identity among individuals is all too easy, however, as Gentile's connivance with a highly repressive and authoritarian regime amply testifies.

Gentzen, Gerhard Karl Erich (1909-45)

The German mathematician and logician Gerhard Gentzen devoted his life to proving the consistency of arithmetic and analysis. His work should be seen as contributing to the post-Gödelian development of Hilbert's programme. In this connection he developed several logical calculi. The main device used in his proofs was a theorem in which he proved the eliminability of the inference known as 'cut' from a variety of different kinds of proofs. This 'cut-elimination theorem' yields the consistency of both classical and intuitionistic logic, and the consistency of arithmetic without complete induction. His later work was aimed at providing consistency proofs for less restricted systems of arithmetic and analysis.

Gerhard Gentzen studied mathematics at Greifswald, where he was born, Göttingen, Munich and Berlin. In 1933 he obtained his doctoral degree at Göttingen under the supervision of Hermann Weyl and then from 1935 to 1943 he carried out research as an assistant to David Hilbert. Gentzen was conscripted in 1939 and then released from military service in 1942 after having become seriously ill. On his release, he took up a post at the University of Göttingen, where he had completed his post-doctoral thesis in 1940, moving to the German university in Prague in 1943. Gentzen was imprisoned by the Czech authorities in May 1945 because of his membership of National Socialist organizations. Three months later he died of malnutrition.

Gentzen was one of the most important contributors to Hilbert's programme of founding classical mathematics via finitary consistency proofs (see Hilbert's programme and formalism). For this purpose he developed several logical calculi building on earlier work on logical deduction by the Göttingen physicist Paul Hertz (see Gentzen 1933). Gentzen's main idea, already present in his doctoral dissertation, 'Untersuchungen über das logische Schließen' ('Investigations into Logical Deduction'), was to replace Hilbert-style calculi, in which theorems are deduced from axioms, by 'calculi of natural deduction' which start not with axioms but with sets of formulas considered as assumptions (see Natural deduction, tableau and sequent systems). The general form of an inference figure in such calculi is

$$\frac{A_1 \ldots A_\nu}{B} \quad (\nu \geq 1),$$

where $A_1, \ldots, A_\nu, B$ are formulas, and where the 'lower formula' *B* is deduced from the 'upper formulas' $A_1, \ldots, A_\nu$. Propositional connectives and quantifiers are defined by rules governing their introduction and elimination in proofs, and theorems are derived tree-style beginning with certain initial formulas treated as (possibly hypothetical) 'assumptions'. The idea was that such a procedure would be more like our 'natural' way of reasoning in mathematics than are the procedures of a Hilbert-style system. The resulting intuitionist calculus (NJ) can be extended into a complete classical calculus (NK) by simply admitting additional assumption formulas, for example, in the case of propositional logic, sentences of the form $A \vee \neg A$.

In order to avoid assumption formulas, Gentzen suggested intuitionist and classical 'sequent calculi' (LJ and LK, respectively). A metalogical sequent of the type $A_1, \ldots, A_\nu \vdash B_1, \ldots, B_\mu$ can be read as an abbreviation of the logical formula $A_1 \wedge \ldots \wedge A_\nu \supset B_1 \vee \ldots \vee B_\mu$. Sequents can be arranged in derivations with initial sequents of the unconditional form $D \vdash D$. Besides the operational rules for introduction and elimination of particular operators, Gentzen introduced structural rules (so-called 'inference figure schemes'). They include 'thinning', which allows the introduction of extra formulas in antecedents, 'contraction' of formulas stated more than once, 'interchange' of formulas in antecedents and consequents, and the important 'cut' rule

$$\frac{\Sigma \vdash A \quad \Sigma, A \vdash B}{\Sigma \vdash B},$$

with Σ an arbitrary set of formulas. Gentzen's cut-elimination theorem ('*Hauptsatz*') says that every derivation in LJ or LK can be transformed into a derivation with the same end sequent in which the cut rule is not used. The *Hauptsatz* can be used to prove the consistency of classical and intuitionist predicate logic. Gentzen also used it to solve the decision problem for intuitionistic propositional logic and to give a new proof that the law of excluded middle cannot be derived in formalized intuitionistic logic.

Using a sharpened form of the cut-elimination theorem (commonly referred to as the Gentzen-Herbrand theorem) and the subformula property (stating that all formulas occurring in the course of a derivation in the sequent

calculus without cuts are subformulas of the formulas in the end sequent), Gentzen succeeded in proving the consistency of arithmetic without complete induction. However, he saw this as only a first step, since, as he noted, arithmetic without induction is of only little practical significance in number theory (1969: 115). In approaching the project of finding consistency proofs for less restricted systems of arithmetic and analysis Gentzen had to face Gödel’s result that the consistency of a formalized theory embracing arithmetic cannot be proved using only means formalizable in this theory. For Gentzen, this did not yield the impossibility of consistency proofs for such theories. He admitted a ‘restricted transfinite induction’ up to Cantor’s first epsilon number ε_0 (the limit of $\omega, \omega^{\omega}, \omega^{\omega^{\omega}}, \ldots$), which cannot be formalized in classical arithmetic, which he nevertheless claimed could be interpreted constructively (1969: 231). Hence he regarded a consistency proof using ε_0-induction as a contribution to the realization of a liberalized Hilbert’s programme although the form of induction used goes beyond the finitary methods of proof as described by Hilbert.

In ‘Die Widerspruchsfreiheit der reinen Zahlentheorie’ (1936a), Gentzen offered a first proof of the consistency of classical arithmetic by arranging the proofs of classical number theory into an ordering of type ε_0 such that the consistency of a given proof in the sequence follows from that of its predecessors. This done, an application of ε_0-induction secures the proof of the consistency of the full family of proofs of classical arithmetic.

Gentzen provided new insights into the interrelationship between the intuitionist and formalist approaches to the philosophy of mathematics. He aimed at reconciling both positions with the help of a consistency proof which saved all of classical analysis by constructive techniques. The techniques he developed are now standard in proof theory.

Geology, philosophy of

In the mid-1960s, geology underwent a conceptual revolution. Prior to that time, most geologists believed that the continents and oceans were fixed and permanent, the basic features of the earth's crust. Subsequently they came to agree that the earth was covered by rigid plates, thin in relation to the earth's diameter, in which the continents were embedded like logs in icebergs. It was the creation, movement and destruction of these plates that were responsible for the mid-ocean ridges, the areas of mountain building and earthquake activity, and the deep ocean trenches.

This conceptual revolution also marks a shift in the philosophy of geology. From the early nineteenth century, the chief philosophical question posed by geology was whether a historical science encountered special epistemic problems, a question that was usually answered by invoking the principle of uniformitarianism. In its strict form this stated that the only kind and intensities of causes that could be used to explain past geological phenomena were those that could be directly observed. Many sloppier formulations were invoked under the same name. Since the revolution, philosophers have turned to geology chiefly to use the revolution to exemplify or challenge one or another theory of scientific change.

1 Geology as a historical science: uniformitarianism

Early in the nineteenth century, geologists, who had previously concerned themselves primarily with the location and chemistry of economically valuable ores, began instead to concentrate on unravelling the earth's history. For the next century-and-a-half, the major issue in philosophy of geology was what it was to be a historical science. Most of the hard thinking about this was done by geologists, not philosophers.

Often cited in this regard is James Hutton, the late-eighteenth-century Scottish geologist and natural philosopher, who coined the phrase that the processes of geology showed 'no vestige of a beginning, no prospect of an end'. But in fact the major analysis of geology as a historical science was advanced by Charles Lyell, the British geologist, in his three-volume *Principles of Geology* (1830-3). Although Lyell himself did not call this analysis uniformitarianism, the Victorian philosopher-scientist William Whewell dubbed it so in the *Quarterly Review* in 1832. What Lyell had suggested was: one, that the laws of nature have not changed over time (law uniformitarianism); two, that the kinds of cause operating have not changed over time (kind uniformitarianism); and three, that the intensity of those causes has not changed over time either (degree uniformitarianism).

Law uniformitarianism was an uncontroversial position in the early nineteenth century. Geologists agreed that the laws of nature had neither changed nor been suspended. With the possible exception of the introduction of new animal and plant species, miracles were no longer part of the geological repertoire. Even in the case of new species, their possibly miraculous creation did not signify a change of natural law but an exception to it. Lyell himself dealt with this by having new species created in a law-like manner.

Kind and degree uniformitarianism, by contrast, were controversial. It seems plausible to believe that Lyell had taken these positions as a result of adapting a well-known methodological principle to geology, the principle of true causes (or vera causa principle) laid down by Newton in the Rules of Reasoning in the *Principia mathematica* (1687). This stated that the scientist should 'admit no more causes of natural things than such as are both true and sufficient to explain their appearances'. Newton's prestige was such that, during the eighteenth century, many different glosses were placed on the method of true causes (see Scientific method §2). It seems likely that Lyell took his particular interpretation from the Scottish philosopher Thomas Reid (1710-96), who argued in his *Essays on the Intellectual Powers of Man* (1785) that the vera causa principle meant that: one, there must be direct observational evidence that causes of the kind assumed do exist, and two, there must be evidence that the causes were sufficient to produce the purported effects.

As Lyell saw it, the problem for the geologist who attempted to interpret the past was the lack of direct observational access to past causes. The only causes that could be readily observed were those acting at present. Therefore the geologist who attempted to follow the method of true causes was in general limited to causes of a kind that operate at present. Equally, in conjecturing about the unknown effects of some observed cause, geologists must confine themselves in a similar way. In short, kind and degree uniformitarianism can be seen as a

straightforward extension of the principle of true causes to situations in which cause and effect are widely separated in time.

Geologists' attempts to reconstruct the past, therefore, posed a special case of an epistemic problem central to the other sciences: how to go from the known to the unknown, from the observable to the unobservable. But whereas for physicists this jump was generally from the macro-world to the micro, for geologists it was from the present to the past. Even if geology were an historical science, its epistemic problems could be tackled by a suitable modification of methodological principles already established in the other sciences.

Lyell put his principle of uniformitarianism to good effect in constructing his system of geology. He was unhappy with the common belief that the earth had once been molten and that its temperature was declining. Such a theory did not meet his vera causa criterion for there was no direct observational access to the original state of the globe. There was, however, evidence (fossilized tropical plants, for example) that the temperature of the northern hemisphere had been lower in the past. To explain this, Lyell proposed an alternative. At present, the earth's temperature at a given spot depends not solely on latitude but also on the distribution of land and sea, continental climates being very different from oceanic ones. Distribution of land and sea is thus a vera causa of climate. If the distribution of continents and islands had been different in the past, then the temperature in the northern hemisphere could have been warmer even though the average temperature of the globe remained the same.

Lyellian uniformitarianism won certain influential adherents in the nineteenth century, among them the astronomer and philosopher of science John Herschel, the mathematician Charles Babbage, and the natural historian Charles Darwin. Indeed, all three, realizing that the success of Lyell's vera causa theory of climate depended on a prior vera causa theory of the elevation and depression of land masses, attempted to identify a 'true cause' for land elevation, something that Lyell had not succeeded in doing in the *Principles*.

Most geologists, though, were sceptical. To them, it appeared quite possible that certain causes now in operation (ice, for example) might not have existed in the past (if the globe had been warmer, for example). To almost all geologists, the suggestion that causes had never varied in intensity was little short of perverse. Consequently most subscribed to the rival position, termed catastrophism by Whewell, which admitted the possibility of past causes different in kind and in intensity from those currently operating. Catastrophism in this strict sense was not tantamount to asserting that all geological effects were to be explained by sudden and dramatic changes and certainly not to the assertion that the laws of nature had changed over time.

In the twentieth century, for reasons that are not entirely clear, it became geological orthodoxy to invoke uniformitarianism, though by now much of the force of Lyell's original thesis had been lost. The term was frequently used to mean 'actualism' - that the past should be interpreted in terms of present causes. Lyell himself had never simplistically equated the 'present' and the 'known'. For him, the core dichotomy was between the observable and the unobservable, not between the present and the past. While most observable causes were present causes, sometimes we had access to past causes from the written records of antiquity. For example, on the basis of historical records of volcanic activity, Lyell was quite prepared to argue that the places where volcanoes would erupt in the future would vary just as they had varied in the past.

Uniformitarianism was also confused with 'gradualism', the belief that all geological processes had acted slowly and gradually, again something that Lyell never claimed. For him, the question of the pace of geological processes was simply a matter of what was observed. If there was observational evidence of meteor impact or of large-scale floods, then such agencies could be invoked in the past.

In the 1980s and 1990s, catastrophism (understood as anti-gradualism) became newly fashionable as geologists came to understand the effect of sudden and dramatic changes on the earth's surface. The detailed investigation of mass extinctions and the debate about whether these could be explained by meteor impact contributed to this (see Evolution, theory of §3). (Lyell would have been quite happy to accept our current evidence of meteor impact as adequate to establish meteors as a vera causa of geological change.)

Meanwhile, throughout the first half of the twentieth century, professional philosophers remained silent about the problems of geology. When they did speak, it was to say that, since geology dealt with the past, its laws must perforce be supplied by physics and chemistry. Hence, once the philosophical problems of physics and chemistry had been solved, solutions to the problems of geology would follow without further ado.

2 Scientific change and the plate tectonic revolution

During the 1960s, geology underwent a sudden and dramatic theoretical revolution. According to the new plate tectonic theory, the earth is covered by a limited number of rigid plates, thin in relation to the diameter of the earth, created at mid-ocean ridges (actually large mountain chains), spreading out from those ridges to be consumed again in subduction zones. Other phenomena - mountain building, earthquake activity, gravity anomalies, and so on - are explained in relation to the movement and intersection of these plates.

The revolution changed the emphasis of geology once more; reconstructing the earth’s past declined in importance and understanding the causal processes going on at present became the major focus of attention. These causes, while in principle compatible with those invoked by physicists and chemists, were in practice of a different order, including creation of new land at mid-ocean ridges, mountain building where one plate overrode another, destruction of land in subduction zones, and possible convection currents in the earth’s interior. Nonetheless, neither geologists nor philosophers have worried overtly about the philosophical foundations of the entities and processes asserted in plate tectonic theory. Instead the attention has gone to the plate tectonic revolution as a case of scientific change.

The plate tectonic revolution disturbed geologists deeply: within a matter of a few years, their most basic ideas about the structure of the earth were overturned. Equally important, their implicit philosophy of science simply gave no warrant for such a change. Ultimately derived from positivism, geologists’ image of science suggested that it progressed by a simple confrontation of hypothesis and evidence so that gradually and cumulatively a body of well-founded conclusions was established (see Logical positivism §4).

Casting around for some interpretation of science that would make sense of this event, geologists involved in the revolution quickly lit upon Thomas Kuhn’s *Structure of Scientific Revolutions*, serendipitously published just a few years previously in 1962. This gave licence for the possibility of revolutionary change in the most basic postulates of a science (see Kuhn, T.S.).

Philosophers of science, while agreeing that the changes were indeed dramatic, have been less inclined to treat the revolution as specifically Kuhnian. They have denied both that pre-plate tectonic geology was immature and that it fitted Kuhn’s description of normal science. They have questioned whether geological methods and aims changed concurrently with theory. They have dismissed the idea that pre-plate tectonic geology and plate tectonics were incommensurable (see Incommensurability).

But while being unconvinced that the geological revolution could be characterized as Kuhnian, they have agreed with geologists that this dramatic theoretical change does pose a challenge to the methodologies of science proposed by positivists. There is now a substantial and growing literature that seeks to interpret these changes in light of different methodologies.

Geometry, philosophical issues in

The least abstract form of mathematics, geometry has, from the earliest Hellenic times, been accorded a curious position straddling empirical and exact science. Its standing as an empirical and approximate science stems from the practical pursuits of land surveying and measuring, from the prominence of visual aids (figures and constructions) in geometric proofs and, in the twentieth century, from Einstein's General Theory of Relativity, which holds that the geometry of spacetime is dependent upon physical quantities. On the other hand, very early on, the symmetry and perfect regularity of certain geometric figures were taken as representative of a higher knowledge than that afforded by sense experience. And its concern with figures and constructions, rather than with number and calculation, rendered geometry amenable to axiomatic formulation and syllogistic deduction, establishing a paradigm of demonstrative knowledge which endured for two millennia. While the progress of mathematics has surmounted traditional distinctions between geometry and the mathematics of number, leaving only a heuristic role for geometric intuition, geometric thinking remains a vital component of mathematical cognition.

1 The idea of a demonstrative science

The earliest records of activity in geometry come from Babylon. What we know as Pythagoras' theorem appears in cuneiform texts of around 2600 BC, where it is given an empirical and approximate verification. As the name indicates, the subject of geometry originated in the practical pursuits of land measurement and surveying (though probably not first among the Egyptians, as Herodotus famously reports). Although the Greeks did not originate geometry, it is to them that we owe the conception of geometry as an exact demonstrative science as against an empirical and practical discipline. While anecdotal evidence identifies Thales of Miletus as the originator of the idea that geometric statements are to be proved, it is generally accepted that the Pythagoreans had transformed mathematics into a deductive science by around 500 BC. Pythagoras himself is said to have conferred upon geometry the standing of *theōria*, the manner of contemplative knowledge alone worthy of a free and not a slave people; and to have propounded the belief that its true subject matter pertained to intelligible objects rather than to sense experience. Later, in Plato, geometric figures - circles, triangles, the regular solids - became archetypal ideal forms: perfect, universal, absolute, eternal and harmonious; whereas their sensible instantiations in matter were seen as inexact, particular, relative, temporal and discordant (see Pythagoreanism §2).

Early Pythagorean methods of proof had probably not advanced much beyond primitive diagrammatic methods. By arranging pebbles in simple geometric arrays, a number of elementary theorems had been discovered by direct observation. Other visual methods included superposition, whereby the identity or congruence of two geometric figures was established by moving one figure into point-for-point coincidence with another. Some have conjectured that the first Greek proofs of the Pythagorean theorem were discovered in this manner. While such methods were suitable to the discovery of simple arithmetic and geometric facts, they were not as conclusive as the deductive methods canonically compiled in Euclid's *Elements of Geometry* (*c*.300 bc). Through its influence, the idea of a demonstrative science was established and geometry became the paradigm of systematic presentation of a body of knowledge in terms of logical deductions from axioms, whose truth was antecedently recognized.

At the basis of geometry, Euclid distinguished axioms, postulates and definitions. Euclid calls axioms 'common notions' which, as the starting points of demonstration, are held to be immediately evident, non-demonstrable truths or 'intelligible principles' deniable only on pain of absurdity. In this, he followed Aristotle rather than Plato, for whom a dialectical demonstration of the starting point of any particular systematic inquiry into the nature of things was required (*Republic* VII.533c). The five axioms all concern the concept of equality and might be considered as stipulating properties of identity applicable to magnitudes generally, for example, the third: 'Two things equal to a third thing are equal to each other.'

In addition to his axioms or 'common notions', Euclid also stated five postulates which are not asserted as true but rather as hypotheses to be tested through the conformity with experience of results deduced from them. The first three outline the permissible means by which geometric figures may be constructed: (1) by drawing a straight line from any point to any other point; (2) by producing a finite straight line continuously in a straight line; (3) by describing a circle with any given point as centre and any given distance as radius. These postulates essentially

delimit geometric construction as a procedure involving only straight edge and compass. This bounds what has been traditionally termed 'elementary geometry' and one may ask why such constructions were singled out, for at an early date Greek geometers had already recognized that there were many interesting problems in construction which did not appear to be solvable by these means alone. Three famous examples known in ancient times are: to construct a square having the area of a given circle ('squaring the circle'); to trisect a given angle; and to construct a cube having double the volume of a given cube. Plutarch (*c*.46-120) reports that Plato was incensed by the attempts by Eudoxus and Archytas to solve the problem of doubling the cube by employing mechanical instruments in trial and error fashion; for Plato, such methods accorded sense experience an unwarranted legitimacy and hence were a corruption of the 'pure excellence of geometry'. In fact, not until the nineteenth century were rigorous proofs given that these are impossible ruler and compass constructions, each additionally requiring some version of a principle of continuity.

Of the remaining two postulates, (4) All right angles are equal to each other, and (5) Given a line *l* and a point P not on it, there is a unique line parallel to *l* through P, (5) was often singled out as lacking the evidential force of the others. As a result, from Euclid's time up to the early part of the nineteenth century, many attempts were made in vain to derive it from Euclid's other assumptions. (Mathematical practice over the centuries had largely submerged Euclid's evidential distinction between axioms and postulates.) Reflecting on this dismal record in 1819, C.F. Gauss had to admit that 'In the theory of parallels, we are still no further than Euclid', a situation he called 'the shame of mathematics'. Resolution took quite an unexpected form. After unsuccessfully attempting to demonstrate the postulate, both J. Bolyai (in 1823) and N. Lobachevskii (in 1826) independently formulated a consistent non-Euclidean (hyperbolic) geometry in which the fifth postulate did not hold, the other Euclidean axioms and postulates remaining intact. Gauss himself had privately entertained such thoughts as early as 1799. Significantly, Gauss and Lobachevskii (but not Bolyai, who conceived of geometry as a purely logical system based upon axioms) seem to have thought that the truth as to the Euclidean or non-Euclidean character of geometry was an empirical matter to be resolved by certain observations in geodesy or astronomy (for example, stellar parallax). The mathematical and philosophical ramifications of these discoveries were slow to emerge; Bolyai and Lobachevskii had published obscurely and Gauss not at all. But by mid-century, a transformation was underway in the Euclidean conception of geometric knowledge as a unique body of truths concerning space whose certainty was secured by intuition.

2 Towards formal rigour

For nearly two millennia, Euclid's *Elements* was the exemplar of exact reasoning. It is instructive to consider the developments which resulted in overturning this perspective. The first took place between the end of the seventeenth and the end of the eighteenth centuries. For Hobbes, Spinoza and Descartes, reasoning *more geometrico* ('in the geometric manner') attained the deductive ideal, whereby the truth of single propositions inexorably followed from propositions either antecedently established or accepted as fundamental truths. According to Pascal (*c*.1657), the 'art of persuasion' is identified with the method whereby evident axioms are laid down, clear definitions of non-primitive terms are given, and demonstration proceeds in step-by-step fashion. Even Newton, the co-discoverer of the differential and integral calculus, wrote his *Mathematical Principles of Natural Philosophy* (1687) in the axiomatic style of a classical geometric treatise, employing geometric methods of proof where the new methods of the calculus would have been more appropriate.

However, the enormous progress of mathematics in the eighteenth century was almost entirely due to developments in algebra and the new science of analysis, the study of functions and variables pioneered, above all, by Euler. Correspondingly, the guiding ideal of rigour in mathematical proof shifted from the figures and constructions of geometry to the permitted manipulations and transpositions of symbols characteristic of algebra and analysis. Thus Lagrange would famously boast in the beginning of his *Mécanique analytique* (1788) that 'One will not find any figures in this work. The methods that I present require neither constructions, nor geometrical or mechanical reasoning, but only algebraic operations subjected to a regular and uniform development'. Another shift took place at the end of the nineteenth century in tandem with the programme of seeking greater rigour in the calculus, the so-called 'arithmetization' of analysis. Here, the analytic idea of rigour was carried into geometry itself in the demand that deduction not only be independent of diagrams and figures but also of the meaning of geometric concepts. In 1882, Pasch provided an initial account of Euclidean geometry as a hypothetico-deductive system in which the Euclidean definitions of 'point', 'line' and 'plane' were replaced by stipulated unanalysed

relations between these concepts. However, the classic exposition of this point of view is Hilbert's *Grundlagen der Geometrie* (1899) which famously posits 'three different systems of things…points…straight lines…and planes', entities defined only implicitly through relations designated by terms such as 'lie upon', 'between', 'parallel', 'congruent' and 'continuous' whose complete characterization, in turn, lies in those propositions derivable from the chosen axioms. In this abstract conception, there is no longer any trace of the traditional conception of geometry as a theory of *actual* space and its properties. By the early twentieth century, this trend towards axiomatic formalism had completely supplanted the Euclidean paradigm of an exact science.

3 The nature of geometry

According to a once-customary view of mathematics, the two primordial mathematical conceptions are the notions of whole number (as exhibited in counting or ordering) and continuous magnitude or mere extension (as determined in measurement); hence mathematics is ultimately rooted in the sciences of number (arithmetic, algebra, analysis) and the science of space (geometry). However, the conception of geometry as the science of space seems only to have emerged in the late Renaissance, as the modern notion of 'space' arose around 1600 AD (see Space), whereas the science of number has a pedigree reaching back to the speculations of the Pythagoreans. Indeed, the Pythagoreans initially did not clearly distinguish geometry from number. Number was the essential reality, though numbers appear to have been conceived as dots in particular geometric arrangements (thus, for example, the terms 'square number' and 'triangular number', which still survive). The Pythagorean discovery of incommensurable lines (for example, $\sqrt{2}$ which is the diagonal of a unit square) perhaps first effected a separation, for a 'horror of the irrational' prevented a generalization of the concept of number suitable for measurement as well as counting. Hence, irrational magnitudes could only be represented geometrically. As a result, the science of number remained paramount and, in the *Republic*, Plato places the study of geometry after the study of number on the grounds that, unlike the figures of geometry, numbers have no sensible and tangible bodies but are purely objects of thought accessible only to the soul (VII.526). A more compelling reason for the subordination is simply that geometry, in speaking of triangles, quadrilaterals and so on, presupposes number.

The ancient distinction of geometry and the science of number was blurred by the invention of analytic geometry by Fermat (1629) and Descartes (1637). The essential idea here - the introduction of numerical coordinates into the plane - establishes a one-to-one correspondence between plane curves and equations in two variables: to each distinct curve corresponds a definite equation $f(x, y) = 0$. This permits the study of the geometric properties of curves through algebraic or analytic relations connecting their equations, an innovation greatly expanding the variety of curves and figures which can be submitted to precise mathematical treatment. Moreover, coordinates provide a ready means of generalizing from two to three dimensions, and then, as Grassmann (1844) showed, to *n*-dimensional spaces. Thus it is only with the introduction of coordinates that geometry acquires the requisite generality of a 'science of space' (and indeed, more than the requisite generality); ironically, geometry obtains the status of 'science of space' through methods which enable a reduction of geometry to number.

However, the triumph of analytic methods in geometry was carefully circumscribed. Newton, for example, held that equations as 'Expressions of Arithmetical Computation…properly have no place in Geometry', and he celebrated 'the Ancients' over 'the Moderns', in that the former 'never introduced Arithmetical Terms into Geometry' whereas the latter 'by confounding both, have lost the simplicity in which all the Elegancy of Geometry consists' ([1707] 1728: 228; 1967: 120). Newton's intent, it seems, was to insulate only elementary geometry from algebraic methods but not higher geometry, where coordinate methods were actively employed and extended. Other dissenters from the 'triumph of analysis' soon emerged. Most influential were the early nineteenth century French school of projective geometers (L. Carnot, Chasles, Poncelet, among others). Expressing empiricist disdain for the use in calculus and algebra of such 'metaphysical' entities as infinitesimals and negative numbers, they championed instead coordinate-free 'synthetic' methods of proof whereby mathematical certainty was safeguarded by exclusive focus upon a constructed figure (see Poncelet 1822).

At issue here is the status of the diagrams employed in geometric proofs. Were constructed figures merely superfluous, *in concreto* visual aids to clarify bits of abstract reasoning in the text? Or were geometric truths somehow necessarily connected with the quasi-visual evidence provided by representation in 'the mind's eye' of intuition? For Kant, it was clearly the latter. Euclidean geometry characterizes that 'pure form of our sensible intuition' which is space, a condition imposed by the mind upon the experience of the outer sensible world and

thus a condition of the possibility of experience of this world. Furthermore, the ruler and compass constructions of Euclidean geometry are examples *par excellence* of how, for Kant, mathematical knowledge is attained solely through construction of concepts, that is, exhibition a priori of an intuition (for example, a figure such as a triangle) corresponding to its concept which, though particular, is none the less representative of all the universality contained in the concept. A geometric proof is thus 'a chain of inference guided throughout by intuition' (1781/1787: a717; b745).

Mathematical developments in the nineteenth century undermined Kant's conception. First, as noted above, the discovery of consistent (that is, relative to Euclidean geometry) non-Euclidean geometries undercut the prevalent belief in the necessary truth of Euclidean geometry as a characterization of space. Second, the development of projective geometry led to a vastly generalized conception of a geometry as the study of properties of figures invariant under a given group of transformations. Thus, there are as many geometries as there are groups of transformations acting on a space. Third, under the influence of Riemann (see below), physical space came to be seen as a special three-dimensional case of a more general geometric structure. From each of these developments, it followed that the structure of physical space was no longer geometry's sole subject matter. Thus different 'mathematical spaces' came to be distinguished from physical space, and both from a quasi-perceptual and psychological 'space of intuition'. Finally, the trend towards greater rigour in mathematical proof in the latter part of the century denied intuition any intrinsic evidential standing. This in turn promoted axiomatic formalism in geometry, where an explicit recognition that geometric primitives have no pre-axiomatic meaning replaced the traditional view of its primitive terms as indefinable but intuitively secure concepts.

4 Geometry of physical space

Once the conceptual possibility opened that the geometry of physical space is not necessarily Euclidean, the question concerning the structure of this space appeared to be empirically resolvable through measurement. Poincaré (1902) argued, however, that any empirical determination of the geometry of physical space must rest on certain prior conventions concerning metric concepts, such as whether the path of a light ray is considered 'straight'. Others saw a still more fundamental problem concerning what is presupposed by measurement at all. To this, Riemann (1854) and Helmholtz (1868) provided superficially similar but in fact quite different solutions. For both, measurement rests upon the possibility of free mobility of the standard of measurement. However, Riemann interpreted this to mean that magnitudes are independent of their position in what he termed an *n*-fold extended quantity, of which physical space is merely a particular three-dimensional instance (see Space §4). Riemann postulated an analytical expression, a generalization of the Pythagorean theorem to *n* dimensions, which is an invariant measure of the infinitesimal lengths between neighbouring points in such a structure, roughly the modern idea of a real *n*-dimensional differentiable manifold. Given this measure, one can define the arc length of a curve, the angle between intersecting curves, the volume of a region and other geometric concepts. This geometry is locally Euclidean in that it gives a Euclidean metric structure to the tangent space at each point P, hence the measure applies generally to flat and to curved manifolds and also to manifolds with variable (non-constant) curvature. However, in this latter type of manifold, Riemann went on to observe, the magnitude of a solid body is not independent of the position of the body.

Helmholtz, on the other hand, saw the postulate of free mobility as resting upon presumed facts about the behaviour of such bodies *in physical space*, in particular, that there are rigid motions. While acknowledging that the notion of a perfectly rigid body is an idealization to which nothing in the physical world corresponds, Helmholtz none the less saw this concept as a presupposition of measurement in general and hence of the geometry of physical space. As subsequently refined by Reichenbach (1928), who emphasized the impossibility of actually ascertaining whether a physical measuring rod undergoes alterations of length in transport, this view introduces an arbitrary element into measurement in that it makes determinations of the geometry of physical space rest on the adoption of conventions regarding the behaviour of rigid bodies. However, in the generic case of variably curved space-times permitted by Einstein's Theory of General Relativity (1915), the notion of a rigid body is suspect for just the reason suggested 61 years earlier by Riemann: there are no congruences corresponding to the supposed invariant length of a rigid body. In this situation the most consistent procedure, as Weyl pointed out, is to renounce the concept of a transportable standard length. Weyl then showed (1921) how metric properties of the space-time manifold could be mathematically derived from weaker conformal and affine properties having, as their respective empirical correlates, two metric-independent physical processes, the paths of light rays (so-called null geodesics)

and the inertial trajectories of point masses (particles 'too small' to be affected by forces of surrounding physical fields). The essentials of this procedure remain a matter of live interest among general relativists (see Ehlers 1988).

5 But what is geometry?

With the triumph of formal axiomatics, geometry had lost its two most distinctive characteristics: its standing as the theory of physical space and the intuitional trappings attending its traditional reliance on figures and constructions. What then distinguishes geometry from any other formally axiomatized mathematical theory? Surveying the subject in 1932, two eminent geometers wrote:

> The question then arises why the name geometry is given to some mathematical sciences and not to others. It is likely that there is no definite answer to this question, but that a branch of mathematics is called a geometry because the name seems good, on emotional and traditional grounds, to a sufficient number of competent people.
>
> (Veblen and Whitehead 1932: 17)

Yet, as Cartan (1936) quickly pointed out, even in mathematics such a consensus may be difficult to achieve. This is not to say that boundaries are not still drawn. A leading contemporary geometer recently suggested that 'a property is geometrical, if it does not deal directly with numbers or if it happens on a manifold, where the coordinates themselves have no meaning' (Chern 1990: 685). In any case, it must be admitted that geometry has not been completely assimilated into the rest of mathematics, in part, perhaps, because the physical world continues to suggest geometric analogies. Moreover, mathematicians continue to speak of 'geometric intuition' as a fertile source of mathematical invention, even while recognizing that distinctions between geometry and other areas of mathematics remain a matter of taste. And although some mathematicians doubt that 'the psychological aspects of true geometric intuition' will ever be 'cleared up' (Weil 1978), others speculate that the visual-intuitive mode of cognition so characteristic of geometry stems from a lateral specialization of the brain localized in the right hemisphere of the cerebral cortex (Yaglom 1988: 26).

George of Trebizond (*c.*1396-*c.*1472)

George was a fifteenth-century humanist important for his work in rhetoric, his translations from the Greek, and his role in the Renaissance Plato-Aristotle controversy. In 1458, as a fierce opponent of Plato and supporter of Aristotle, he transformed what had previously been a quarrel among Byzantines into a major European controversy. He also wrote the first and, for a time, the most popular humanist manual of logic.

Born and brought up in Crete (his Greek name 'Trapezountios' is a patronymic, not a toponymic), George emigrated to Italy around 1416 when twenty years old. Mastering Latin with startling speed, he became a teacher of Latin eloquence in northern Italy. He confirmed his reputation with the publication at Venice in 1433-4 of his book on rhetoric, which was the first full-fledged work on the subject in the classical mode since antiquity. In the late 1430s, at Florence, he published an *Isagoge Dialectica (Introduction to Logic)*, which became a best-seller in the first half of the sixteenth century as humanists attempted to wrest the teaching of logic from the philosophers (see Logic, Renaissance). George himself had no polemical purpose. He merely wished to extract from Aristotle and the manuals of contemporary Aristotelians that small and simplified amount of logic needed by someone primarily interested in rhetoric and literature. Around this time he also joined the papal bureaucracy, becoming eventually a papal secretary. In Florence and (after 1442) in Rome, he continued to teach rhetoric, but he also began to translate from the Greek. His work as a translator peaked under Pope Nicholas V (1447-55), who commissioned him to translate into Latin all of Aristotle's zoological works, the pseudo-Aristotelian *Problemata*, Plato's *Laws*, Ptolemy's *Almagest* and patristic texts (including Eusebius of Caesaria's *Preparation of the Gospels*, which preserves a great many classical philosophical fragments). A quarrel with the pope over his commentary on Ptolemy's *Almagest* drove George to the Neapolitan court of King Alfonso of Aragon in 1452, but he returned to Rome in 1455. Thereafter, he lived in Rome until he died about 1472 (apart from a foray to Venice in 1460-1, where he propounded the theory that the Venetians had realized the ideal mixed constitution of monarchy, aristocracy and democracy).

In the mid-1450s George turned on the Greek Cardinal Bessarion. Though himself a pious Christian, Bessarion had studied with the neo-pagan Byzantine Platonist Pletho. George became convinced that Bessarion and his circle of Greek and Latin humanists were engaged in a Platonic conspiracy to paganize the Latin West. The first result was George's treatise of 1456, the *Protectio Aristotelis Problematum (Protection of Aristotle's Problemata)*, which warned of the attempt of the Bessarion circle (and especially Bessarion's client, the Greek scholar Theodore Gaza) to undermine Latin Aristotelianism and theology by disseminating perverse translations of Aristotle. In 1458 George published (in manuscript form) the first major Latin work in the Plato-Aristotle controversy, the *Comparatio Philosophorum Aristotelis et Platonis (Comparison of the Philosophers Aristotle and Plato)* (printed in 1523 as *Comparationes philosophorum Aristotelis et Platonis*).

The *Comparatio* is divided into three books. In the first, George compares the two philosophers as scholars, and seeks to demonstrate that while Aristotle is the foundation of scientific knowledge, Plato was a mere literary dabbler. In the second, he measures the doctrines of both Aristotle and Plato against the standard of Christian truth. Plato fails miserably because he believed in the transmigration of souls, creation from pre-existent matter, and a hierarchy of gods. Aristotle, on the other hand, taught the immortality of the soul, creation of the world from nothing, and monotheism. George even argues that Aristotle had an inkling of the Christian Trinity. To prove the latter contention, George resorted to the exemplarist doctrine of the medieval Platonic tradition, which found Trinitarian vestiges in all creation. George attributed to Aristotle a hylomorphic conception of the soul and argued that creation *ex nihilo* was a philosophically necessary doctrine. Ironically, both positions reflected the medieval Platonic tradition of the Franciscan-Augustinian school rather than the Christian Aristotelianism of Thomas Aquinas, whom George cited. In Book 3, George revealed his true purpose: to warn the West of the Platonic conspiracy. He showed that Platonists propounded and practised homosexuality. He warned that their doctrines had been the cause of Christian heresies, that Muhammad himself had been trained by a Platonist, and that more recently Pletho had tried to revive heathenism. Now, the Platonists (meaning Bessarion and his circle) stood poised to capture the church. Bessarion answered George in 1469 with his monumental *In calumniatorem Platonis (Against Plato's Calumniator)*, which rehabilitated Plato by making him a semi-Christian Neoplatonist, by arguing that Aristotle was a pagan, and by ignoring George's attack on Pletho's pagan agenda. This phase of the

Plato-Aristotle controversy ended with the deaths of Bessarion and George about 1472.

Gerard of Cremona (1114-87)

Gerard of Cremona was the most important translator of philosophical works from Arabic to Latin in the twelfth century. During a career of about forty years, he translated at least seventy books. The most famous translations are those of works of Aristotle, including Posterior Analytics, Physics, On the Heavens, On Generation and Corruption and Meteorology 1-3. Gerard also translated a number of works as part of the Aristotelian corpus that were not at all Aristotelian; the most important of these is the so-called Liber de causis (Book of Causes). However, the Aristotelian translations were only a small part of his labour. He translated many more works that were medical, astronomical or mathematical, bringing into Latin several small libraries of fundamental natural science.

What is known of Gerard's life comes principally from three related documents: a list of his translations prepared by his assistants, a later biographical note and a verse eulogy. According to the biographical note, Gerard came to Toledo from Italy in search of Ptolemy's *Almagest*. He stayed to learn Arabic when he discovered just how much in that language was inaccessible to the Latins. So far as modern scholarship can determine, this would have been about 1140. His first translation seems indeed to have been of Ptolemy, since it is only for this work that the list of translations assigns a native collaborator. After the *Almagest*, Gerard is known to have translated at least seventy more works.

Gerard's assistants divided the translated works by subject. The richest subjects are medicine (24 works), mathematics, including optics, weight and dynamics (17 works), and logic or philosophy (14 works). The last group contains some of Gerard's most famous translations, including Aristotle's *Posterior Analytics* (revised from the version of James of Venice, with the commentary of Themistius), *Physics* (with the commentary of al-Farabi), *On the Heavens*, *On Generation and Corruption* and *Meteorology* 1-3. It should be noted that Gerard was concerned to provide commentaries alongside the Aristotelian texts. Some of these commentaries were originally Greek (as in the case of Themistius on the *Posterior Analytics*), though Gerard brought them in from Arabic. Other commentaries and expository treatises had been written in Arabic as part of the Arab peoples' own appropriation of Greek learning (as in the case of al-Farabi's commentary on the *Physics*).

Gerard also translated a number of works as part of the Aristotelian corpus that were not at all Aristotelian. The most important of these is the so-called *Liber de causis (Book of Causes)*, a compilation of material mostly from Proclus (see Liber de causis). This treatise on the cosmic participation of such transcendental features as goodness or unity was read for about a century after Gerard's translation as if it had been written by Aristotle, and guided interpretations of the whole Aristotelian corpus.

Gerard's translations are notable for their fidelity to the Arabic. They preserve its syntax and its lexicon as much possible. Even when Gerard had access to an earlier Latin translation based on the Greek, he would weigh its meaning against what he had gathered from the Arabic, often standardizing the technical terminology to reflect Arabic usage. When the original was in Arabic, Gerard would revise earlier Latin versions and restore passages that had been abridged or omitted. The resulting version does not always make for easy reading, but Gerard seems to have imagined that the texts would not function as isolated discourses so much as parts or stages of a complete curriculum. The influx of Arabic learning into the Latin West was an influx of new texts that mediated organized bodies of knowledge. It was not enough that the texts be put into a passable Latin; they had to be glossed, interpreted, reconciled and corrected in circumstances very different from the circumstances of their Arabic transmission. Gerard meant to help this labour by providing not just single texts, but groups of texts that would serve to introduce bodies of knowledge in a coherent and ordered way. Gerard was not just translating Arabic texts, he was importing Arabic curricula. It would be at least a century before these curricula would be appropriated in any active way by his Latin readers.

MARK D. JORDAN

List of works

Gerard of Cremona (before 1187) Revision of James of Venice's translation of Aristotle's *Posterior Analytics*,

ed. L. Minio-Paluello and B. Dod, Aristoteles Latinus 4.3, 2nd edn, Leiden: Brill, 1968.(This Aristotelian work was fundamental for the medieval reconceiving of the nature of knowledge.)

Gerard of Cremona (before 1187) Translation of Aristotle's *Meterology* 1-3, ed. A. Pattin and É. van de Vyver, *Études d'histoire littéraire sur la scolastique médiévale*, Philosophes Médiévaux 8, Louvain and Paris: Publications universitaires, 1964, 241-71.(This Aristotelian work provided medieval Latin readers with the bases for an account of elemental interactions.)

Gerard of Cremona (before 1187) Translation of Themistius' commentary on Aristotle's *Posterior Analytics*, ed. J.R. O'Donnell, *Mediaeval Studies* 20, 1958, 239-315.(Themistius' commentary provided medieval Latin readers with some access to late classical readings of Aristotle.)

Gerard of Cremona (before 1187) Translation of al-Kindi's *De quinque essentiis (On the Five Essences)*, ed. A. Nagy, *Die philosophischen Abhandlungen des Ja'qub ben Ishaq al-Kindi*, Beiträge zur Geschichte der Philosophie des Mittelalters 2.5, Münster: Aschendorff, 1897, 28-40.(This text provided medieval Latin readers with an introduction to Neoplatonic cosmology.)

Gerard of Cremona (before 1187) Revision of Gundissalinus' abridgement of al-Farabi's *Catalogue of Sciences*, ed. A. González Paléncia, Madrid and Granada: Instituto Miguel Asin, 1953.(The *Catalogue* describes a hierarchy of liberal arts and philosophical sciences.)

Gerard of Cremona (before 1187) Revision of an earlier translation of the *Liber de causis (Book of Causes)*, ed. A. Pattin, *Tijdschrift voor Filosofie* 28, 1966, 90-203.(The *Liber de causis*, believed still to be a work of Aristotle, provided a deeply Neoplatonic ontology.)

Anon. (*c*.1187) List of Gerard's Translations, ed. F. Wüstenfeld, 'Die Übersetzungen arabischer Werke in das lateinische seit dem XI. Jahrhunderts,' *Sitzungsberichte der K. Akademie der Wissenschaften in Wien*, Phil.-hist. Kl. 149 (4), 1904, and 151 (1), 1906; trans. M. McVaugh in *A Source Book in Medieval Science*, ed. E. Grant, Cambridge, MA: Harvard University Press, 1974, 35-8.(List of Gerard's translations compiled by his assistants.)

Gerard of Odo (*c.*1290-*c.*1349)

Gerard of Odo, a scholastic philosopher and theologian who wrote a long commentary on Aristotle's Nicomachean Ethics, is one of many scholastics who attempted to reconcile Aristotle's teachings with the views of Christian authorities. Gerard's work declares the subject of ethics to be the human being as free, makes the will's power of self-determination a necessary condition for moral responsibility, and in other respects reflects the voluntarism commonly found in Franciscan writings of the period.

Gerard of Odo has long been remembered by Church historians as the papal associate who became minister general of the Franciscan order in 1329. At the time, the Franciscans were badly divided about the kind of life required by their vow of poverty. Pope John XXII deposed the head of the order and nominated Gerard, his own candidate, as the new minister general. Gerard continued in that position until 1342, when he was named patriarch of Antioch and bishop of Catania.

Gerard's accomplishments as a bachelor and master of theology at Paris were better received than his performance as an administrator. His writings include a commentary on the *Sentences* of Peter Lombard, two treatises on logic - one on syllogisms, the other on supposition (*De suppositionibus*) - as well as a treatise on economics (*De contractibus*) and a long commentary on the *Nicomachean Ethics*. His discussion of continua, once thought to be a fragment of some lost work on Aristotle's *Physics*, comes from his *Sentences* commentary.

Gerard's most important contribution by far was his commentary on Aristotle's *Ethics*, which might explain how he came to be called 'the Moral Doctor.' The better-known *Ethics* commentary by the nominalist John Buridan borrows extensively from Gerard's work, which favours a more realist, Neoplatonist metaphysics. Despite the seemingly prohibitive metaphysical differences, Buridan plainly found the work of the Moral Doctor well worth his attention (Walsh 1975).

Gerard's commentary on the *Ethics*, probably the first such work by a Franciscan, signals its emphasis on freedom from the outset. The prologue declares the subject of ethics to be the human being as *free*. Though this opens the possibility that ethics extends to angels, Gerard argues that angelic freedom differs significantly from human freedom, and since we know little about angels in any case, we apply ethics only to mankind. Nevertheless, he adds, ethics could apply to other creatures if any possessed a freedom similar to our own.

Gerard sees the will's power of self-determination as the source of freedom and a necessary condition for moral responsibility. Among the powers of the soul, the will holds the position of king, the intellect only of king's counsellor. Because the will can act against the advice of the intellect, and the intellect cannot influence the emotions without the concurrence of the will, moral weakness arises from weakness of will. In a similar vein, Gerard opposes Aquinas in insisting that all moral virtues must belong to the will. Aquinas' commentary on the *Ethics* claims that temperance and courage have to do mainly with how someone is internally affected by the passions, whereas justice has mainly to do with how one acts externally; thus the former are virtues of the emotional part of the soul, while the latter is a virtue of the will. Quoting Aquinas with strong disapproval, Gerard argues that *all* moral virtues moderate passion but nonetheless are principally concerned with action. For him, all moral virtues are habits of choice: hence habits of the will, since choice is an act of the will (see Free will).

On these and many other points, Gerard's commentary reflects the voluntarism so often found in Franciscan writings of the late thirteenth and early fourteenth centuries. His work attempts to interpret Aristotle's *Ethics* in such a way that it supports, or at least does not contradict, teachings prevalent in his own order (Kent 1984).

Gerard's *Sentences* commentary placed him among the 'indivisibilists' in the scholastic debate about continuous magnitudes. He argues that a continuum is composed of extensionless points, distinct from mathematical points in admitting relative differences in time and space (Zoubov 1959). Here, as in the metaphysics of his *Ethics* commentary, Gerard diverges sharply from Aristotle's teachings. The arguments against indivisibles in Book VI of the *Physics* allow for no genuine doubt about Aristotle's views.

Gerard, Alexander (1728-95)

Alexander Gerard was Professor of Moral Philosophy and Logic (1752) and Professor of Divinity (1759) at Marischal College, and Professor of Divinity (1773) at King's College, Aberdeen. A leading member of the Aberdeen Philosophical Society, he wrote a new plan of education for Marischal College as well as works on divinity. He is best known, however, for his Essay on Taste (1759). In 1774, he returned to the subject with An Essay on Genius. Gerard was associated with Thomas Reid (1710-96) in the Philosophical Society until Reid's transfer to Glasgow in 1764. The work of David Hume (1711-76) was a principal influence.

Alexander Gerard's aesthetic philosophy is a response to the theories of Francis Hutcheson (1694-1746) and David Hume (see Hume, D. §3). Like Hutcheson, Gerard made use of the concepts of an internal sense and of association to explain the subjectivity of taste. However, Gerard's use of an internal sense, which he called a reflex act, must be severely qualified. He distinguished two ways of considering taste:

> It may be considered either as a species of *sensation*, or as a species of *discernment*…. Taste considered in the former of these lights, in respect of what we may call its *direct exercise*, cannot properly admit any standard… But notwithstanding this, there may be a standard of taste in respect of its *reflex acts*: and it is only in respect of these, that a standard should be sought for.
>
> (1759: 214-6)

This distinction distances Gerard from Hume's more radical reliance on sentiment and Hutcheson's elaborate theory of an internal sense. Gerard depended on a species of induction (perhaps derived from another Aberdeen philosopher, George Turnbull) to correct immediate sensation.

Gerard's own theory rests on a view of the imagination as exercising the mind. Freed of the need for the actual presence of objective sources, which limit the external senses, the imagination combines reflective ideas supplied by fancy. The operation of the imagination exercises the mind, and when that exercise falls within a moderate range, it is experienced as pleasurable. If it is either too languid and easy or too excited and difficult, discomfort (or indifference) results. From the beginning, these were the controlling principles of Gerard's discussion. But the terms of the problem set for him (and in some sense his essay was a set piece for the Edinburgh Society for the Encouragement of Arts, Sciences, Manufactures and Agriculture) come from Hutcheson's internal sense theory and Hume's search for a standard of taste. So Gerard used 'taste' as a vehicle to explain the faculty of the imagination. He was not always consistent, and sometimes it seems that he forgot that the problem of taste arose because an internal sense would lack the checks and confirmations of an external sense.

Gerard tended to multiply senses because they were little more to him than aesthetic predicates. Association establishes the reference for such predicates. Thus, while continuing to use the language of taste and internal sense, he was moving decisively in the direction of Archibald Alison's more elaborate scheme of imaginative and associative aesthetics (see Alison, A.). At the same time, Gerard remains within the scope set by Reid and his school.

Gerbert of Aurillac (938-1003)

Gerbert is chiefly remembered as an educational reformer. He established a syllabus for the university course in logic, the logica vetus*, that remained in use until the mid-twelfth century. Most of his academic writings are instructional works on mathematics. In his single philosophical work, De rationali et ratione uti (On That Which is Rational and Using Reason), he uses Boethius' logical commentaries to develop a distinctly Platonic solution to a problem he derives from Porphyry's Isagōgē.*

Gerbert began his studies as a Cluniac monk at Aurillac. It is generally supposed, although documentation for this period is not good, that he was exposed to Islamic science and mathematics during a subsequent stay in Catalonia. He moved to Rheims around 972 to continue his studies, and later became director of schools there. After a brief and stormy tenure as Abbot of Bobbio, *circa* 980-3, he returned to Rheims, where he continued to engage in political controversy. In 991 he was made archbishop, and in 998 was transferred to Ravenna. He was elected as Pope Sylvester II in 999, and died in Rome in 1003.

During Gerbert's first stay at Rheims, he instigated educational reforms which were to influence the curriculum of cathedral schools and universities for at least the following two centuries. Gerbert is the first person documented to have taught the syllabus of the *logica vetus*, the basis for logic teaching until the mid-twelfth century. He used Porphyry's *Isagōgē* in the translations of Marius Victorinus and Boethius, Aristotle's *Categories* and *De interpretatione* in Boethius' versions, Cicero's *Topics*, Boethius' commentaries on these works and Boethius' own logical works (see Aristotle; Cicero; Porphyry). In addition to studying these works, his students were required to engage in 'controversies' on set questions (see also Language, medieval theories of; Logic, medieval).

In teaching astronomy, Gerbert used a spherical model to illustrate the movement of the planets and had his students make astronomical observations. Mathematics was an area of particular interest for Gerbert; several of his letters include mathematical discussions in response to questions from his students, and he also wrote longer mathematical treatises. He taught arithmetic using the arabic numerals from one to nine rather than Roman numerals (though he did not adopt the arabic zero), and instructed his students in the use of the abacus. His treatise on the use of the abacus later became a standard work. For geometry, he supplemented a fragmentary version of Euclid with his own treatise. Gerbert is also known to have reintroduced the study of classical authors including Virgil, Terence, Horace, Persius, Lucan, Seneca and Quintilian. Fulbert of Rheims, founder of the school of Chartres, was one of his students (see Chartres, School of).

Gerbert's one extant philosophical work, *De rationali et ratione uti (On That Which is Rational and Using Reason)* has been examined by Marenbon (1983). It shows Gerbert using Porphyry's *Isagōgē*, Aristotle's *De interpretatione* and Boethius' commentaries on the same works to explain a problem arising from Porphyry's discussion of differentia: why *ratione uti* can be predicated of *rationale*. As Marenbon explains, Gerbert uses the opposition between act and potency (discussed in both the *Isagōgē* and the *De interpretatione*), Aristotle's remarks on psychology at the beginning of the *De interpretatione* and a metaphysical hierarchy from the beginning of Boethius's first *Isagōgē* commentary in developing his solution. Gerbert claims that when *rationale* is considered just as a concept, apart from any instance in a human being, then its scope is no narrower than that of *ratione uti*. It is only when the concept *rationale* is attached to a corporeal human being that it is no longer always in act, but becomes a potentiality realized in act only when the person who is rational is indeed using reason. When *rationale* is attached to a corporeal being, then, it is acceptable to predicate *ratione uti* of it. When we say 'that which is rational uses reason', it is understood that we are referring to some particular rational being which is currently using its reason, not to 'that which is rational' taken in a general sense.

A philosophical debate between Gerbert and Otric held before Emperor Otto II is recounted by Gerbert's student Richer. While the word-for-word dialogue Richer includes is most likely of his own composition, the event may well have occurred. According to Richer, the debate ranged over the proper division of philosophy, the cause of the creation of the world, whether all causes can be expressed by the single word 'good', the cause of a shadow and whether 'mortal' or 'rational' is the wider concept. Whether or not Richer's account faithfully reports Gerbert's replies, it remains a testimony to his effective teaching.

Gerdil, Giancinto Sigismondo (1718-1802)

A lifelong member of the Barnabite religious order, Gerdil became well-known as the most eminent Italian disciple of Malebranche (and critic of Locke); in 1764 he published a critique of Émile (1762) which Rousseau himself called the only attack worth reading in its entirety. Only extreme old age kept Cardinal Gerdil from being elected Pope at Venice in 1798.

Born in Savoy, Gerdil became a lifelong member of the Barnabite religious order and, as a Cardinal in 1798, was kept from being elected Pope at Venice only by extreme old age. He is best-known, however, as the most eminent Italian disciple of Malebranche (1638-1715) and a critic of Locke and Rousseau.

As a follower of Malebranche, Gerdil defended the principal doctrines of the celebrated Oratorian Father: that God governs the universe through consent, uniform *volontés générales* (general wills), not through *ad hoc* miraculous *volontés particulières* (particular wills); that human beings are only the ‘occasional’ causes of their own acts (while God is the true cause); that ‘we see all things in God’, not in Lockean sense-perception. Gerdil was also distressed by the Lockean notion that the natural immortality of the soul is only highly ‘probable’, that only revelation (but not reason) can offer certainty on this point. Here Gerdil’s key works are *The Immateriality of the Soul, Demonstrated against Locke* and *Defence of the Sentiment of Father Malebranche against this Philosopher* (both published 1747-8).

But it was as a critic of Rousseau that Gerdil gained a European reputation. In his *Réflexions* on Rousseau’s political, religious and pedagogical theory (1764), Gerdil urged that ‘the purpose of *The Social Contract* is the universal overturning of the civil order; the purpose of *Émile* (1762) is to prepare minds for this through a total revolution in ways of thinking’. Granting Rousseau’s eloquence and ‘brilliance of colouring’ as a writer, Gerdil insisted that Jean-Jacques’ clinging to (supposedly uncorrupted) ‘nature’ would produce ‘bad Christians and bad citizens’. Rousseau’s supposed ‘natural man’, for Gerdil, is ‘the most factitious [being] that has ever existed in the mind of any philosopher’: ‘no one today has seen a man detached from every social institution, no one can say what he is’. Despite the ‘persuasiveness’ of Rousseau’s ‘blinding’ eloquence, in Gerdil’s view, the citizen of Geneva’s thought amounts to:

> contempt for all revealed religion, and for Christianity in particular…; a revolt against all legitimate authority: … a false indulgence in not reprimanding the faults arising from children’s natural liberty; a false determination not to reason with them, and not to cultivate their minds by any of the studies suitable to their age - such are the fruits of this new plan for education.

(*Réflexions*)

If Rousseau alone is right, Gerdil adds tartly, then Socrates, Plato, Cicero, Seneca, Plutarch, Bacon, Bossuet and Fénelon knew nothing about human nature or suitable education. And he ends the *Réflexions* with a paragraph whose literary effectiveness Rousseau himself acknowledged:

> ‘M. Rousseau is opening a new career. Men will no longer be depraved by arbitrary institutions, they will no longer be terrified by the importunate threats of religion; they will no longer be fatigued by studies which are so remote from their nature. What chimeras! What visions!’

German idealism

From the late eighteenth century until the middle of the nineteenth, German philosophy was dominated by the movement known as German idealism, which began as an attempt to complete Kant's revolutionary project: the derivation of the principles of knowledge and ethics from the spontaneity and autonomy of mind or spirit. However, German idealists produced systems whose relation to Kant is controversial, due to their emphasis on the absolute unity and historical development of reason.

As a movement to complete Kant's project, German idealism was punctuated by controversies about whether certain Kantian distinctions constitute *dualisms* - unbridgeable gaps between elements whose underlying unity must be demonstrated - and about how such dualisms can be overcome (see Kant, I. §3). One controversy concerned the distinction between the form of knowable objects - contributed by the mind, according to Kant - and the *matter* of sensation - contributed by mind-independent things-in-themselves. Jacobi objected that things-in-themselves lay beyond the boundaries of human knowledge, so Kant should profess 'transcendental ignorance' about the origin of sensible matter, leaving open the possibility that reality is mind-dependent. Another controversy concerned Kant's distinction between the spatio-temporal forms of sensibility and the categorial forms of understanding. Maimon (1790) argued that unless the underlying unity of this distinction were demonstrated, the applicability of categories to sensible objects could not be demonstrated against sceptics like Hume. Instead of defeating scepticism as he intended, some thought Kant had ensured its triumph by establishing unbridgeable dualisms between mind and reality, and between understanding and sensibility.

In the 1790s, some Kantians - notably Reinhold, Fichte and Schelling - sought to complete Kant's project through systematization. Troublesome dualisms would be overcome by positing distinct mental forms, as well as the distinction between mind and reality, as necessary conditions of the mind's free and unitary activity, and thus as necessary elements of a unified system (see Fichte, J.G. §3; Schelling, F.W.J. von §1). However, other Kantians - notably Buhle - accused the systematizers of undermining the distinctness of form and matter, and of attempting to generate matter from pure form. Meanwhile the systematizers, seeking to defeat scepticism, claimed metaphysical knowledge grounded in intellectual intuition of the mind's spontaneity (see Fichte, J.G. §5). But Kant had explicitly denied that humans could attain such knowledge.

Professing continued allegiance to Kant despite these apparent departures, some systematizers - notably Fichte - claimed that Kant's teaching was only intelligible from a special standpoint and that, having attained that standpoint, they were expressing Kant's spirit, if not his letter. However, in his 1799 *Open Letter on Fichte's Wissenschaftslehre*, Kant publicly repudiated all attempts to discern his philosophy's spirit from a special standpoint and rejected any endeavour to bridge the gap between form and matter. But those who were repudiated did not change their ways. Finding Kant unable to complete the revolution he had started, they henceforth constructed their systems more independently of Kant's writings. The influence of pre-Kantian philosophers, notably Spinoza, was explicitly acknowledged.

In order to overcome Kantian dualisms without ignoring his distinctions, Idealists produced a variety of developmental monisms (see Fichte, J.G. §3; Schelling, F.W.J. von §2; Hegel, G.W.F. §4). Such systems portray a single, developing principle expressing itself in dualisms whose unstable, conflictual nature necessitates further developments. Thus reality is a developing, organic whole whose principle can be grasped and whose unity can be articulated in a philosophical system. But the dualisms encountered in everyday experience are not illusory. Rather, they are necessary stages in reality's development towards its full realization. This conception of development is often called dialectic.

Developmental monism emphasized the sociality and historicity of reason. Fichte was the first to emphasize sociality, arguing that the development of individual self-consciousness required consciousness of another mind, and deriving a theory of justice from the idea of one individual *recognizing* another as such (see Fichte, J.G. §7). Hegel placed particular emphasis on historicity, portraying human history as a series of conflicts and resolutions culminating in a just society that would enable the reciprocal recognition of individuals, as well as the perfect self-recognition of reason at which philosophy had always aimed (see Hegel, G.W.F. §8). Thus history - especially the history of philosophy - acquired unprecedented significance as the narrative of the mind's ascent to

self-knowledge. And it was hoped that a philosophical account of society's historical development would correct the deficiencies of the French revolution, which was often called the political equivalent of Kant's revolution.

Idealists disagreed about whether Kant's distinction between mind and nature was another problematic dualism. Schelling and Hegel argued that a systematic philosophy must portray nature as the mind's preconscious development. But Fichte regarded their philosophy of nature as a betrayal of Idealism that explained the mind in nonmental terms and deprived the mind of its autonomy. By 1801 the disagreement was explicit (see Fichte, J.G. §6; Schelling, F.W.J. von §§1, 2; Hegel, G.W.F. §§3, 7).

Controversy about another putative dualism - between concept and intuition - ended the alliance between Schelling and Hegel. Without naming him, Hegel's *Phenomenology of Spirit* (1807) appeared to criticize Schelling's view that philosophy can only be understood by those innately able to intuit - to grasp non-discursively - the identity implicit in apparent dualisms. Hegel argued that the completed philosophical system must be conceptualized and rendered discursively intelligible to everyone. However, only those who transformed their accustomed ways of thinking could understand the system (see Hegel, G.W.F. §§5, 6). So Hegel undertook to guide his readers through a series of transformations of consciousness representing the history of human thought, as well as the education of the individual. The Napoleonic wars forced Hegel from university life, but after his return in 1814, and especially after his move to Berlin in 1818, his version of idealism - with its portrayal of reason developing in both nature and culture towards conceptual articulation - became dominant.

However, Hegel died in 1831 and Schelling raised influential criticisms of Hegel when he began teaching in Berlin in 1841. In an inaugural lecture before an audience including Engels and Kierkegaard, Schelling argued that Hegel's system was an inevitably failed attempt to overcome the dualism between conceptual thought and intuited existence. Schelling's criticism was seminal for Marxism and existentialism and was more influential than his alternative proposals, which he had been developing under the influence of theosophy since 1809 (see Existentialism; Marxism, Western; Schelling, F.W.J. von §§3, 4; Hegelianism §3). The relationship between thought and existence remains problematic for post-idealist philosophy, and German idealism remains both an object of criticism and a source of insight.

PAUL FRANKS

List of works

Collected works, critical editions and English translations can be found in the entries on individual philosopher throughout the *Encylopedia*. Below are listed some texts of particular importance for the historical development of German idealism.

Behler, E. (ed.) (1985) *Fichte, Jacobi and Schelling: Philosophy of German Idealism*, New York: Continuum. (Contains translations of Fichte's Sun-Clear Report and Jacobi's Letter to Fichte, both relevant to the controversy about whether Idealism has atheistic and nihilistic implications, as well as important writings by Schelling on aesthetics, the philosophy of nature and the difficulties facing any philosophical account of the freedom to do evil.)

Giovanni, G. di and Harris, H. (eds) (1985) *Between Kant and Hegel: Texts in the Development of Post-Kantian Idealism*, Albany, NY: State University of New York Press.(Contains translated and annotated extracts from important texts by Reinhold, Aenesidemus, Maimon and Beck that were pivotal in the debate between sceptical and systematic interpretations of Kant, as well as articles from the *Critical Journal* of Hegel and Schelling, dating from their early alliance.)

Hegel, G.W.F. (1807) *Phänomenologie des Geistes (Phenomenology of Spirit)*, trans. A.V. Miller, Oxford: Clarendon Press, 1977.(Hegel's early attempt to complete Kant's revolution by leading the reader through a series of dualistic forms of consciousness, representing the history of human thought, until the reader reaches the standpoint of absolute knowledge by seeing the dialectical development of each form into the next, and the dialectical development of the entire series into knowledge free of dualism.)

Hegel, G.W.F., Schelling, F.W. J. von, Hölderlin, J.C.F. (1796) *Das älteste Systemprogram; Studien zur Frühgeschichte des deutschen Idealismus*, ed. R. Bubner, Bonn: Bouvier, 1973; trans. as *The Oldest System Programme of German Idealism*, in E. Behler (ed.) *Fichte, Jacobi and Schelling: Philosophy of German Idealism*, New York: Continuum, 1985.(Written in Hegel's hand but of disputed authorship, this provides a remarkable glimpse of the origins of German idealism; for interpretation and reception-history see F.-P.

Hansen's *'Das älteste Systemprogram': Rezeptionsgeschichte und Interpretation*, Berlin and New York: de Gruyter, 1989. The Bubner volume contains useful German articles on the content and authorship of the manuscript.)

Jacobi, F. (1785-1815) *The Main Philosophical Writings and the Novel Allwill*, trans. G. di Giovanni, Montreal and Kingston, London, Buffalo, NY: McGill-Queen's University Press, 1994.(Collection of important texts, with an introduction, notes and bibliography. Although Jacobi was not, strictly speaking, a German idealist, many of his ideas greatly influenced Idealism. For example, the Idealists should be understood as accepting his criticism of Kant's conception of the thing-in-itself, and as inspired by the Spinozism he brought to their attention, although Jacobi himself publicized Spinozism only in order to reject it.)

Kant, I. (1799) 'Erklärung in Beziehung auf Fichtes Wissenschaftslehre' (Open Letter on Fichte's Wissenschaftslehre), in *Kant: Philosophical Correspondence, 1759-99*, ed. and trans. A. Zweig, Chicago, IL: University of Chicago Press, 1967, 253-4.(Kant publicly repudiates Fichte and Beck for claiming that the correct interpretation of his writings would be understood only from a special standpoint, according to the spirit and not the letter. Implicitly repudiated are Schelling, Hegel and all others who distinguish, in their own ways, between the letter and the spirit of Kant's philosophy.)

Maimon, S. (1790) 'Versuch über die Transcendentalphilosophie mit einem Anhang über die symbolische Erkenntnis und Anmerkungen' (Essay on Transcendental Philosophy with an Appendix on Symbolic Cognition and Annotations), in S. Maimon, *Gesammelte Werke*, ed. V. Verra, Heidelberg: G. Olms, 1965-75, vol. 2.(An influential work that presses the case against various Kantian dualisms with great clarity, and proposes a monistic solution whereby the dualisms afflicting the finite, human mind represent an imperfect yet necessary stage on the way towards the realization of the infinite, divine mind.)

Simpson, D. (ed.) (1984) *German Aesthetic and Literary Criticism: Kant, Fichte, Schelling, Schopenhauer, Hegel*, Cambridge: Cambridge University Press.(Contains texts relevant to the philosophy of art and literature.)

Gerson, Jean (1363-1429)

Gerson was one of the leading theologians of the via moderna*, the 'modern way' of nominalism. A fervent critic of the 'formalists' of the* via antiqua*, Gerson stood in the Ockhamist tradition as a pastoral theologian opposed to strictly speculative questions. His overarching interests lay in the pastoral foundations of theology and opposed abstract and hence 'unedifying' metaphysical questions, as these dominated scholastic discourse in the theological faculty at Paris. He sought to mediate between increasingly polemical school disputes, arguing for the recovery of a 'biblical' theology that led away from speculative questions toward mystical encounter with God. Later known as* doctor christianissimus *(the most Christian doctor), Gerson exerted such a profound influence upon the subsequent theological horizon that one historian has aptly called the fifteenth century 'le siècle de Gerson'.*

Educated at the College of Navarre in Paris, Gerson attained his *licentia* (1381) and *magister* (1382) in arts before completing his *baccalaureus formatus* in 1390-2 and attaining the licentiate in theology in 1392. In 1395 he was appointed chancellor of Notre Dame and assumed administrative oversight for the University of Paris. Gerson's tenure of this office shaped in practical ways his approach to philosophical questions. His opposition to 'speculative' metaphysical questions that exceeded the 'revealed' truths of scripture must be set alongside his lifelong interest in 'mystical' theology (see for example his *De mystica theologia (On Mystical Theology)*), but he conceived of the latter not as an abstract or speculative form of cognition but in terms of its transformative power that led toward an experiential and affective understanding (*cognitio experimentalis et affectualis*). At the conclusion of the Council of Constance (1414-8), which Gerson attended as representative of the university and the province of Sens, he completed his important treatise *De consolatione theologiae (On the Consolation of Theology)*, a dialogue about ecclesial and theological questions which sought to extend rather than simply imitate the philosophical precedent of Boethius.

Gerson eventually returned to Lyons, where he took up residence at the Coelestine Priory and completed works of a wide topical range. Among these are several works devoted to epistemological questions, including a treatise exploring the relation of scholastic and mystical theology, *De elucidatione scholastica mysticae theologiae (On the Scholastic Elucidation of Mystical Theology)*, and two works of fifty propositions each, devoted to the epistemological debate between realists of the *via antiqua* and nominalists of the *via moderna*, *De modis significandi (On Modes of Signifying)* and *De concordia metaphysicae cum logica (On the Harmony of Metaphysics and Logic)*. Although he retained his appointment as university chancellor until his death, Gerson never returned to Paris after the council. He died on 12 July 1429, and was buried in the church of St Lawrence at Lyons.

The question of Gerson's philosophical commitments has been much disputed in recent studies. This derives in part from the moderating character of his thought, and in part from developments in his own thinking. The most convincing portrait of Gerson's mature philosophical position remains that offered by Gerhard Ritter (1922), who situates him as a philosophical theologian interested in finding a mediating position that would secure the foundation for a philosophical metaphysics on the basis of a nominalist epistemology. Gerson sought to maintain, according to Ritter, the nominalist distinction of signs and things signified, and identified 'natural reason' as limited to the former. At the same time, Gerson insisted that such signs were not devoid of true signification, and thus metaphysical arguments could hold real epistemological certitude. On the basis of Gerson's strong syncretistic tendencies, Ritter represents him as a conciliatory figure attempting to follow a middle way between the 'modern' heirs of William of Ockham and advocates of an earlier realist tradition.

Such later tendencies are already evident in his earlier program for curricular reform (see for example his letter to Pierre d'Ailly in 1401, in *Oeuvres Complètes* 2: 26-), as in his larger treatise *Contra curiositatem studentium (Against the Curiosity of Scholars)*. In these writings, Gerson avoided theoretical questions by evaluating the legitimate place of *philosophia* in terms of pastoral questions and concerns. Thus he insisted that the *articuli fidei* (articles of faith) were in no way contrary to 'natural reason'; the human pursuit of knowledge should respect certain limited boundaries within which philosophical speculation might legitimately proceed. Such 'natural reasoning' should not, he argued, apply itself through 'vain curiosity' to unedifying questions removed from the actual practice of Christian life, since this often transgressed the boundaries both of reason and of faith and

penetrated the hidden realm of the divine will (*secretum divinae voluntatis*). Rather, one should be guided by humility to accept as sufficient the knowledge gained by scaling the ladder of scripture (*scala scripturarum*), even though one should 'elucidate humbly [through the use of natural reason] the truth of holy scripture within the limits where this is possible' (*Contra curiositatem studentium*, in *Oeuvres Complètes* 3: 233). At stake for Gerson was how to apply reason properly to unfold the revealed truths of faith, in order to strive beyond such knowledge by mounting the 'other ladder' leading toward the 'higher [mystical] knowledge of God' (*Contra curiositatem studentium*: 233).

Later writings, particularly his *De consolatione theologiae*, further develop this argument. Here Gerson insists that the revealed truths of scripture (*articuli fidei*), while not immediately accessible to 'natural reason,' are not on this account irrational. Applying Thomist logic to this question, he suggests that 'just as grace exceeds [but does not destroy or oppose] nature…so does theology surpass philosophy - not by rejecting it but by taking it into servitude' (*De consolatione theologiae*, in *Oeuvres Complètes* 9: 188). Philosophy brings us to the 'summit' of natural reason and its consolations, only to yield to the higher reaches accessible only by theology. Thus *philosophia* for Gerson established a useful but limited prolegomenon for theology, finally directing us toward the 'higher' knowledge of faith revealed in and through the church. On the basis of such a mediating position, it is not surprising to note that the official controversy over nominalism that took place in the later fifteenth century found Parisian nominalists seeking to claim Gerson as an authority endorsing their position, while the official edict condemning this movement did not include him among the 'new doctors' condemned.

Gersonides (1288-1344)

Living all his life in southern France, Levi ben Gershom, known as Gersonides in Latin texts, was an accomplished astronomer and mathematician as well as a philosopher. A prolific and engaged exegete, Gersonides wrote biblical commentaries that are still studied today. His philosophical magnum opus, *Milhamot ha-Shem (The Wars of the Lord), reached original and often unorthodox conclusions regarding many of the great issues of medieval philosophical theology. It denied creation* ex nihilo, *preferring a modified version of the doctrine of* formatio mundi *traditionally ascribed to Plato (formation of the world from pre-existing matter). It qualified traditional doctrines of divine omniscience by denying God's determinate knowledge of future contingent events. And it confined personal immortality to the rational portion of the soul, that is, the intellect.*

1 Life and works

Known in traditional Hebrew sources by the acronym Ralbag (Rabbi Levi ben Gershom), Gersonides was born in Provence and lived there all his life. Besides his philosophical work, he made important contributions to astronomy, mathematics, and biblical exegesis. Both a theorist and an observer in astronomy, he held to the Ptolemic system but rejected the epicycles and other aspects of the medieval Ptolemaic worldview. His commentaries on the Pentateuch, Proverbs, Job, the Former Prophets and several of the smaller Hagiographia are full of philosophy, which he saw as the key to the true understanding of Scripture. He continued the Jewish tradition of writing supercommentaries on Averroes' commentaries on Aristotle, but his original philosophical work, *Milhamot ha-Shem*, written in Hebrew in six books, covers the full range of medieval psychology, metaphysics, philosophy of nature and cosmology. Gersonides was less interested in moral and political philosophy, but his biblical commentaries do reflect on these topics. This essay will consider three of the central issues treated in *Milhamot ha-Shem*: creation, divine knowledge, and immortality.

2 Creation

Creation was a persistent problem in medieval philosophy (see Creation and conservation, religious doctrine of). Both Aristotelians and the Neoplatonists regarded the universe as eternal; yet the Bible and the Qur'an teach creation. Since Gersonides believed that philosophy and the Torah teach the same truth, the apparent disagreement needed to be resolved. His admired philosophical predecessors Averroes (see Ibn Rushd) and Moses Maimonides had taught two contrary theses: Averroes, that the universe is eternal, Maimonides, that it was created *ex nihilo* but that neither the world's creation nor its eternity is demonstrable. Gersonides rejected both views in favour of *formatio mundi*: creation was not bringing something into existence from nothing but the organizing of an eternal, hitherto formless matter. This theory, Gersonides urged, is demonstrable. He devoted the longest part of *Milhamot ha-Shem* to formulating numerous arguments in support of some form of creation. These fall into three distinct groups.

(1) Clearly favouring teleology in metaphysics and cosmology, Gersonides makes the classic argument from design a key proof not just of the existence of God but of creation as he understands it. Anything with teleological properties, he argues, must be the work of a purposive agent - unless it is a chance phenomenon. Focusing on the heavenly bodies, eternal beings for Aristotle (§16), and certainly not chance phenomena in Aristotelian philosophy, Gersonides urges that these do exhibit teleological properties, most plainly in the case of the sun, whose beneficent functioning is obvious. The system and arrangement of the heavenly bodies in general similarly manifest order and design and so show them to be products of purpose and intent, thus, created (*Milhamot ha-Shem*: 6.1, 7 and 9).

(2) Gersonides reinforces this argument with the 'particularization argument' often favoured by Muslim theologians of the *kalam* (see Islamic theology). Aristotle's heavenly bodies all consist of a fifth element (the 'quintessence' of the scholastics). Yet they exhibit diverse properties. Mars, for example, emits a reddish light, whereas Venus has a bluish cast. Aristotle's attempt to explain such properties in terms of distances from the earth fails, since Saturn and Jupiter both emit a whitish light, although Saturn is much further from the earth than Jupiter. Since chance was excluded by Aristotle himself, the observed differences can be explained only by reference to a 'producing agent' (*Milhamot ha-Shem*: 6.1, 8).

(3) Relying on Aristotle's doctrine (*Physics* III 4-8) that an actual infinity is impossible, Gersonides argues, in the style of *kalam*, that the world's eternity would entail an actual infinity. Among his several variations on this long familiar line of argument one is especially interesting, since it is not invalidated by modern astronomy or mathematics: Gersonides argues from our intuition that the past is closed and the future open. Unlike the future, where it is often not determined whether p or ¬p, for all states of affairs in the past it is already the case that p or ¬p; that is, the past is completely determinate. Each fact about the past is real: it is a definite outcome of a preceding state of affairs and has causal consequences, many of which have lasting effects. In this sense the past is always with us. To Gersonides this means that unlike the future, which to a considerable extent is empty, the past is actual. If it were infinite, we would have an actual infinity (*Milhamot ha-Shem*: 6.1, 10-11) (Eternity of the world, medieval views of).

Concluding that the world must be created, Gersonides goes on to argue that its creation cannot be *ex nihilo*. Here he relies on Aristotle's physics and on the fact that familiar cases of generation are always from, or out of, something. He also appeals to the idea that in nature 'like produces like'. Anticipating the critics of Cartesian mind-body interaction, he finds it implausible to say that pure form could bring bodies into being from no pre-existing matter. God, an incorporeal being, could no more create something physical *ex nihilo* than a stallion and a mare could produce a bear.

Defenders of *ex nihilo* creation might not feel troubled by these objections, since creation for them is no ordinary natural event but the 'mother of miracles'. Why should we expect it to conform to the familiar natural laws? But Gersonides goes further. Creation *ex nihilo,* he argues, would entail a vacuum, both before and after the event. And a vacuum, it was widely assumed, was not just a natural but a logical impossibility. In the beginning, according to the adherents of absolute creation, there was only God; then a world was made. If this world was preceded by and subsequently located in empty space - since it is a finite body - then there would inevitably be a vacuum not only prior to the world's creation, but even afterwards, unless the world were infinite in size, a possibility that Aristotle was generally thought to have ruled out (*Physics* IV 7; *On the Heavens* III 2; see *Milhamot ha-Shem*: 6.1, 17-8).

In response to these difficulties, Gersonides adopted the account that medieval thinkers usually thought of as Plato's: the Creator fashioned the universe out of a pre-existing matter (see Plato §16). Although eternal, this matter was not divine. For it was unstable and utterly imperfect, having no intrinsic form or shape. 'Not preserving its shape', it is no competition to God, who is immutable and utterly perfect. Matter is not worthy of worship. It is simply the raw material from which our world was manufactured. It is also the source of all disorder and defect - including moral imperfection (*Perush 'al Sefer Iyyov [Commentary on Job]* - introduction).

Gersonides caps his cosmology by arguing that the universe is indestructible, although generated, contrary to Aristotle, who held that whatever is generated is destroyed (*On the Heavens* I 12). Both Plato and Maimonides had believed the world indestructible, but they ascribed its endurance to God's will (see Plato, *Timaeus* 41a-b; Maimonides, *Guide to the Perplexed* II 27). Gersonides went further, arguing that the cosmos is intrinsically indestructible, since it contains no inherent cause of corruption. God not only would not but could not destroy it; for God would have no reason to destroy what is as perfect as it can be. Once created, then, the world endures forever (*Milhamot ha-Shem*: 6.1, 16).

3 Divine knowledge

Gersonides deviates from familiar views on divine omniscience as well. Ever since Augustine, most medieval thinkers had opted for some kind of compatibilist solution to the venerable difficulties of reconciling divine foreknowledge with human freedom. Not so Gersonides. Embracing the position of the 'philosophers' (that is, Neoplatonic Aristotelians), he concludes that an eternal and incorporeal God cannot know spatio-temporal particulars as such, least of all, future contingent events. If God knew these as particulars, they would lose their contingency. In an argument that anticipates the thinking of recent philosophers, Gersonides preserves human freedom even at the cost of limiting God's knowledge: God knows the general laws governing human behaviour - how humans in general would react to a divine command to kill their only child, and that it is possible for someone to be willing to do so. But God does not know whether Abraham or Jephtha is that person. For humans have the power to act contrary to the biological-psychological generalities of human behaviour, and God knows that these patterns can be broken by human freedom (see Free will; Omniscience).

Gersonides did not regard his solution as a weakening of God’s omniscience, since an omniscient being knows only what is knowable. Future contingent events are not knowable in principle. If they were, they would forfeit their contingency (see Aristotle, *On Interpretation* IX). If it is objected that this means that God lacks knowledge of particulars that even a child might know, Gersonides is ready with an answer: ignorance of spatio-temporal events is not a genuine deficiency in a being who transcends the spatio-temporal order.

Thomas Aquinas admitted that God would not know future events as future but as ‘eternally present’ (*Summa theologiae* Ia.14.13). Gersonides goes further, holding that an eternal being does not know temporal particulars at all. For, as Aristotle claims, genuine knowledge is of the universal (*On the Soul* II 5).

How then can we make sense of the biblical stories in which God speaks to individuals such as Abraham and Moses at specific times? Here Gersonides calls on the aid of the highly regarded twelfth-century biblical exegete, Abraham ibn Ezra, who had reached the same conclusion about divine knowledge. Relying heavily on the traditional hermeneutical liberty to interpret biblical texts so as to reconcile them with philosophical knowledge (*Milhamot ha-Shem*: 3.6), he adapts his reading of Scripture to fit his philosophical conclusions; for example, Bilaam’s donkey didn’t really speak: that incident was just one episode in Bilaam’s prophetic dream. More literal readers of the Bible might find the outcome strained. But Gersonides’ boldness is noteworthy and admirable: he does not allow even the authority of text or tradition to subvert his philosophical conclusions but bends both to accommodate the truth as he believes argument to have shown it.

4 Immortality

Gersonides shows similar independence regarding immortality. By his time the question had become quite focused: what exactly in humans is immortal and how does it become immortal? Within Gersonides’ philosophical orbit the standard reply was that the human intellect becomes immortal through ‘conjunction’, or linkage with the ‘active intellect’. This active intellect was a transcendent, incorporeal cosmic intelligence responsible not only for human intellectual knowledge (including prophecy) but also for informing all things with their objective natures and thus for the governance of biological reproduction and development. The idea of the active intellect stems from a somewhat elusive paragraph in Aristotle’s *On the Soul* (III 5), which speaks of an active intellect that is a precondition of human understanding. In interpreting this passage, Gersonides follows the tradition laid down by Alexander of Aphrodisias (*fl*. *c*.AD 200), who regarded the active intellect as a transcendent and eternal power but the human intellect as a material disposition or capacity of the body, specifically, of the imagination. Other interpreters such as Themistius and Avicenna (see Ibn Sina) believed the human intellect to be an incorporeal substance, inherently capable of immortality. How could Gersonides, as a follower of Alexander’s tradition, account for immortality, if the human intellect was just a biological function and thus susceptible to corruption?

Unlike Alexander or Averroes (whose position is closer to that of Themistius), Gersonides rejected ‘linkage’ with the active intellect. He did not think that we ever reach an intellectual level that would allow so intimate a bond with the transcendent. Besides, the Averroist version of ‘conjunction’ implied the obliteration of individuality: all minds become one in the active intellect. Such loss of identity was objectionable both philosophically and religiously. What Gersonides was seeking was personal immortality.

If the human intellect is only a capacity of the imagination to acquire knowledge, by abstraction from and generalization about sense-data, albeit with the aid of the active intellect, what persists after physical death? Gersonides turns for help to Plato: although the senses are needed initially to acquire the data from which we derive our general concepts, these concepts are grounded not only in the natural world, in the types, or natural kinds, of things, but also in the active intellect itself, which exhibits the ‘rational order’ (a favourite phrase of Gersonides’) of the terrestrial world. Like Plato’s eternal paradigm (*Timaeus* 28-9) the rational order in the active intellect is an everlasting blueprint for the natural world (see Plato §16). In so far as the human mind apprehends, or ‘participates’, in this plan it becomes incorruptible and everlasting. This is the meaning of the expression ‘acquired intellect’ as used in Alexander’s psychology. That intellect in us is the repository of the intellectual capital our minds have accrued. Immortality is achieved not through conjunction with the active intellect but by our individual intellectual efforts and successes. Since what is immortal is our own knowledge, unique to each individual, the immortality we are assured is personal.

5 Conclusion

Although working within a well-defined philosophical tradition that continually tried to show its religious fidelity, Gersonides departed from some of the central doctrines of traditional medieval faith. His loyalty to biblical creation led him to reject Aristotle's notion of the eternity of the universe; but his commitment to Aristotle's physics and metaphysics forced him to reject *creatio ex nihilo* as well. In his theories of divine omniscience and human immortality, he sided with the 'philosophers' more than with the 'theologians'. Yet he did not reject divine omniscience and he worked creatively to sustain individual immortality. His views provoked much controversy, and the *Milhamot ha-Shem* received hostile criticism (notably from Crescas). But Gersonides' biblical commentaries, which often voice his philosophical conclusions, are still studied by traditional Jews. Like Maimonides, Gersonides could think radically and originally, even to the point of heterodoxy, but could win the acceptance of the religious community through a combination of philosophical acumen, biblical and rabbinic erudition, and a life conducted within the norms and traditions of practice of the community.

Gettier problems

The expression 'the Gettier problem' refers to one or another problem exposed by Edmund Gettier when discussing the relation between several examples that he constructed and analyses of knowing advanced by various philosophers, including Plato in the Theatetus. Gettier's examples appear to run counter to these 'standard' or 'traditional' analyses. A few philosophers take this appearance to be deceptive and regard the genuine problem revealed by Gettier to be: 'How can one show that Gettier's examples are not really counterexamples to the standard analyses?' But most philosophers take seriously the problem which is the central concern of this entry: 'How can such standard analyses be altered so that Gettier's cases do not constitute counterexamples to the modified analyses (and without opening the analyses to further objections?)'.

Gettier's short paper spawned many important, ongoing projects in contemporary epistemology - for instance, attempts to add a fourth condition of knowing to the traditional analyses, attempts to replace some conditions of those analyses, such as externalist accounts of knowing or justification (causal theories and reliability theories), and revived interest in scepticism, including an investigation of the deductive closure principle. Difficulties uncovered at each stage of this research have generated an ever more sophisticated set of accounts of knowing and justification, as well as a wealth of examples useful for testing proposed analyses. In spite of the vast literature that Gettier's brief paper elicited, there is still no widespread agreement as to whether the Gettier problem has been solved, nor as to what constitutes the most promising line of research.

1 Gettier-type cases

Clarifying the Gettier problem as most philosophers have seen it ('How can the standard analyses be altered so that Gettier-type cases do not constitute counterexamples to the modified analyses, and without opening the analyses to further objections?') involves clarifying the terms 'a standard analysis' and 'Gettier-type cases'. We may here sidestep concern with the former (but see Shope 1981) by rephrasing the problem as: 'What aspect of a correct analysis of one's knowing that *p* prevents Gettier-type cases from constituting counterexamples to it?' Philosophers who adopt the broadest perspective regard a Gettier-type case as any situation where justified, true believing falls short of knowing. Others are influenced by the manner in which they expect the central problem to be resolved. For example, those who think that the counterexamples in question can be avoided by clauses in a correct analysis ruling out the falsity of specific types of propositions to which the knower is related will characterize Gettier-type cases as situations where knowledge is absent because various propositions are false. Those who hope to avoid the counterexamples by strictures on the durability or degree of justification of one's believing that *p* may prefer to define 'Gettier-type case' by mentioning aspects of such justification. Alternatively, Alvin Plantinga (1993b) suggests that Gettier-type cases involve a slight mismatch between the proper functioning of one's cognitive equipment and one's circumstances.

Approaches to resolving the central problem have been too multifarious for a brief summary. So, setting aside differences over what constitutes an analysis (Shope 1981, and forthcoming), consider how variations on the following important Gettier-type case (Lehrer 1965) impact on a number of prominent attempts to analyse knowing:

Mr Nogot: Somebody in one's office, Mr Nogot, has given evidence, *e*, that completely justifies one in believing that *f*: 'Mr Nogot, who is in the office, owns a Ford'. Evidence *e* consists in such things as Nogot's having been reliable in dealings with one in the past, having just said to one that he owns a Ford, and having just shown legal documents confirming it. From the proposition that *f*, one deduces and thereby comes to believe that *p*: 'Somebody in the office owns a Ford'. Unsuspectedly, Nogot has been lying and it is someone else in the office who happens to own a Ford. One has true, justified belief that *p* but not knowledge that *p*.

This case differs slightly from one of Gettier's original (1963) examples, in which one notices that by picking at random a city name such as 'Barcelona', one can deduce from the unsuspectedly false proposition that *f′*, 'Jones owns a Ford', the conclusion that *p′*, 'Either Jones owns a Ford or Brown is in Barcelona', which one proceeds to believe on the grounds of the proposition that *f′*.

In Gettier's other original example, one justifiably believes the unsuspectedly false proposition that *f″*: 'Jones, who

is not myself, is the man who will get the job, and Jones has ten coins in his pocket', and one sees that it entails that *p*″: 'The man who will get the job has ten coins in his pocket', which one then believes on the grounds of the proposition that *f*″. Unsuspectedly, not only does one have ten coins in one's own pocket, but it is oneself who is going to get the job.

Some variants of the Nogot case do not involve one's having relevant false beliefs. (Indeed, Gettier only spoke of a *proposition* as the basis for one's inferring that *p*′ [that *p*″].) For instance, one may happen to be a clever and cautious reasoner not interested in who owns a Ford but only in whether it is true that *p*, and realizing that someone in the office other than Nogot might happen to own a Ford, one decides that it is safer merely to accept that *p* than to believe that *f* (see Lehrer 1974). Alternatively, Richard Feldman (1974) has noted that one may not arrive at a belief that *p* by relying upon considerations about the proposition that *f*, but instead by utilizing as a basis for believing that *p* the following true existential generalization of one's evidence: 'There is someone in the office who has provided me with evidence *e*'.

2 Defeasibility analyses

Defeasibility analyses of knowing attempt to exploit the insight that specific propositions are true (for example, 'Nogot owns no Ford'), whose hypothetical inclusion in the set of propositions that one believes would have a negative impact either upon the justified status of the belief or upon the justified status of the proposition that *p* (see Knowledge, defeasibility theory of). For instance, Peter Klein (1971) advanced the requirement: 'No proposition is true such that if one were to believe it, then the justification condition would not hold'. We might call such a truth a 'defeater' of *p*. The requirement shows that one fails to know that *p* in the following case:

Tom Grabit's Twin: One is well-acquainted with Tom Grabit, and clearly sees him steal a book from the library. But in consequently coming to believe that *p*, 'Tom stole the book', one does not realize that *t*, 'Tom has an identical twin and that the twin was in the library around the time of the theft'.

Similarly, if in the two variants of the Nogot case mentioned above one were also to have the true belief that not-*f*, then one would not be justified in believing that *p*.

But here we encounter the difficulty of avoiding Gettier-type cases without creating further problems, one such problem being the generation of non-Gettier-type counterexamples. Klein's defeasibility analysis faces this difficulty concerning a variant of the Tom Grabit case as it was originally described by Keith Lehrer and Thomas Paxson (1969) - one indeed knows that *p* but does not realize that *t*: 'Tom's mother has testified to police that *f*: "Tom has an identical twin and was miles away from the library at the time of the theft"', and that *t*′: 'The twin is not real and Mrs Grabit is lying'. If one were merely to come to believe the misleading evidence that *t* without also coming to believe the truth that *t*′, one would not be justified in believing that *p*.

In response, Klein (1981) deepened the defeasibility approach by requiring, roughly, that the combination of a defeater (such as *t*) with *S*'s evidence should not remove *S*'s justification for believing *p*, essentially through justifying *S* in believing a false proposition (such as *f*). But the resulting analysis of knowing is too weak to deal with a variant of the Nogot case in which (1) after coming to believe that *n*: 'Nogot owns a Ford', *S* sees, as luck would have it, a true sentence expressing a disjunction, *d*, which, unsuspected by *S*, is such that any defeater of *n* entails one or another disjunct of *d* that *S* is not presently justified in believing; (2) on the basis of believing that *n*, *S* comes to believe that *p*: '*n* or *d*'; (3) it is true that *n* because Nogot is lucky enough to win a Ford in a raffle while in the company of *S*. Defeaters of *n* fail to be defeaters of *p*, since they support its second disjunct. Yet there need be no other truths that defeat *p*. So Klein does not show why *S* fails to know that *p*.

Perhaps this case of Lucky *S* and Lucky Nogot could be handled by a sufficiently clarified defeasibility condition inspired by John Barker's (1976) concern with the fact that there may be other truths, which, when combined with a defeater of *p* and with *S*'s evidence for *p*, restore *S*'s original justification for believing *p*. (Yet Klein's 1981 work pointed out that restoring evidence may be too easy to come by, for example, exact specifications of nearby lookalikes whose nearness should deny knowledge - such as a real twin in a variant of the Grabit case; see also the case of the Back-Up Volcano in Shope (1981).)

In a sophisticated defeasibility account, Barker's perspective is extended by John Pollock (but in a fashion that may fail to handle the case of Lucky *S* and Lucky Nogot). Pollock (1986) focuses on the justification for the

statement that *p* which is provided by an argument whose premises are drawn from the reasons forming one's basis for believing that *p*. He defines the defeat of such an argument by a set, *S*, of propositions as a situation where: (1) one has the reasons in question and it is logically possible for one to become justified in believing that *p* on the basis of those reasons; and (2) one believes the members of set *S*, where *S* is consistent with the proposition that *p* and is such that it is not logically possible for one to become justified in believing that *p* on the basis of the combination of one's present reasons and the members of *S*. As a condition of one's knowing that *p*, Pollock proposes that the rational presumption in favour of believing that *p* created by reasons drawn from one's present reasons for believing that *p* is undefeated by the set of all truths. Pollock appears to be requiring that the following conditional proposition, *R*, must be true: 'If one were to retain one's present reasons for believing that *p* and were to believe the members of the set of all truths, then one would be justified in believing that *p* on that basis'. Thus, one lacks knowledge in the original Nogot case because of the inclusion of the proposition that Nogot owns no Ford in the set of all truths. In contrast, one succeeds in knowing in the case of the lying Mrs Grabit thanks to the inclusion in the set of all truths of the proposition that *t′* (Plantinga 1993a gives fuller exposition).

Some examples of introspective knowledge are a challenge for defeasibility theories and Pollock (1992) seeks to handle them by treating conditionals as true when they have logically or metaphysically impossible antecedents. For instance, when one knows that *p*: 'I believe that *f*', one's reasons for believing may include the presence of the introspected state, one's believing that *f*. Suppose that one does not realize that it is false that *f*. At least for some instantiations for '*f*', the antecedent of Pollock's conditional involves the impossible situation of retaining one's reason, that is continuing to believe that *f*, while also believing that not-*f* - since the proposition that not-*f* belongs to the set of all truths. (In contrast, Klein needs here to maintain the less-than-obvious claim that *S*'s believing the conjunction 'Not-*f* and *S* believes that *f*' justifies *S*'s believing that *S* believes that *f*.)

But Pollock's treatment of conditionals as being true when they have impossible antecedents opens his analysis to non-Gettier-type counterexamples concerning one's coming to believe that one is in a particular mental state through inference from false beliefs rather than through introspection. On the basis of a justified but imperfect psychological theory, I may justifiably believe the following two propositions that I do not realize are false - f_1: 'Everyone has memories of early childhood', and f_2: 'Everyone who has memories of early childhood believes everyone to have memories of early childhood'. On this basis I come justifiably to believe the true proposition that *b*: 'I believe that f_1'. Pollock's account incorrectly entails my knowing that *b*, since it will be impossible for me to retain my reasons for believing that *b* while adding the true beliefs that not-f_1 and that not-f_2.

3 Causal analyses and proper functioning

The preceding Gettier-type cases involve no causal relationship between one's believing that *p* and the state of affairs that one believes to obtain. So various analyses requiring such specified causal connections have been proposed (see Knowledge, causal theory of). Alternatively, sometimes conditionals have been included in a fourth condition of knowing, relating believing that *p* to what one believes to obtain. For instance, Robert Nozick (1981) initiated a new line of research by requiring that if it were the case that *p* then one would believe that *p*. As it stands, this suggestion faces a difficulty that also affects simple versions of causal theories: these views fail to rule out knowledge in a refinement of another variant of the Nogot case that was devised by Keith Lehrer (1979). Here he imagines that Nogot is manifesting a compulsion to trick people into justifiedly believing truths by concocting Gettierized evidence of type *e* for those truths. Nozick's conditional is satisfied if we add the details that: (1) Mr Nogot's neurosis is highly specific to the type of information contained in the proposition that *p*; (2) his compulsion is not easily changed; (3) while in the office he has no other easy trick of the relevant type to play on one; and (4) one arrives at one's belief that *p* not by reasoning through false beliefs but by basing the belief that *p* on a true existential generalization of one's evidence (Shope 1992).

Further variations on the case of tricky Mr Nogot challenge Alvin Plantinga's (1993b) proposal that one's knowing that *p* requires not only that one have a true, justified, sufficiently strong belief that *p*, but that one also meets the following requirements: (*1*) the cognitive faculties involved in the production of one's belief are functioning properly in an environment sufficiently similar to the one for which they were designed; (*2*) the portion of one's design plan covering formation of beliefs when in the latter circumstances specifies that such formation directly serves the function of forming true beliefs; (*3*) if those circumstances include additional beliefs or testimony, then

the latter are or express beliefs also satisfying (*2*) - and so on, backwards through any chain of input beliefs or testimony from one person to another; (*4*) there is a high statistical or objective probability that a belief produced in accordance with that portion of one's design plan in one's type of circumstances is true.

Plantinga notes that the original Nogot case involves credulity, that is believing for the most part what one's fellows tell one. When Nogot says that he owns a Ford, credulity helps to produce one's false belief that *f*, which serves as further input to one's belief-forming faculties so as to generate the true belief that *p*. Plantinga suggests that credulity was designed to function in circumstances where testimony from our fellows does not deceive us and is intended to produce true beliefs in us. Both of the latter circumstances are absent when Nogot brags about his Ford and one comes to believe that *f*.

But in the case of tricky Mr Nogot the informant does intend to produce a true belief in one. Of course, the case does not satisfy (*4*), since it is likely that one will not only believe that *p*, but also believe that *f*. So consider instead a variant of the case where one is in addition a clever and cautious reasoner of the type described earlier, highly likely to avoid believing that *f*, and suppose that Nogot realizes this. He then takes no significant risk of one's forming a false belief.

The example may violate (*3*) if the purpose specified in the design plan for the use of testimony is to induce or sustain belief on the part of another *in what the testifier says*. But Plantinga admits that Nogot provides a wide variety of evidence that supports both the proposition that *f* and the proposition that *p*. So the Nogot case can be altered by imagining that he provides a large quantity of evidence involving no false testimony. Then it is obscure how Plantinga can show that tricky Mr Nogot is providing evidence for a non-designed purpose, since evidence never supports only one proposition, and we rarely, if ever, come to believe everything for which we have evidence.

Suppose that Plantinga is defended by the suggestion that the circumstances in which one's relevant cognitive faculties were designed to operate exclude the type found when tricky Mr Nogot meets the clever reasoner. This response exposes a 'generality problem' in Plantinga's account: what level of generality is relevant to specifying the circumstances pertinent to conditions (*2*), (*3*) and (*4*)? Plantinga rejects the possibility of a naturalistic account of proper function, and focuses attention on what a theistic God would have in mind when designing us in his image, part of which would involve our powers as knowers being analogous to God's in so far as he has beliefs that are true and he, although not designed, fulfils a specification that is an ideal for cognitive design plans, namely, to believe that *p* if and only if it is true that *p*. So what does it matter that a neurosis is what motivates the way in which evidence is provided by tricky Mr Nogot, since true beliefs are ensured?

In any event, Plantinga's requirements are too weak to deal with the following variant of the original Nogot case: Nogot is entirely sincere but his Ford has, unknown to everyone in the office, been repossessed or destroyed by a meteorite since he parked it. Requirement (*3*) implies that when one's belief depends upon a chain of testimony, then at each stage the input propositions must have the right kind of credentials, namely, being a belief that has warrant for the testifier. But the sincere Nogot would have warrant for believing the truth that *f* in a variant of the above case where nothing untoward happens to his Ford. So it is difficult to see how the repossession or meteorite strike removes such warrant in the former case. (Moreover, the case of unlucky, sincere Mr Nogot could also be varied so as not to include any false testimonial evidence.)

4 The role of false propositions

Solutions concerning the role of false propositions continue to intrigue researchers. Roderick Chisholm (1966) requires that when one knows that *p*, something makes *p* evident for one without making any falsehood evident for one - unless the proposition that *p* is a conjunction (for example, 'Nogot is in the office and has presented *e*'), in which case Chisholm also requires that there is something that makes any given conjunct evident for one without making any falsehood evident for one. But the physicist Millikan, who mistakenly accepted the false statement that the charge of the electron was a certain value, did at least know that the value was very, very close to the one that he picked. Anything that made the latter proposition evident for Millikan also made the former falsehood evident for him (Plantinga 1993a provides other counterexamples).

Another solution of the Gettier problem that concerns the exclusion of falsehoods requires that one's believing that *p* be justified through one's grasping enough of a 'justification-explaining chain' - a specific type of structure of

justified propositions concerning what explains the justification of other members without including falsehoods at certain locations (see Shope 1981). The rationale for such a requirement is that fully satisfactory explanations avoid crucial reliance on falsehoods. We must acknowledge and analyse a broader category of knowing that *p* than the narrower, debate-oriented species of concern in a standard analysis, a genus that grants some knowledge to infants and perhaps even to some brutes. Then we may say that: (1) grasping a proposition within a justification-explaining chain, for example, the proposition that *h*, is having knowledge that *h* belonging to the broad category; and (2) the amount of the chain that one must grasp in this way in order to have knowledge that *p* belonging to the narrow category is an amount that suffices for having knowledge that *p* belonging to the broad category (see Shope forthcoming).

Geulincx, Arnold (1624-69)

Rediscovered in the middle of the nineteenth century, for a long time it was only because of his relation with other more conspicuous philosophers, such as Spinoza, Leibniz and Kant, that interest in Geulincx arose. It has since become clear that he was an original thinker in his own right, who proposed an intriguing metaphysics and made interesting contributions to logic.

1 Life and works

Arnold Geulincx was born in Belgium at Antwerp. In 1641 he matriculated at Louvain, where he became a professor of philosophy in 1646. For reasons that are not clear but were probably of a religious nature (at Catholic Louvain there was much sensitivity over Jansenism), he was suspended from his duties and subsequently dismissed in 1657/8. He moved to Leiden and converted to Calvinism. After taking a degree in medicine he obtained permission to lecture on philosophy, but his position was regularized only in 1662 when he was appointed reader in logic. He became professor ‘extra ordinem’ in 1665, but died in 1669 from the plague. Most of his works, dealing with logic, moral philosophy, physics and metaphysics, were published posthumously.

2 Logic

Although the main merits of Geulincx’s works on logic seem to be their elegance and precision, Dürr and Nuchelmans have shown that he made some important steps towards a logic of propositions. According to him, words like *est* and *non* are signs (*notae*) by which to indicate the mental act performed with respect to a particular content. Every denial is the negation of an affirmative claim, and that means that an affirmation has been present to the mind (*affirmatio inclusa*). Accordingly, ‘Peter is not learned’ must be interpreted as ‘It is not the case that Peter is learned’, or also as ‘The sentence "Peter is learned" is false’. Speaking of compound conditional sentences, Geulincx defines an antecedent as a statement which says that the whole of that which some other statement (the consequent) says to be the case is indeed the case. Consequence is a form of containment (*continentia*): between two statements *A* and *B* there obtains a relation of consequence if *A* says the dictum of *B*. Both the theory of containment and the theorem that every *A* implies the statement ‘*A* is true’ are corollaries of the idea put forward by Geulincx that by making a statement one commits oneself to the truth of that statement and of everything entailed by that statement. For example, if one says ‘I am standing’, this must be taken as an affirmation of whatever is entailed by that statement, such as, for example, ‘I am capable of standing’. Accordingly ‘I am standing’ serves as the antecedent of any number of other statements to the truth of which we commit ourselves (see Conditionals; Propositional logic).

3 Metaphysics and moral philosophy

According to Geulincx, metaphysics is first philosophy or first science. It deals with the human subject, body and God, each of which are the object of a separate science: autologia, somatologia and theologia. The autologia consists in an exploration of the Cartesian *Cogito*, which, however, Geulincx does not see as the basic principle of his philosophy but, rather, as a way to gain access to the realm of necessary truths (see Descartes, R. §5). In fact, the more fundamental principle is the axiom that we can truly be said to make or do something only if we know how it is made or done (*quod nescis quomodo fiat id non facis*). This axiom allows Geulincx to claim that we are passive spectators of the world, our only activities being to will and think, albeit in a purely immanent way. Indeed, the world cannot be the cause of our seeing and perceiving: since it can neither think nor know anything, it cannot be active. The only true cause is God and the only truly causal relation is that between God and the world. In fact, all philosophy should begin with the concept of God; we have to start with the *Cogito* only because the Fall has obscured our faculties. The result of Geulincx’s analysis is that God is Being simpliciter as well as Mind simpliciter. This implies not only that all reality is ultimately mental but also that whatever is neither God nor part of God is nothing but an appearance. In fact, there are only two things that really exist: Mind, which is the creator, and Body, which is the created. Our minds are parts of the Divine mind. Our bodies are part of a phenomenal world. Particular three-dimensional bodies can be understood as limitations of the archetypal Extension that was produced in the act of creation. However, that there is a world extended in three dimensions can be known through the sensations God causes us to have. Finally, since contingent facts cannot be accounted for by principles of metaphysics (which explain only what is necessary), physics makes use of ‘hypotheses’. These must consist of

clear and distinct ideas which together with the principles of metaphysics must be sufficient to explain all phenomena (see Persons; God, concepts of).

Like his metaphysics, Geulincx's moral philosophy is based on a corollary of his fundamental axiom, namely, that where there is no possibility to act there can be no will either (*ubi nihil vales, ibi etiam nihil velis*). In whatever way we act, it is God that makes us act in that particular way. Accordingly, virtue is not to act in a particular way but to yield internally to God's will. Morality lies in the intention, not in the act. As a result, the cardinal virtues are dispositions: diligence, obedience, justice and, above all, humility. Passions on the other hand are like sense impressions. Although they belong to human nature, they are relevant only in so far as they prevent us from developing the right attitude towards God's will. The most dangerous passion in this respect is self-love. In any case, the reward of virtue is that, freed from self-love, we enjoy peace and tranquillity in this life.

4 Relation to other thinkers

Although much in Geulincx's philosophy goes back to Descartes, it would probably be wrong to call him a Cartesian. For not only are the various parts of his philosophy differently connected, his metaphysics is crowned by his moral philosophy, not by his physics, which is basically an attempt to provide a metaphysical account of Divine Creation. Accordingly, his philosophy has more affinity with Malebranche, with whom Geulincx shares a basically occasionalist interpretation of causality (see Malebranche, N. §4). There is also some similarity with Spinoza's philosophy - except, of course, that Spinoza rejects the idea of creation (see Spinoza, B. de §4). In fact, Geulincx's starting point is fundamentally different. Whereas Spinoza argues that on the basis of Cartesian metaphysics it is impossible to account for creation, Geulincx takes creation to be a fact and attempts to make sense of it in terms of Cartesian metaphysics. However, the only way to do this is, he believes, to assume that creation consists in producing a world of appearance. Geulincx's physics is also different from that of Descartes, not because it would involve different concepts but because they understand the status of concepts differently: concepts are 'hypotheses' which, even if clear and distinct, are not automatically and necessarily true. This doctrine, which involves an interplay of empirical and metaphysical principles, has often been associated with Kant's theory of judgment (Cassirer 1911, De Vleeschauwer), but this is somewhat far fetched (see Kant, I. §7). The best characterization seems to be that he is a Christian philosopher trying to find his way in the world of post-Aristotelian philosophy and availing himself of the language and concepts of his contemporaries to provide an intelligible account of the mysteries of faith.

THEO VERBEEK

List of works

Geulincx, A. (1891-3) *Opera philosophica*, ed. J.P.N. Land, The Hague: Martinus Nijhoff, 3 vols; repr. with some additions, *Sämtliche Schriften*, ed. H.J. De Vleeschauwer, Stuttgart Bad Canstatt: Frommann, 1965-8, 3 vols.

Geulincx, A. (1653) *Quaestiones quodlibeticae*, Antwerp; repr. Leiden, 1665; repr. *Opera philosophica/Sämtliche Schriften*, vol. 1, 67-147.

Gilbert of Poitiers (*c*.1085-1154)

Gilbert's most important work is his commentary on the theological treatises of Boethius. His contemporaries valued him not only as a theologian but also as a philosopher, especially as a logician. Their estimation was well-founded. Although today we possess only theological writings from his own hand, these allow us to reconstruct a body of rich and independent philosophical thought.

The most salient characteristic of Gilbert's thought is the precise, analytical reflection that he brought to bear on the linguistic and conceptual means by which we think about whatever exists. In Gilbert's thought, two things go hand in hand: a philosophy of the concrete and the particular and an intellectual viewpoint whose conceptual resources are manifestly Platonist. In the history of philosophy, these two things are not usually found together.

1 Life

Gilbert of Poitiers, named after the city of his birth, studied in Chartres and Laon and then taught theology in Chartres and in Paris. In 1142 he was made Bishop of Poitiers. At two Councils he had to defend his doctrine of the Trinity against charges of heresy. In both cases his learning, power of argumentation and self-assured presence were convincing, and his defence succeeded. He died, highly respected, in 1154 (see Chartres, School of).

Gilbert's influence survived for some time after his death, thanks to the efforts of his students. The school he founded (named apparently after the Porretain quarter in Paris, in which it was located, rather than after Gilbert himself) survived well into the second half of the twelfth century, teaching grammar, logic and theology according to the philosophical methods and concepts that Gilbert had introduced.

2 The multiformity of being

At the foundation of Gilbert's whole ontology lies the distinction between 'that which is' (*quod est*) and 'that through which a particular thing is' (*quo est*). Corresponding to this distinction, there are different kinds of linguistic expression. 'That which is' is referred to and described by concrete terms (such as 'human being', 'bodily, body', 'colourful, the coloured'). Every concrete term in turn has a correlated abstract term (such as 'humanity', 'corporeity', 'colour'). The abstract term designates 'forms', or determinations of that which is. Thus every being can be referred to and described in many different ways. Gilbert construes this fact as meaning that one can see each being as a concretion of many formal determinations; any being is multiform, in that it is constituted by a plurality of formal determinations. Conversely, forms are real only through their concretion; they have no independent existence.

Among the forms that determine any being, there are some that determine a given being with respect to its essence. These make up 'the being of something with respect to what it is' (*esse aliquid in eo quod quid est*) (Commentary on Boethius' *De hebdomadibus* 1, nn. 46-7, 11.255-62). Other forms also make a being be something particular, but they determine the being only with respect to some non-essential property (*esse aliquid tantum*), not with respect to what it is. Gilbert calls a being, considered with regard to its essential determinations, 'a subsistent something' (*subsistens*), and he calls these formal determinations 'subsistences' (*subsistentiae*), belonging to the subsistent something. Every subsistent something has several subsistences, for everything determines a being essentially that belongs to its definition or to the further explanation of a determination referred to in the definition. For each being, it is the task of the natural sciences to discern correctly the boundaries between the determinations belonging to the being's definition and those having to do with its merely accidental properties. The criterion for making this decision between the ways that a form determines a being is the regularity with which a given being has certain properties (*consuetudo rerum*). It is generally possible that some formal determination that is a subsistence in relation to one being is accidental in relation to another.

Gilbert distinguishes sharply between designations or descriptions that apply to something in and of itself, and those that characterize it in comparison with something else. Aside from the subsistences of a thing, only its qualitative and quantitative determinations pertain to the thing's own being. Determinations of space, time and position, as well as determinations of how a thing acts or is affected and of what a thing possesses, always characterize a thing in relation to other things. Such determinations are relational, pertaining to the circumstances in which a thing exists.

3 The individual

Anything that subsists is a singular thing (*singulare*); and every subsistence, and every quality and quantity, is also single. Any single entity is different from every other. Gilbert adheres to this proposition closely. When one and the same subsistence, or one and the same property, belongs to different things, then these things are 'the same in form' (*conformes*) with regard to each subsistence or property: but the form, considered as the form of some one thing, is different from the form of some other thing even though it is the same in content. Every human being is a human being through its own humanity; every white thing is white through its own whiteness.

In Gilbert's view, the singularity of form is the basis of the singularity of that which is formed by it (Commentary on Boethius' *De trinitate* I, 5, n. 23, 1.162). Consequently, when Gilbert considers what individuality consists in, he takes forms, not what is formed, as his starting point. Formal determinations are either simple or complex (for example, humanity is complex compared with being rational since rationality is a conceptual element of humanity.) All simple formal determinations are suited to determine equally a number of subsistent things. Gilbert calls such forms 'divisible among many' (*dividua*). If two things *a* and *b* are the same in form with respect to the form *F*, then *F* is 'divisible' with respect to *a* and *b* (and probably with respect to other things as well). A complex formal determination could be represented by a conjunction of expressions standing for single forms (*F* and *G* and…) or, considered as the form of *a*, by the conjunction (*F(a)* and *G(a)* and…). Such a formal complex remains divisible as long as it can be completed by further formal elements and, while it is not complete, the complex taken as a whole could apply to other things. However, the complete formal determination, to which nothing further can be added, is not divisible. With respect to it, no two things are the same in form. Formal determination is thus the basis of individuality: an individual, determined in every respect by its complete form, may be similar to other individuals in many ways, but as a whole it is dissimilar from every other individual.

Finite reason can never grasp the individuality of an individual with regard to its content, because finite reason is discursive (that is, it proceeds by joining together partial determinations of things). Any content attainable by finite reason is always partial and therefore 'divisible'. When we want to refer unmistakably to precisely one individual, we have surrogates of complete understanding, such as dating and locating. But individuals are not individuated by their place in space and time; rather, they are individuated by their complete form. The complete form is inherently unrepeatable, and thus individual things are unrepeatable. This proposition is indemonstrable; it is a first principle of Gilbert's ontology.

4 Theory of knowledge

Gilbert distinguishes three branches of theoretical knowledge: physics, mathematics, and theology. This distinction is common in medieval philosophy. Its ultimate derivation is from Aristotle's *Metaphysics*, Book E, recalled by Boethius in the first of his treatises on the Trinity. However, in the twelfth century, at the time that Gilbert was commenting on Boethius, Aristotle's *Metaphysics* itself was not yet known in the West.

In his interpretation of the distinction, Gilbert arrives at a special understanding of the three sorts of theoretical knowledge. His first step is to take up objects of knowledge. We consider objects that are either concrete or abstract, and we consider what is abstract when we consider the first principles of all being in their simple being in themselves. Gilbert often speaks of unformed matter and of form which is not the form of some matter as principles. For Gilbert, however, there is ultimately just a single 'separated' first principle of being, God. Theology is the science whose object is the non-concrete.

Gilbert's second step is to take up different ways of knowing. That which is concrete can be considered either as it is, or in an abstract way (*abstractim*) when we attend only to forms, disregarding matter. The first way Gilbert calls 'natural consideration', the second he calls 'mathematical consideration' (or sometimes also *mathesis* or *disciplina*). It should be noted that *mathesis* concerns not quantities but abstracted forms.

The first way of knowing considers natural things in a 'natural' way and describes things as they present themselves in experience. What is concrete is complex and multiform; its formal aspects are understood as they are found in their concretion. This is reflected in the language of natural science. In its statements, which are descriptive, there are concrete terms in both subject position and predicate position, though a predicate term can be filled out by an abstract term in the ablative case (for example, 'Socrates is a human being *on account of*

humanity', or 'something is white *on account of whiteness*').

Mathesis does not have its own sphere of objects, separable with regard to content from the objects of natural science. *Mathesis* is special because it is a certain way of knowing, consisting in conceptual analysis. Its inquiry concerns the meaning of concepts such as corporeity or life. Thus concepts of forms are freed from the concrete state of affairs with which they are connected. *Mathesis* concerns itself with the question of what other concepts are implied by the range of meaning of a certain concept: with what other concepts is a given concept compatible or incompatible? It is mathematical rather than natural consideration of objects that leads to general concepts under which other concepts are ordered. Ultimately, such consideration leads to the Aristotelian categories. Gilbert emphasizes explicitly that the categories are referred to more adequately by abstract than by concrete terms (Commentary on Boethius' *De trinitate* I, 4, nn. 7-21).

Natural and mathematical consideration must not be mixed together. Nor must concrete and abstract terms be mixed together in statements, for instance, by putting a concrete term in subject position and an abstract term in predicate position or vice versa. The descriptive consideration *of things* and the consideration that develops theories *about the concepts of forms* are different and complementary.

5 The nature of theological discourse

Theological discourse is reflective and has no special language appropriate to it. We put together statements using concrete or abstract terms, but none of these statements conveys God's simplicity (see Simplicity, divine). This inappropriateness is something about which the theologian or metaphysician thinks, but he cannot make statements that are in fact appropriate to the object under consideration.

From Gilbert's writings, we can infer a methodology of speculative theology. This methodology consists in precisely regulated transpositions (*transsumptio*) of ways of using expressions and making statements. The ways of using expressions and making statements cannot themselves be altered, for we cannot speak in any other ways than those resulting from natural or mathematical consideration, using concrete and abstract terms. Gilbert's theory of transpositions is a theory about the sort of altered sense that statements of an ordinary form must be understood as having when they are used in theological discourse. One of the first transpositions is that of word meaning. The predicate 'is powerful' has a different meaning when applied to God than when applied to a king. When God is said to be just, this is not to be understood as a determination of a quality; nor, when God is said to be greatest, is this to be understood as the determination of a quantity (Commentary on Boethius' *De trinitate* I, 4, n. 28, 11.161-9).

More important is the transposition of the meaning of predication. Ordinarily, when we say of something that it is, or that it is powerful, or that it is wise, we are making very different statements. Recourse to the abstract concepts of existence, reality, power or wisdom serves to make clear the differences between these formal determinations. However, God must not be thought of as multiform. When it is said of God that he exists, or is powerful, or is wise, these statements are just various approximations - from the human standpoint - regarding the being who is simple. Every statement about God must be understood as expressing its object as a whole. Whereas ordinarily we must understand and evaluate the statements that we made about something separately (*divisive*), in theology we must understand all statements as conjoined and interrelated (*coniuncte et copulate*), in other words, in such a way that each statement is thought of as including all other statements (Commentary on Boethius' *De trinitate* I, 4, nn. 37-48).

When reflecting on the inappropriateness of our talk about God, Gilbert occasionally makes statements of the following form, which he otherwise rejects: 'God is not powerful but rather power itself'. It is a mistake to think that in statements of this form, one has discovered the special language appropriate to theological discourse. Such statements are only admissible in the development of theological inquiry, arising as our thought about God corrects itself, and should not be taken as fixed results of theological consideration. Abstract terms ordinarily are indications of a possible conformity among beings; but there is no conformity between God and anything else.

Gilbert sees theology as a reflection on that which is primordial, that is, as providing a theory of first principles. However, such a theory must also teach us to see that which has come into being (that which derives from first principles) in a new light. The path of human thought leads from what has come into being to what is primordial, and it also leads back again, connecting our consideration of the primordial to our concepts of what has come into

being. Although the primordial is incomprehensible, our thinking about it changes our understanding of what has come into being.

In Gilbert's view, there is not just one transposition; there is also another, complementary transposition leading from thought about God to a new understanding of the natural world. Gilbert demonstrates this reversal of the direction of transposition in the case of the predicate 'good'. He explains that the proposition that every being is good insofar as it is a being lies beyond any natural consideration, springing instead from theology. Because God is good insofar as he is, everything created by him is good. In its primary sense, therefore, 'is good' is predicated of God, and when we say of a creature that it is good, we are using a derivative designation (*denominatio*) (Commentary on Boethius' *De hebdomadibus* 2, nn. 150-6).

It is clear that construing the predicate 'is good' along these lines is not just an *ad hoc* idea, for Gilbert interprets each of the axioms that Boethius presents in his treatise *De hebdomadibus* in two ways (with the exception of the axiom concerning simplicity, which can only be understood theologically). Thus being (*id quod est*) should be treated in the following two ways: theologically speaking, God is the being of everything; ontologically speaking, the totality of its subsistences is the being of each existent thing. Theologically speaking, then, God alone is, in the full sense of the word 'is'. Each particular thing is just that particular thing, and is not something else that also is. Given the historical context, it is surprising that in his theological works Gilbert construes the Boethian axioms ontologically as well as theologically. Indeed, Gilbert apparently takes special interest in the ontological interpretation, one which is clearly not demanded by Boethius' text. From a philosophical perspective, the converse is equally noteworthy: in Gilbert's view, to speak of the being of natural beings is to speak of 'being' and 'beings' in respect of a certain derivative designation (*denominatio*).

Giles of Rome (*c*.1243/7-1316)

Giles of Rome was one of the most eminent theologians and commentators on the works of Aristotle at the University of Paris in the second half of the thirteenth century. He was probably a pupil of Thomas Aquinas, who exerted a deep influence on Giles' metaphysical and theological thought. Giles' reception of Aquinas' positions, however, was often critical and original.

*For historians of medieval philosophy, Giles' name is mainly associated with the doctrine of 'the real distinction' between essence (*essentia*) and existence (*esse*). According to this doctrine, essence and existence are two completely distinct things (*res*) of which the ontological structure of every created being is composed. On the issue of the relationship between essence and existence Giles took a firm position against his contemporary Henry of Ghent, who maintained that existence is a mere relation of the essence of a created being to its creator. Giles was also involved in the debate over the unity of the substantial form in composite substances, another burning issue in the thirteenth century. As a commentator on Aristotle's works, Giles made original contributions to the tradition of Aristotelian natural philosophy, especially in his treatment of extension, place, time and motion in a vacuum.*

1 Life

Giles of Rome was born, probably in Rome, in the fifth decade of the thirteenth century. It seems that he entered the Augustinian Order at Rome. In order to study philosophy and theology he was sent to Paris, where he probably attended Thomas Aquinas' lectures during the years 1269-72. Giles started his academic carrier as a bachelor of theology at the university of Paris around 1270, and in the period between 1270 and 1277 he lectured on the four books of the *Sentences* by Peter Lombard and wrote most of his commentaries on Aristotle's works.

In 1277 he was one of those whose views were attacked in the condemnation of heterodox Aristotelianism initiated by the bishop of Paris, Etienne Tempier (see Aristotelianism, medieval). Three main reasons for Giles' condemnation have been detected: first, the similarities between some of his doctrinal positions and those of the masters of arts who were the principal targets of the condemnation (for example, Siger of Brabant); second, his critical attitude towards some masters of theology, especially Henry of Ghent; and third, his defence of some Thomist positions, such as those about the unity of the substantial form and the possibility of an eternal world (see Aquinas, T.; Eternity of the world, medieval views of). As a reaction against the condemnation, he wrote the sharply polemic treatise *Contra gradus et pluralitatem formarum (Against the Degrees and Plurality of Forms)*, in which he argued that the doctrine of the unity of substantial form is not only sound but also the only one in agreement with faith.

Little is known about Giles' activity in the years immediately after 1277. He probably left Paris and returned to Italy. During this period he wrote the *De regimine principum (On the Governance of Princes)*, dedicated to the future French king Philip the Fair, whose tutor he is said to have been, possibly in the period between 1277/8 and 1281.

In 1285 Giles returned to Paris, where he was appointed master of theology. His activity in this position is mainly represented by six *Quodlibeta* discussed between 1286 and 1291 and by several collections of *Quaestiones disputatae (Disputed Questions)*. The most heated phase of Giles' polemic against Henry of Ghent on the issue of the distinction between essence and existence also dates to this period. In 1287 his teachings became the official doctrine of the Augustinian Order, of which he was elected prior general in 1292.

In 1295, Pope Boniface VIII appointed Giles archbishop of Bourges. He took an active part in the ecclesiastical life of that period. On the occasion of the controversy over the legitimacy of Boniface VIII's election, Giles wrote the *De renuntiatione papae (On the Abdication of the Pope)*, in which he took the pope's side. In connection with the conflict between Boniface VIII and Philip the Fair, he wrote the *De ecclesiastica potestate (On the Ecclesiastical Power)*, a work which exerted a strong influence on the pope. Giles died in Avignon on 22 December 1316.

2 Metaphysics

Giles' philosophical and theological thought is much influenced by the writings of Aquinas, but his views do not faithfully express those of Aquinas. On the contrary, Giles often criticizes Aquinas' positions, although in most cases his criticisms aim at correcting and integrating Aquinas' doctrines rather than rejecting them completely. Furthermore, Giles' methodological approach to philosophical problems is not the same as that of Aquinas. Giles pays more attention to the logical structure of argumentation and linguistic analysis, and also tries to formulate more general solutions.

Giles' metaphysics is mainly characterized by two doctrines: the real distinction between essence and existence and the unity of the substantial form. As to the first doctrine, although Giles finds a distinction between essence and existence in Aquinas' writings, he is particularly original in his interpretation of this distinction. Indeed, Giles' view on this topic is much more clear-cut and radical than that of Aquinas, for he maintains that essence and existence are two completely distinct things (*res*), of which the ontological structure of any created being is composed. According to Giles, in order to account for the passage of an entity from potentially existing to actually existing, it is necessary to regard existence as a *res* which is added to the essence of this entity. On the basis of this account of coming into being, Giles strongly criticizes and rejects Henry of Ghent's notion of existence as a mere relation of the created essence to the creator. Despite Giles' refusal to identify existence with an accidental form, the essence-existence relationship in his treatment of it turns out to be very similar to the Aristotelian substance-accident relationship (see Aristotle). This implies in particular that essence is ontologically prior to existence. In this respect, Giles' position is closer to an Avicennian than to a Thomist position (see Existence; Ibn Sina).

Giles' position on the issue of the unity of the substantial form is not perfectly uniform. In the *Errores philosophorum (Errors of the Philosophers)* he criticizes Aristotle's theory of the unity of the substantial form in every composite substance (however, Giles' authorship is not certain). On the contrary, in the *Contra gradus et pluralitatem formarum* he denies the plurality of forms in any composite. In his later writings, however, he seems to be more concerned with the theological implications of the doctrine as applied to the human being, and adopts a more prudent view, holding that there is only one substantial form in any composite with the exception of the human being, and leaving the question open in this latter case.

The nature of individuation is another important topic in Giles' metaphysics. Following Aquinas, he maintains that prime matter is pure potentiality and that therefore a quantitative principle must be added to matter in order to account for the multiplication of the substantial form. This quantitative principle is described by Giles in terms of Averroes' notion of indefinite dimension (*dimensio indeterminata*), where the adjective 'indefinite' reflects the fact that this dimension exists in matter prior to the substantial form (see Ibn Rushd). In replying to some objections against the priority of extension over substance resulting from his account of individuation, Giles specifies that the principle of individuation is not quantity conceived of as a thing distinct from matter, but a quantitative mode (*modus quantitativus*) of being which indefinite dimensions confer upon matter (see Matter).

3 Theory of soul and of knowledge

Giles' psychology and epistemology reflect mainly Aristotelian and Thomistic principles, with no special inclinations towards Augustinian or Averroistic positions. As to the theory of soul, for instance, Giles follows Aquinas' view on the real distinction between the soul and its faculties. In theory of knowledge, Giles emphasizes the Aristotelian principle that any knowledge starts from sense experience. Accordingly, he rejects the Platonic theory of innate ideas as well as the Augustinian theory of illumination (see Augustinianism; Platonism, medieval). While the starting point of intellectual knowledge is the sensory cognition of sensible substances, its proper object is the immaterial quiddity of these substances. Therefore, intellectual knowledge also requires a process of abstraction from material conditions, in which, according to Giles, both the agent intellect (*intellectus agens*) and an intelligible species (*species intelligibilis*) play an essential role (see Knowledge, concept of).

As to the theory of truth, while in Aquinas both the Augustinian-Anselmian and the Aristotelian traditions are combined, Giles firmly adopts the latter. That is, he maintains that truth is not a property inhering in extra-mental things independently of any cognitive act, but a correspondence between these things and the propositions formed by the intellect (*adaequatio intellectus et rei*).

Regarding the issue of the unicity of the intellect, Giles strongly rejects both the doctrine of the unicity of the agent

intellect, which he ascribes to Avicenna (see Ibn Sina §3) and the Averroistic doctrine of the unity of the possible intellect (see Averroism) In Giles' view, individual knowledge and the ontological status of the intellect as an intermediate entity between material and immaterial forms can be accounted for only if rational soul is the form of the body and is multiplied by inhering in different bodies.

4 Natural philosophy

Giles' natural philosophy is still basically Aristotelian. His most systematic and extensive treatment of physical concepts is contained in his commentary on Aristotle's *Physics*, which was widely used by later commentators. In addition to a careful exegesis of Aristotle's text, Giles also presents original positions on some of the fundamental issues of Aristotelian natural philosophy, as for instance extension, place, time and the eternity of the world.

In order to account for the processes of condensation and rarefaction, Giles postulates the existence of two independent quantities inhering in a physical body: the corporeal dimensions, which vary when the body is condensed or rarefied, and the quantity of matter (*quantitas materiae*), which does not vary. This distinction has strong similarities to the modern distinction between volume and mass.

Giles also distinguishes between material place (*locus materialiter*) and formal place (*locus formaliter*). Material place is place in the Aristotelian sense, that is, the inner surface of the containing body. Formal place is an order (*ordo*) or a distance (*distantia*) between the located body and the fixed points of the universe. Following Aquinas, Giles introduces the notion of formal place in order to account for the immobility of place, but he departs from Aquinas regarding the relationship between material place and formal place. In Giles' view, formal place is not a property of material place, but something independent of it. His motivation for separating formal from material place is to be found in the distinction between two roles that the notion of place must play: first, a principle of delimitation of the extension of the located body; and second, a frame of reference for describing the body's motion and rest. The first requirement is adequately met by material place, the second by formal place.

Although Giles agrees with most of Aristotle's presuppositions about time, he also admits the simultaneous existence of many temporal durations and the existence of a discrete time, that is, of a succession of instants conceived of as temporal atoms rather than as mere cuts in a temporal continuum, whereas Aristotle holds that there is just one time and that it is a continuum. In particular, the notion of a discrete time plays an important role in Giles' treatment of motion in the void, since he argues that such a motion would not take place instantaneously, as Aristotle and Averroes claim, but in a succession of instants, that is, in a discrete time.

On the issue of the eternity of the world, in his early writings Giles follows a Thomistic position. On the one hand, he claims that Aristotle's and Averroes' arguments for an eternal world are not conclusive, since they falsely assume that any production involves motion; on the other hand, however, he admits that an eternal world is at least theoretically possible. After the condemnation of 1277, Giles takes a more moderate position, according to which it is theoretically possible to prove that the world had a temporal beginning, although adequate arguments for this conclusion have not yet been proposed (see Eternity of the world, medieval views of; Natural philosophy, medieval).

5 Theology

Giles' conception of God centres on the notion of divine unity, which he regards as the primary divine attribute. The priority of divine unity is particularly evident in his approach to trinitarian problems, in which he stresses the supremacy of the unity of the divine essence over the multiplicity of the divine relations. Giles' emphasis on the unity of God, however, does not imply that divine relations are weakened. On the contrary, his doctrine of divine relations is much more complex and articulated than that of Aquinas. Giles' doctrine is based on a distinction between three kinds of relations (opposite, disparate and similar), which turns out to be a very powerful conceptual tool for dealing with some traditional problems of trinitarian theology, such as those concerning the priority-posteriority relationship among divine relations, their real distinction and their multiplication.

Among divine attributes, infinity ranks second only to unity. The importance of the infinity of God appears especially in Giles' discussion of the problem of the object of theology. Contrary to Aquinas, he constantly remarks that the object of theology cannot be God as God, since our finite intellect cannot grasp the infinity of God. Instead, the object of theology is to be identified with God regarded as the 'principle of our restoration and

the completion of our glorification' (*principium nostrae restaurationis et consummatio nostrae glorificationis*), according to the formula which characterized Giles' position in a long lasting debate in which Henry of Ghent and Godfrey of Fontaines were also involved. Giles' emphasis on the wide gap between finite creatures and infinite God does not lead him to a sceptical conclusion about the possibility of rational knowledge of the divine nature. He shows, for instance, an optimistic attitude towards our knowledge of the Trinity, since he maintains that natural reason can prove that the arguments against the Trinity of the divine persons are not conclusive (see God, concepts of; Trinity).

Finally, Giles was also a preacher. His preaching activity, as attested to by a collection of seventy-six sermons written by Giles himself, is one of the most original in the thirteenth century, since it is characterized by strong doctrinal commitments and is closely related to his theological works. Indeed most of Giles' sermons can be considered as short theological treatises and represent an important source for a final assessment of his theological thought.

6 Politics

Giles' political thought centres on the theory of the supremacy of spiritual power over temporal power. In the *De regimine principum* he holds that the state originates from the natural tendency of human beings to live in a civil society, but in the *De ecclesiastica potestate* he also stresses that the state must be subordinated to spiritual power. In Giles' view, the distinction between temporal and spiritual power is based on the distinction in the human being between body and soul, but the subordination of temporal to spiritual power is based on the order in the universe, according to which only spiritual power derives directly from God, whereas temporal power is dependent upon the spiritual.

List of works

Giles' works can be chronologically divided into four chronological periods: before 1277/8, 1278-85, 1286-95 and 1296-1316. The main works belonging to each of these groups are listed below, after the complete works.

Giles of Rome [Aegidius Romanus] (before 1271-after 1309) *Aegidii Romani Opera Omnia (Complete Works of Giles of Rome)*. In addition to the volume containing the edition of Giles' *Apologia* and the one containing the *Repertorio dei sermoni*, noted above, the following volumes of *census* and description of the manuscripts have been published: *Aegidii Romani Opera Omnia*, Catalogo dei manoscritti: I, 1, 1 (Vatican), a cura di B. Faes de Mottoni and C. Luna, Florence: Olschki, 1987; I, 1, 2* (Florence, Padua, Venice), a cura di F. Del Punta and C. Luna, Florence: Olschki, 1989; I, 1, 3* (Dipartimenti), a cura di F. Del Punta and C. Luna, Florence: Olschki, 1987; I, 1, 3** (Paris), a cura di C. Luna, Florence: Olschki, 1988; I, 1, 5* (Munich), a cura di B. Faes de Mottoni, Florence: Olschki, 1990; I, 1, 11 (*De Regimine Principum*) (Vatican), a cura di F. Del Punta and C. Luna, Florence: Olschki, 1993.

1 Before 1277/8

Giles of Rome [Aegidius Romanus] (before 1271) *Super librum I Sententiarum, reportatio (On the First Book of the Sentences)*, ed. C. Luna (1990), 'Fragments d'une reportation du commentaire de Gilles de Rome sur le premier livre des *Sentences*. Les extraits des mss. Clm. 8005 et Paris, B. N., Lat. 15819', *Revue des sciences philosophiques et théologiques* 74: 234-54, 446-56.(Giles' commentary on the first book of the *Sentences* of Peter Lombard.)

Giles of Rome [Aegidius Romanus] (before 1271) *Super librum II Sententiarum, reportatio (On the Second Book of the Sentences)*.(An edition of this recently discovered work is in preparation.)

Giles of Rome [Aegidius Romanus] (before 1271) *Super librum III Sententiarum, reportatio (On the Third Book of the Sentences)*, ed. C. Luna (1990), 'La *Reportatio* della lettura di Egidio Romano sul libro III delle *Sentenze* e il problema dell'autenticità dell'*Ordinatio*', *Documenti e studi sulla tradizione filosofica medievale* 1 (1): 179-225.(Giles' commentary on the third book of the *Sentences* of Peter Lombard.)

Giles of Rome [Aegidius Romanus] (before 1271) *Super librum IV Sententiarum, reportatio (On the Fourth Book of the Sentences)*, ed. C. Luna (1990), 'La lecture de Gilles de Rome sur le quatrième livre des *Sentences*. Les

extraits du Clm. 8005', *Recherches de théologie ancienne et médiévale* 57: 216-54.(Giles' commentary on the fourth book of the *Sentences* of Peter Lombard.)

Giles of Rome [Aegidius Romanus] (*c*.1269-72/3) *Quaestiones metaphysicales, reportatio (Metaphysical Questions)*, Venice, 1501.(Edition of questions on metaphysics.)

Giles of Rome [Aegidius Romanus] (*c*.1271-3) *Super librum I Sententiarum, ordinatio (On the First Book of Sentences)*, Venice, 1521.(Further commenary on the *Sentences* of Peter Lombard.)

Giles of Rome [Aegidius Romanus] (*c*.1271-4) *Super libros Rhetoricorum (On Aristotle's Rhetoric)*, Venice, 1515.(Commentary on Aristotle.)

Giles of Rome [Aegidius Romanus] (*c*.1274) *Super De generatione et corruptione (On Aristotle's On Generation and Corruption)*, Venice, 1505.(Commentary on Aristotle.)

Giles of Rome [Aegidius Romanus] (*c*.1274) *Quaestiones super librum I De generatione et corruptione (Questions on the first book of Aristotle's On Generation and Corruption)*, Venice, 1505.(Questions on Aristotle.)

Giles of Rome [Aegidius Romanus] (*c*.1274) *Theoremata de Corpore Christi (Theorems about Christ's Body)*, Rome, 1554.(Metaphysical work.)

Giles of Rome [Aegidius Romanus] (*c*.1274-5) *Super libros Elenchorum (On Aristotle's Sophistical Refutations)*, Venice, 1496.(Commentary on Aristotle.)

Giles of Rome [Aegidius Romanus] (*c*.1274-5) *Super Physicam (On Aristotle's Physics)*, Venice, 1502. (Commentary on Aristotle.)

Giles of Rome [Aegidius Romanus] (after 1274) *De plurificatione intellectus possibilis (On the Multiplication of the Possible Intellect)*, Venice, 1500; ed. H. Bullotta, Rome: Barracco, 1957.(Giles on the intellect.)

Giles of Rome [Aegidius Romanus] (before 1275) *Errores philosophorum (Errors of the Philosophers)*, ed. J. Koch, Milwaukee, WI, 1944.(Criticizes Aristotle on the unity of the substantial form.)

Giles of Rome [Aegidius Romanus] (*c*.1276) *Super De anima (On Aristotle's On the Soul)*, Venice, 1500. (Commentary on Aristotle.)

Giles of Rome [Aegidius Romanus] (1277-8) *Contra gradus et pluralitatem formarum (Against the Degrees and Plurality of the forms)*, Venice, 1500.(Argues that the doctrine of the unity of substantial form is in agreement with faith.)

2 1278-85

Giles of Rome [Aegidius Romanus] (*c*.1280) *De regimine principum (On the Governance of Princes)*, Rome, 1607.(Gives the view that the state originates from the natural tendency of human beings to live in a civil society.)

Giles of Rome [Aegidius Romanus] (1281) *Quaestiones disputatae in capitulo generali Paduae (Questions Disputed at the General chapter of Padua)*, ed. G. Bruni (1939), *Analecta Augustiniana* 17: 125-50.(Edition of disputed questions.)

Giles of Rome [Aegidius Romanus] *Theoremata de esse et essentia (Theorems on Being and Essence)*, ed. E. Hocedez, Louvain: Musuem Lessianum, 1930.(Metaphysical theorems.)

3 1286-95

Giles of Rome [Aegidius Romanus] (*c*.1286-7) *Quaestiones de esse et essentia (Questions on Being and Essence)*, Venice, 1503.(Metaphysical questions.)

Giles of Rome [Aegidius Romanus] (before 1288) *De materia caeli contra Averroistas (On the Matter of the Heavens, Against Averroists)*, Venice, 1500.(Treatise against the Averroists.)

Giles of Rome [Aegidius Romanus] (*c*.1287-8) *Quaestiones de cognitione angelorum (Questions on the Angels' Knowledge)*, Venice, 1503.(Early edition; no modern edition exists at present.)

Giles of Rome [Aegidius Romanus] (*c*.1288-9) *Quaestiones de mensura angelorum (Questions on the Measure of the Angels)*, Venice, 1503.(Early edition; no modern edition exists at present.)

Giles of Rome [Aegidius Romanus] (*c*.1287-90) *Quaestiones de compositione angelorum (Questions on the Composition of the Angels)*.(No published edition exists. The work can be found in manuscript at Toulouse, Bibl. Mun., ms. 739, fols. 96ra-103vb.)

Giles of Rome [Aegidius Romanus] (1286-91) *Quodlibeta*, Louvain, 1646.(Edition of Giles' quodlibetal questions.)

Giles of Rome [Aegidius Romanus] (*c*.1289-91) *Super De causis (On the Book of the Causes)*, Venice, 1550. (Commentary on Aristotle.)

Giles of Rome [Aegidius Romanus] (after 1288) *Tractatus de subiecto theologiae (Treatise on the Object of Theology)*, Venice, 1504; ed. C. Luna (1991) 'Una nuova questione di Egidio Romano *De subiecto theologiae*', *Freiburger Zeitschrift für Philosophie und Theologie* 38: 129-58.(Theological treatise.)

Giles of Rome [Aegidius Romanus] (after 1288-9) *Quaestiones de motu angelorum (Questions on the Movement of the Angels)*, ed. G. Bruni (1939) *Analecta Augustiniana* 17: 22-66.(Metaphysical work.)

Giles of Rome [Aegidius Romanus] (after 1288-9) *Super Posteriora Analytica (On Aristotle's Posterior Analytics)*, Venice, 1488.(Commentary on Aristotle.)

Giles of Rome [Aegidius Romanus] (after 1288-9) *De formatione corporis humani in utero (On the Formation of the Human Body in the Uterus)*, Arimini, 1626.(Scientific work.)

Giles of Rome [Aegidius Romanus] (after 1288-9) *Quaestio de subiecto theologiae (Question on the Subject of Theology)*, ed. C. Luna (1990) 'Una nuova questione di Egidio Romano *De subiecto theologiae*', *Freiburger Zeitschrift für Philosophie und Theologie* 37: 429-39.(Edition of a theological question.)

4 1296-1316

Giles of Rome [Aegidius Romanus] (after May-June 1297) *De renuntiatione papae (On the Abdication of the Pope)*, Rome, 1554.(Sides with Pope Boniface VIII in the dispute over the latter's election.)

Giles of Rome [Aegidius Romanus] (finished before 1303) *Hexaemeron*, Rome, 1555.(No modern edition of this work exists at present.)

Giles of Rome [Aegidius Romanus] (1301-2) *De ecclesiastica potestate (On the Ecclesiastical Power)*, ed. R. Scholz, Weimar: Hermann Böhlaus Nachfolger, 1929.(On the conflict between Pope Boniface VIII and King Philip IV of France.)

Giles of Rome [Aegidius Romanus] (finished not before 1309) *Super librum II Sententiarum, ordinatio (On the Second Book of the Sentences)*, Venice, 1581.(Further work on the second book of Peter Lombard's *Sentences*.)

Giles of Rome [Aegidius Romanus] *Super librum III Sententiarum, ordinatio (On the Third Book of the Sentences)*, Rome, 1623.(Spurious. See C. Luna (1990-1) 'La *Reportatio* della lettura di Egidio Romano sul libro III delle *Sentenze* e il problema dell'autenticità dell'*Ordinatio*', *Documenti e studi sulla tradizione filosofica medievale* 1 (1): 113-78; 2 (1): 75-146.)

5 Undated and complete works

Giles of Rome [Aegidius Romanus] (n.d.) *Sermones (Sermons)*, partially published in C. Luna, *Aegidii Romani Opera Omnia*, I, 6, *Repertorio dei sermoni*, Florence: Olschki, 1990.(Edition of Giles' collected sermons.)

Gioberti, Vincenzo (1801-52)

The work of Vincenzo Gioberti was a life-long attempt to reconnect philosophy and Christianity, and tradition and progress, within the political turmoil of early nineteenth-century Italy and the rise of new philosophies of history. His critique of subjectivism led him to propose a Neoplatonic scheme (epitomized in what he called the 'ideal formula'), which finds its root in an original intuition of being. From this intuition he deduced that the Being as the creator is God. But reflective judgment is not mere contemplation: as thinking and creating are the same in God (God is 'the first philosopher'), so thinking and acting are the same in man, as an image of God. History and civilization are the continuation of the creative process in which the return of existence to being leads duality to unity again, although it keeps the ontological gap of creatural relationship.

Gioberti was an outstanding intellectual of the Italian Risorgimento and the leader of the Neo-guelphic movement, whose aim was national unification under the Pope's leadership and national identity based on Catholicism. However, despite his involvement in active politics (he was both exiled and later became Prime Minister of Piedmont), his philosophical vocation was constantly pre-eminent.

Gioberti's philosophy took systematic shape in *Introduzione allo studio della filosofia (Introduction to the Study of Philosophy)* (1840). For him the main object of philosophy is the Idea, which cannot be considered as a mere mental representation or as a psychological construction. Gioberti's argument starts from a critique of Descartes' philosophy of the subject, which he calls 'psychologism'. This is 'the modern heterodoxy of philosophical sciences' which alters the legitimate notion of Idea, whose meaning expresses 'neither our concept, nor any other created thing or property, but the absolute and eternal truth, as it reveals itself to man's intuition' (1840 (2): 1). According to Gioberti, Descartes did in philosophy what Luther had done in theology. In both cases truth is derived from the state of the subject, from its intimate sense. The priority of the Idea is denied and what takes its place is a conceptual simulacrum, in which sensibilia and intelligibilia are mixed into a contradictory synthesis. Gioberti describes five possible developments of Descartes' position which correspond to five moments of modern philosophy: (1) Cartesianism itself; (2) Lockean empiricism; (3) Spinozism and German idealism; (4) Kantianism and French sensism; and (5) Humean scepticism. The order of classification finds its own consistency in the progressive shift of Descartes' subjective foundation towards the giving up of every ontological perspective until the Humean elision of the foundation itself. In this sequence, the third moment takes a central and recursive place. Between the permanence of an ontology which contradicts its own foundation, as in Cartesianism, and the negation of any ontology, as in Hume, this moment presents an attempt to construct a new ontology fully consistent with the new method and therefore totally different from traditional ontology.

Gioberti's argument is that the new method perverts the ontological outlook implied in all men by original intuition, and leads it to pantheism, that is, an ontology which confuses being and existence, through a reflection misled by subjectivism. As Spinozism was a necessary result of Cartesianism, so the necessary outcome of Kantian criticism was German idealism. Gioberti's notion of pantheism is very wide-ranging and covers several philosophical positions, for it summarizes the consequences of a deceptive approach to the relationship between intuition and reflection. Its real meaning is clarified by the polemic Gioberti elaborated in *Degli errori filosofici di Antonio Rosmini (On the Philosophical Mistakes of Antonio Rosmini)* (1841-43). Although Gioberti was close to Rosmini in his judgment of post-Cartesian philosophy, he could not accept his claim that being, which is the object of our intuition, is, first of all, ideal being. Rosmini's being is a psychological *primum* - a mental object and, therefore, a form of the human mind - and not an ontological *primum*: the latter should be founded on the former and their coincidence should be the aim of the reflection (see Rosmini-Serbati, A.). Against Rosmini, Gioberti asserts that the Idea itself is present as a true reality to intuition, whose passivity we have to acknowledge. Truth does not belong to a performance of mind, but to the Idea which becomes evident by penetrating the mind and making it partake of itself. In this way it is possible to escape psychologistic anthropocentrism: philosophy performs a reflective judgment which is really 'voluntary, subjective, human', although it finds legitimacy and objectivity because it is a repetition of intuitive judgment, which precedes, establishes and authorizes it.

This is the birth of the 'ideal formula' by which Gioberti expresses his own philosophical position called 'ontologism'. The formula consists of three statements connected to each other: (1) being is by necessity, (2) being

creates the existent and (3) the existent comes back to being. These statements identify two cycles. The first clarifies the relation between Creator and creatures; for existing-beings are literally so (as *ex-sistentes*) and their reason is outside themselves, in being as a creator. In the second cycle, man, as an image of being, finds his own creative dimension in thinking. The return to being takes the features of the human *methexis* of being's activity: it is man who makes himself the creator of history, institutions and culture, and it is man's creative progress which makes intelligible the sensible of nature by realizing its potential to be word.

The ideal formula formed a theoretical structure for a philosophical encyclopedia, whose first developments were the writings *Del bello (On Beauty)* (1841) and *Del buono (On Good)* (1843a), and to which are correlated *Primato morale e civile degli Italiani (Moral and Civil Primacy of Italians)* (1843b) and *Del rinnovamento civile in Italia (Of Italy's Civil Renewal)* (1851). These mark the birth of the Neo-guelphic project and its fall as a result of the First War of National Liberation (1848-9). In *Primato* Gioberti attributed to Italian national events a crucial role in the fate of Europe and at the same time wished to force the Catholic Church to become the guarantor of progress and of liberties. This explains his polemic against the Jesuits in *Il Gesuita moderno (The Modern Jesuit)* (1846-7). In *Del rinnovamento* a secular Papacy is no longer given a central role, and the defence of the internal *status quo* of states gives way to the acceptance of the ineluctable republican destiny of post-1848 Europe. Sovereignty is of the Idea, the choice between monarchy or republic only a matter of political opportunity: the Piedmontese way to Italian unity is supported, but only on this basis. What remains is the emphasis on the religious determination of progress: its catholicity.

Gioberti's legacy in Italian philosophy is linked to the participative moment of the second cycle of the ideal formula and especially to its version as it appears in the posthumously published *Protologia (First Science)* (1857). This work uses a great deal of Hegelian vocabulary and puts more stress on the dialectical determination of the formula. Man's thought in his return to being takes on the character of a con-creation, and Gioberti goes so far as to speak of a real 'palingenesis'. Some scholars see here a new phase in Gioberti's philosophy, where the opposition between transcendence and immanence loses its traditional sharpness. Supporting this interpretation, Bertrando Spaventa in his book *La filosofia di Gioberti (Gioberti's Philosophy)* (1863) recognized in Gioberti's work the inquiry of a principle of all things not in the absolute objectivity, material or ideal, but in the absolute mind. For him it represented a moment of the homecoming of Italian thought which had its origins inBruno andVico, and thence emigrated into German philosophy. In the late nineteenth century these aspects of Gioberti's work contributed to the theoretical roots of the actualism of Giovanni Gentile (§2).

Glanvill, Joseph (1636-80)

Joseph Glanvill was an opponent of the scholastic philosophy which he had been taught in England, supporting instead the new learning associated with Francis Bacon and the Royal Society of which he became a Fellow in 1664. Although he called himself a sceptic and is often so classified, this may easily give a misleading picture of his philosophy. He was a sceptic in so far as he believed that human knowledge is very limited, opposing both the extravagant religious 'enthusiasm' for doctrines to the contrary which still retained adherents throughout his life, and the more general dogmatism which holds firmly to an opinion even though the evidence does not warrant it. Although he was not untouched by the revival of Platonic philosophies in Cambridge and was a great admirer of Henry More, in general he advocated an anti-dogmatic and generally empirical philosophy which in some ways anticipates the thought of Locke. In one area he might be accused of succumbing to the enthusiasm of his opponents, and that was in his espousal of a belief in witchcraft, though he claimed that in his explorations of the spirit world he was merely concerned to gather empirical evidence for a religious view. His analysis of causation has been held to anticipate that of Hume. Although it is true that he does have some of Hume's insights, the extent of that anticipation has sometimes been exaggerated.

1 The way to science

The tone of the English philosopher Glanvill's thought is almost always aimed at reconciling the new philosophy, associated with Francis Bacon, Descartes and the early members of the Royal Society, with traditional Christian doctrine as espoused by the Anglican Church. In doing so he laid great stress on the merits of the new philosophy and the limitations of human knowledge, itself substantially, but not wholly, the product of experience.

Glanvill's first and most important work, *The Vanity of Dogmatizing* (1661), was somewhat modified and improved as *Scepsis Scientifica* (1665). In them he sees 'confest ignorance as the way to science'. He argues that a proper recognition of our limited understanding of the world will provide an antidote to the dogmatic but unwarranted claims to knowledge all too often made, especially by the Aristotelians whom he regarded as the major opponents. Conceits and fancies too often stand in the way to true knowledge and we must recognize that, since the fall of man, ignorance has been the dominant human condition. The book develops examples of that ignorance: as the 'divine Plato' said, we have both mind and body. But how they are connected is a mystery. We can give no account of the nature of spirit. Even the 'ingenious Descartes' cannot help us. We are entirely dependent on our senses for our knowledge but, as we can see only the surface of things, our knowledge is scant and limited.

Despite these limitations, Glanvill regards Descartes' philosophy as providing the best alternative to Aristotelianism, although his understanding of Descartes' philosophy as providing merely hypothetical explanations of phenomena is undoubtedly one that Descartes would not have recognized. And although his empiricism was tempered with a commitment to some innate knowledge of the Platonic kind, he was not a rationalist in any serious sense. He follows Descartes in accepting a distinction between primary and secondary qualities and a generally mechanical philosophy.

Several chapters are a direct attack on Aristotelian philosophy, regarded as entirely devoid of merit. It is merely verbal, litigious, gives no account of the phenomena, makes no discoveries and is inconsistent with both divinity and itself.

2 Causation and contingency

Among the many other examples of our sources of error and ignorance given by Glanvill, the one that has drawn most attention to his writings over the years has been his account of causation, which in important ways anticipates the much more famous analysis of David Hume in the following century. The crucial section in Glanvill is very short:

> All knowledge of causes is *deductive*: for we know none by simple intuition; but through the mediation of their effects. So that we cannot conclude, anything to be the cause of another; but from its continual accompanying it: for the *causality* it self is *insensible*. But now to argue from a concomitancy to a causality, is not infallibly conclusive: yea in this way lies notorious delusion.

(Glanvill 1665: 142)

Glanvill, like Hume, recognizes the contingency of causal inference, its empirical basis in constant conjunction, and its fallibility. To claim knowledge of causes from our simple observations of constancies is merely a conceit, we never have more than conjectures.

In recognizing that we cannot observe the causal relationship but only the constant conjunction, Glanvill clearly went a long way towards Hume's position. Nor is this so surprising, given that both of them begin from the empiricist position that the source of knowledge is experience. And, whatever Hume's position might be, it is also clear that Glanvill does not deny the reality of causal relations in the world, only the certainty of our knowledge of them. His argument is entirely epistemic: we have no knowledge of necessary connection, but that does not entail that necessary connections do not exist. He does not explore the further question as to whether we have any reason at all to believe that there are any such connections. But this was in a sense already excluded by his realist commitment to the physical world, which remains an unexamined assumption in his philosophy. This emerges clearly in his account of our ignorance of the natural causes of phenomena in a later chapter. We cannot, he says, infer to the hidden causes of phenomena except by analogy, but this is notoriously unreliable because there is so often little resemblance between an effect and its cause. To claim that the causes must be as we conceive them is to set unwarranted bounds to omnipotency. We have to settle for the limited knowledge we have through our senses and refrain from the all-too-human tendency to make dogmatic claims which extend beyond our ability to know.

3 Glanvill and More

Glanvill can sound extremely modern and he does anticipate the later British empiricists, particularly Locke and Hume, in important ways. But we should also appreciate that he combined his empiricism with an early admiration for the philosophy of Henry More and Plato which fits less easily with that empirical tradition. In his early *Lux Orientalis* (1662) he followed More, Origen, Plato and the Cambridge Platonist George Rust in a commitment to pre-existence (see Cambridge Platonism). Yet, consistent with his position in *The Vanity of Dogmatizing*, he recognized that he had shown only that it is probably true and not that it must be.

Glanvill, once again following More, argues that, although spirit is primary, it is totally insensate without body and never acts 'but in some body or other', even though that body does not have to be the one we have now. He also sees the arguments for pre-existence as providing evidence for the independent existence of the soul and thus for the possibility of immortality. In subscribing to the Platonist theory he also commits himself to a theory of plastic nature which seems somewhat at odds with his cautious scepticism in other areas.

4 Witches and spirits as natural phenomena

Glanvill maintained a strong commitment to the existence of witches, which appeared in several of his publications. He claimed there was strong empirical evidence for their existence, and that they did exist itself argued for the spiritual world and our immortality. To deny their existence, as did Hobbes, was a short step away from atheism. Witchcraft and the world of spirits Glanvill regarded as further natural phenomena that deserved investigation entirely within the spirit of the Royal Society.

It is this last point that is perhaps the central feature of Glanvill's thought and which gives him a modest but real place in the history of philosophy. For in the early decades of the Royal Society he provided a philosophical defence of its methods and procedures against its assailants, in particular Henry Stubbe and Meric Casaubon. Central to much of Glanvill's argument was the belief that the study of nature in the way advocated by the Royal Society provided strong support for religion, rather than the opposite, particularly in exhibiting, as he expressed it in *Philosophia Pia* (1671: 17), 'the wonderful art, and contrivance that is in the contexture of the effects of nature'. In mounting this defence of a rational, cautious empiricism as a road to a deeper religious knowledge, Glanvill contributed substantially to the intellectual respectability of the new natural sciences without ever reaching a philosophical depth comparable to that achieved later in the century by John Locke.

Gnosticism

Gnosticism comprises a loosely associated group of teachers, teachings and sects which professed to offer 'gnosis', saving knowledge or enlightenment, conveyed in various myths which sought to explain the origin of the world and of the human soul and the destiny of the latter. Everything originated from a transcendent spiritual power; but corruption set in and inferior powers emerged, resulting in the creation of the material world in which the human spirit is now imprisoned. Salvation is sought by cultivating the inner life while neglecting the body and social duties unconnected with the cult. The Gnostic movement emerged in the first and second centuries AD *and was seen as a rival to orthodox Christianity, though in fact some Gnostic sects were more closely linked with Judaism or with Iranian religion. By the fourth century its influence was waning, but it persisted with sporadic revivals into the Middle Ages.*

1 Basic doctrines

Gnosticism can best be understood in terms of family likeness. One can identify characteristic features, most of which are found in most Gnostic sects; but the attempts often made to define Gnosticism in terms of universally present common features can only approximate to the truth.

Characteristic tenets include:

1 A radical dualism, contrasting a transcendent realm of pure spirit with the world of gross matter. The human makeup likewise presents a sharp contrast of spirit and sensuality, with a corresponding distinction between the 'elect' or spiritual people and the rest of society, though some systems introduce an intermediate grade.
2 A creator presented as imperfect or evil, though commonly identified with the God of Judaism, and sharply contrasted with the supreme divinity, who is his ultimate source. His existence is explained by various myths depicting events prior to the creation and claiming to show how evil dispositions arose by accumulated lapses among the heavenly powers.
3 The human spirit originated in the higher realm, but is now imprisoned in the form of a soul within the material body. Many Gnostic sects taught that the same spirit can live many lives. But it is often seen as predestined to salvation or the reverse.
4 The Gnostics' aim was to liberate their spirits from all attachment to material things, and thereby return with the elect minority to ultimate happiness. Most Gnostic sects therefore adopted a puritan ethic, though some held that all physical actions are contemptible and approved licentious conduct as a sign of liberation.

2 Definitions, origins and dating

'Gnosticism' is a term coined by modern scholars. Ancient writers allude to 'gnosis', that is, knowledge, especially spiritual knowledge or enlightenment. St Paul speaks disparagingly of Christians who laid claim to it (1 Corinthians 8: 1), but it was nevertheless commended by Clement of Alexandria and others. Clement also uses 'Gnostic' to mean a devout and instructed Christian. The Gnostic sects themselves had no common self-designation parallel to 'Jew' or 'Christian', and were commonly named after their founders. Irenaeus (*c*.130-*c*.200), however, implies that the term was appropriated by several sects, and its use was soon extended to include all similar schools.

There has been much debate about the origins of Gnosticism, whether Greek, Jewish or Iranian. It now appears that the movement was too diversified for any single-source theory to be acceptable, and many forms of it clearly presuppose an amalgamation of different cultures. Its ablest exponents, including Valentinus and Marcion (*fl.* *c*.140-60), inherit the traditions of Hellenistic Judaism, incorporating Christian elements; the rest are unlikely to interest students of philosophy.

The problem of dating has been complicated by ill-defined terminology. It has been claimed that Gnosticism originated in Iran before the Christian movement emerged. But it now appears that the emergence of *systematic* Gnostic teaching is roughly contemporaneous with a parallel Christian development, though many of the ideas found in Gnosticism were current earlier. Scholars, especially in Germany, now tend to reserve the term 'Gnosticism' for the elaborate systems described by Irenaeus around 180 AD, for example, using 'Gnosis' as an

inclusive term for its constituent ideas.

Mandaeism, a small Gnostic sect unnoticed by Christian writers, has attracted some attention from scholars, as the sect still survives and has preserved sacred writings of great antiquity. Its claim to derive from John the Baptist is probably unfounded.

3 Sources

For many centuries Gnosticism was known only through the writings of its Christian opponents, notably Irenaeus, Tertullian and Clement, who did however embody quotations from the works they criticized. Some later Gnostic texts of dubious value emerged in the eighteenth century, supplemented by the important Berlin Codex 8502 (discovered 1901, fully edited 1955). But the situation was transformed by the discovery of forty-four books in codex form at Nag-Hammadi in Upper Egypt in 1944 (though once again publication was delayed). Most are Coptic translations of Greek originals, some of which probably date from the first century AD. Many of them introduce biblical characters, though strongly influenced by Gnostic assumptions. Three may be mentioned in particular: the Apocryphon of John, which abounds in fanciful mythology, but was apparently authoritative and survives in several copies; the Gospel of Thomas, a collection of sayings ascribed to Jesus, isolated from their settings and accompanying actions, but sometimes presenting variant forms of canonical Gospel texts; and the so-called Gospel of Truth (*Evangelium veritatis*), the one item in the collection which could without absurdity be annexed to the Christian scriptures; it has no marked heretical features and offers an original meditation on the passion of Christ.

The list of sources should be extended by a brief note on Manicheism, a Gnostic sect founded by Mani (Manes, Manichaeus) around 216-76 AD in Iran, and influential especially in the fourth century, when it briefly captured St Augustine (see Manicheism). Earlier patristic and Muslim sources can now be compared with Manichean documents found at Turfan from 1898 and in Egypt from 1930 onwards, including a biography of the founder.

4 Philosophical content and value

Early Christian writers, especially Hippolytus (*c*.170-*c*.236), argued that the Gnostics were influenced by Greek philosophy. In most cases this is unlikely, and where such influence existed it has been overlaid by mythology. Some philosophical schools, for example, Sceptics and Epicureans, can be discounted; Stoic influence was slight and indirect. One must also exclude the dominant Platonism, which taught the eternity of the world, taking the *Timaeus* to symbolize its eternal dependence on creative goodness. But some Gnostic sects echo the Jewish and Christian Platonism that assimilated the early chapters of Genesis with the *Timaeus* interpreted historically, as it was by Plutarch and Atticus. The Nag-Hammadi texts include an extract from Plato’s *Republic* (588a-589b) inaccurately reproduced in Coptic. Pythagorean influence appears in the significance assigned to numbers, already present in the Jewish practice of Gematria, where numbers, commonly expressed by letters, are regrouped to yield significant words; thus 666, ‘the number of the beast’ (Revelation 13: 18), can be split up, it is alleged, to yield the letters NERO CAESAR.

Platonic traits appear clearly in the Valentinian system, which was widely influential and is commonly taken as typical. Valentinus was a gifted man who hoped to be made Bishop of Rome, and so presumably restrained his speculative powers, as his scanty surviving fragments suggest. Yet the Valentinian system, as known only one generation later, presents a bewilderingly complex mythology, clearly unacceptable to mainstream Christians.

Note however the following features:

1 Dualism is modified to include an intermediate grade: three levels of being - spirit, soul and matter; and three classes of people - the Gnostic elect, the conventional church member, the unregenerate outsider - which recalls the three classes of citizens in Plato’s *Republic*.
2 Evil is traced to defective cognition.
3 The ultimate divinity expands to form a series of powers or ‘Aeons’. The first derivative is God’s self-knowledge (his ‘Ennoia’). But the process goes wrong: in the developed Valentinian myth, the primal fault is ascribed to the last in a series of thirty Aeons, who nevertheless bears the prestigious name of Sophia. This may point to an earlier conception in which it is the *first* derivative, Ennoia-Sophia, who fails. Conversely, Irenaeus describes a further development in which the erring Sophia herself is duplicated.

The myth serves to express a fundamental problem of theology. The ancients commonly thought of knowledge as a process of copying; thus we may be said to know someone when we can recall that person's features. Thus any knowledge of God must be a kind of replica. But it cannot be perfect, or it would amount to a second divinity. So any attempt to elucidate God must be presumptuous. The most thoughtful treatment of the problem appears in the Tripartite Tractate from Nag-Hammadi. Here God's nature is expressed in a series of powers which at first appear as impersonal attributes; but to replicate God's being each one must become a sovereign will; they thus incur a common failure, as each one fails to consider its own incompleteness and its need of the others. This account of the primary fault is clearly more persuasive than the official Valentinian theory, which fixes the blame exclusively on Sophia. But the majority of Gnostic teachers were catering for untrained minds, and sought to impress them with increasingly complex and pretentious mythology, a feature which today baffles and repels many philosophers.

God, arguments for the existence of

Arguments for the existence of God go back at least to Aristotle, who argued that there must be a first mover, itself unmoved. All the great medieval philosophers (Arabic and Jewish as well as Christian) proposed and developed theistic arguments - for example, Augustine, al-Ghazali, Anselm, Moses Maimonides, Thomas Aquinas and Duns Scotus. Most of the great modern philosophers - in particular René Descartes, Gottfried Leibniz and Immanuel Kant - have also offered theistic arguments. They remain a subject of considerable contemporary concern; the twentieth century has seen important work on all the main varieties of these arguments.

These arguments come in several varieties. Since Kant, the traditional Big Three have been the cosmological, ontological and teleological arguments. The cosmological argument goes back to Aristotle, but gets its classic statement (at least for European philosophy) in the famous 'five ways' of Aquinas, in particular his arguments for a first uncaused cause, a first unmoved mover, and a necessary being. According to the first-mover argument (which is a special case of the first-cause argument), whatever is moved (that is, caused to move) is moved by something else. It is impossible, however, that there should be an infinite series of moved and moving beings; hence there must be a first unmoved mover. Aquinas goes on to argue that a first mover would have to be both a first cause and a necessary being; he then goes on in the next parts (Ia, qq.3-11) of the Summa theologiae to argue that such a being must have the attributes of God.

The perennially fascinating ontological argument, in Anselm's version, goes as follows: God is by definition the being than which none greater can be conceived. Now suppose God did not exist. It is greater to exist than not to exist; so if God did not exist, a being greater than God could be conceived. Since God is by definition the being than which none greater can be conceived, that is absurd. Therefore the supposition that God does not exist implies an absurdity and must be false. This argument has had many illustrious defenders and equally illustrious attackers from Anselm's time to ours; the twentieth century has seen the development of a new (modal) version of the argument.

Aquinas' fifth way is a version of the third kind of theistic argument, the teleological argument; but it was left to modern and contemporary philosophy to propose fuller and better-developed versions of it. Its basic idea is simple: the universe and many of its parts look as if they have been designed, and the only real candidate for the post of designer of the universe is God. Many take evolutionary theory to undercut this sort of argument by showing how all of this apparent design could have been the result of blind, mechanical forces. Supporters of the argument dispute this claim and retort that the enormously delicate 'fine tuning' of the cosmological constants required for the existence of life strongly suggests design.

In addition to the traditional Big Three, there are in fact many more theistic arguments. There are arguments from the nature of morality, from the nature of propositions, numbers and sets, from intentionality, from reference, simplicity, intuition and love, from colours and flavours, miracles, play and enjoyment, from beauty, and from the meaning of life; and there is even an argument from the existence of evil.

1 Cosmological arguments

Cosmological arguments start from some obvious and general but a posteriori fact about the universe: that there are contingent beings, for example, or that things move or change. We find first steps towards such an argument in Plato (*Laws* 10); Aristotle (§16) (*Metaphysics* 12; *Physics* 7, 8) gives it a fuller statement; the medieval Arabic (especially al-Ghazali) and Jewish philosophers (especially Maimonides) gave elaborate statements of the argument; but its *locus classicus* (for Westerners, anyway) is the first three of the famous 'five ways' of Aquinas' *Summa theologiae*. Following Aquinas, Duns Scotus (§§7-11) presented a subtle and powerful version of the argument, and in modern times the most influential versions of the argument are to be found in the works of Leibniz (§3) and Samuel Clarke (§1). (The most influential criticisms of the argument are given by Hume (§6) and Kant (§8).)

Following William Craig (1980), we may distinguish substantially three versions of the cosmological argument. First, the so-called *kalam* (Arabic, 'speculative theology') argument, developed by Arabic thinkers (for example, al-Kindi (§2) and al-Ghazali). Put most schematically, this argument goes as follows:

(1) Whatever begins to exist is caused to exist by something else.
(2) The universe began to exist.
(3) Therefore the universe was caused to exist; and the cause of its existence is God.

The second premise was supported by arguments for the conclusion that an 'actual infinite' is not possible: it is not possible, for example, that there have been infinitely many temporally non-overlapping beings each existing for at least a second; alternatively, it is not possible that an infinite number of seconds have elapsed. These arguments proceed by pointing out some of the paradoxes or peculiarities that an actual infinite involves (see Infinity). For example, suppose there were a hotel with infinitely many rooms ('Hilbert's Hotel'). The hotel is full; a new guest arrives; despite the fact that each room is already occupied, the proprietor accommodates the guest by putting them in room 1, moving the occupant of room 1 to room 2, of room 2 to room 3, and in general the occupant of *n* to $n + 1$. No problem! Indeed, when a large bus containing infinitely many new guests pulls up, they too can all be accommodated: for any odd-numbered room *n*, move its occupant into room 2*n* (moving the occupant of *that* room n^* into $2n^*$, and so on), thus freeing up the infinitely many odd-numbered rooms. In fact, if it is a busy weekend and an infinite fleet of buses pulls up, each with infinitely many new guests, they too can all be easily accommodated. And the question is: is it really possible, in the broadly logical sense, that such a hotel could actually exist? The friend of the *kalam* argument thinks not, and adds that no other actual infinite is possible either. If so, then the universe has not existed for an infinite stretch of time, but had a beginning. Contemporary cosmological theory in physics has seemed to some to provide scientific, empirical support for the claim that the universe had a beginning; according to 'Big Bang' cosmology, the universe came into being something like 15 billion years ago, give or take a few billion (see Cosmology §3).

Given that the universe has a beginning, the next step is to argue (by way of the first premise) that it must therefore have had a cause; it could not have popped into existence uncaused. And the final step is to argue that the cause of the universe would have to have certain important properties - properties of God.

The second kind of cosmological argument is the kind to be found in the first three of Aquinas' five ways. His second way, for example, goes like this:

(1) Many things in nature are caused.
(2) Nothing is a cause of itself.
(3) An infinite regress of essentially ordered efficient causes is impossible.
(4) Therefore, there is a first uncaused cause - 'to which', says Aquinas, 'everyone gives the name of God.'

There are two points of particular interest about this argument. First, Aquinas disagrees with a premise of the *kalam* argument, according to which it is impossible that there be an actual infinite. He argues that it cannot be proved that the universe had a beginning; he thinks it possible (though false) that the universe has existed for an infinite stretch of time. How then are we to understand premise (3)? Aquinas is here speaking of a certain kind of series, an 'essentially ordered' series, a series of causes in which any cause of an effect must be operating throughout the whole duration of the effect's operation. It is only such series, he says, that cannot proceed to infinity. (Aquinas gives the example of a stick moving a stone, a hand moving the stick, and so on.) So the upshot of the argument, if it is successful, is that there exists at least one thing which causes other things to exist, but is not itself caused to exist by anything else.

But could there not be many such things? And would each of them be God? This brings us to the second point of interest. Aquinas argues that there must be a first unmoved mover, a first uncaused cause, a necessary being, and the like; but his theistic argument is not finished there. In the next eight questions he argues that anything that was a first efficient cause would have to be immaterial, unchanging, eternal, simple and the possessor of all the perfections to be found in those things dependent upon it - in a word, God. It is therefore incorrect to follow the usual custom of criticizing Aquinas for hastily concluding that a first cause or unmoved mover or necessary being would have to be God.

The third sort of cosmological argument is associated especially with Leibniz and Samuel Clarke; according to this version of the argument, there must be a sufficient reason for the actuality of any contingent state of affairs. Therefore there must be a sufficient reason for the existence of any contingent being - but also, says Leibniz, for the whole series of contingent beings. This sufficient reason must be the activity of God.

2 Ontological arguments

Anselm’s ontological argument has excited enormous controversy (see Anselm of Canterbury §§3-4). Aquinas rejected it, Duns Scotus ‘coloured’ it a bit and then accepted it; Descartes (§6) and Malebranche endorsed it; like Duns Scotus, Leibniz thought it needed just a bit of work to be successful; Kant rejected it and delivered what many thought to be the final quietus (though others have found Kant’s criticisms both intrinsically obscure and of doubtful relevance to the argument); and Schopenhauer thought it a ‘charming joke’. Although in the twentieth century it was defended by (among others) Charles Hartshorne, Norman Malcolm and Alvin Plantinga, probably most contemporary philosophers reject the argument, thinking it a joke, but not particularly charming.

Anselm’s version goes as follows:

> Hence, even the fool is convinced that something exists in the understanding, at least, than which nothing greater can be conceived…. And assuredly that, than which nothing greater can be conceived, cannot exist in the understanding alone; for suppose it exists in the understanding alone; then it can be conceived to exist in reality; which is greater.
>
> Therefore, if that, than which nothing greater can be conceived, exists in the understanding alone, the very being, than which nothing greater can be conceived is one, than which a greater can be conceived. But obviously this is impossible. Hence, there is no doubt that there exists a being, than which nothing greater can be conceived, and it exists both in the understanding and in reality.
>
> (*Proslogion*, ch. 2)

This argument is a *reductio ad absurdum*: postulate the nonexistence of God, and show that this leads to an absurdity. Perhaps we can outline the argument as follows:

(1) A maximally great being (one than which nothing greater can be conceived) exists in the understanding (that is, is such that we can conceive of it).
(2) It is greater to exist in reality than to exist merely in the understanding.
(3) Therefore, if the maximally great being existed *only* in the understanding, it would be less than maximally great.

But it is impossible that the maximally great being be less than maximally great; hence this being exists in reality as well as in the understanding - that is, it exists. And clearly this maximally great being is God.

The earliest objection to this argument was proposed by Anselm’s contemporary and fellow monk Gaunilo in his *On Behalf of the Fool* (Psalm 14: ‘The fool has said in his heart "There is no God"’). According to Gaunilo, the argument must be defective, because we can use an argument of the very same form to demonstrate the existence of such absurdities as an island (or chocolate sundae, or hamster, for that matter) than which none greater can be conceived. (Says Gaunilo: ‘I know not which I ought to regard as the greater fool: myself, supposing that I should allow this proof; or him, if he should suppose that he had established with any certainty the existence of this island.’) But Anselm has a reply: the notion of a maximally great island, like that of a largest integer, does not make sense, cannot be exemplified. The reason is that the properties that make for greatness in an island - size, number of palm trees, quality of coconuts - do not have intrinsic maxima; for any island, no matter how large and no matter how many palm trees, it is possible that there be one even larger and with more palm trees. But the properties that make for greatness in a being - knowledge, power and goodness, for example - do have intrinsic maxima: omniscience, omnipotence and being perfectly good.

3 Ontological arguments (cont.)

The most celebrated criticism of the ontological argument comes from Immanuel Kant, who apparently argues in his *Critique of Pure Reason* (Transcendental Dialectic, bk II, ch. III, section 4) that if this argument were sound, the proposition ‘there is a being than which none greater can be conceived’ would have to be logically necessary; but there cannot be an existential proposition that is logically necessary. Sadly, his reason for making this declaration is itself maximally obscure. He adds that ‘existence is not a real predicate’, which is widely quoted as the principal objection to the argument. Unfortunately this dictum is of dubious relevance to Anselm’s argument and a dark saying in its own right. What might it mean to say that existence is not a real property or predicate?

And if it is not, how is that relevant to the argument? Why should Anselm care whether it is or not?

Perhaps we can understand Kant as follows. The argument as stated begins with the assertion that a maximally great being exists in the understanding; the idea is that this much is obvious, whether or not this being also exists in reality (that is, actually exists). Anselm then goes on to reason about this being, arguing that a being with the properties this one has - of being maximally great - cannot exist only in the understanding, but must exist in reality as well. So the argument depends upon the assumption that there *is* a maximally great being, and now the question is: does this being actually exist? Use the term ‘actualism’ for the view that there are not (and could not be) things that do not exist; the things that exist are all the things there are. Note that if this is true, then existence is a very special property: it is redundant, in that it is implied by every other property; anything that has *any* property (including the property of being maximally great) also has existence. But if actualism is true, the ontological argument as formulated above cannot work. For if it is not possible that there be things that do not exist, then in saying initially that there is a maximally great being, one that at any rate exists in the understanding, we are already saying that there exists a maximally great being, thus begging the question. If no maximally great being exists, then there simply is no such thing as a maximally great being, in which case we cannot (following Anselm) suppose initially that the maximally great being does not exist in reality and then argue that this being would be greater if it did exist in reality. If actualism is true, existence is a redundant property; but then to say that there is a maximally great being that exists in the understanding is already to say that there really exists a maximally great being. So perhaps Kant’s puzzling dictum should be seen as an early endorsement of actualism.

Of course Anselm might reply that the fault lies not with his argument, but with actualism; in any event, there are other versions that do not conflict with actualism. Charles Hartshorne (1941) claimed to detect two quite different versions of the argument in Anselm’s work; the second version is consistent with actualism and thus sidesteps Kant’s criticism. This version proceeds from the thought that a really great being would be one that would have been great even if things had been different; its greatness is stable across possible worlds, to put it in a misleading if picturesque way. So say that a being has *maximal excellence* in a given possible world *W* if and only if it is omnipotent, omniscient and wholly good in *W*; and say that a being has *maximal greatness* if it has maximal excellence in every possible world. Then the premise of the argument (thus restated) is simply:

Maximal greatness is possibly exemplified.

That is, it is possible that there be a being that has maximal greatness. But (given the widely accepted view that if a proposition is possibly necessary in the broadly logical sense, then it is necessary), it follows by ordinary modal logic that maximal greatness is not just possibly exemplified, but exemplified in fact. For maximal greatness is exemplified if and only if there is a being *B* such that the proposition

B is omnipotent and omniscient and wholly good (has maximal excellence)

is necessary. If maximal greatness is possibly exemplified, therefore, then some proposition of that sort is possibly necessary. By the above principle, whatever is possibly necessary is necessary; accordingly, that proposition is necessarily true and hence true.

So stated, the ontological argument breaches no laws of logic, commits no confusions and is entirely immune to Kant’s criticism. The only remaining question of interest is whether its premise, that maximal greatness is possibly exemplified, is indeed true. That certainly seems to be a rational claim; but it is not one that cannot rationally be denied. A remaining problem with the argument, perhaps, is that it might be thought that the epistemic distance between premise and conclusion is insufficiently great. Once you see how the argument works, you may think that asserting or believing the premise is tantamount to asserting or believing the conclusion; the canny atheist will say that he does not believe it is possible that there be a maximally great being. But would not a similar criticism hold of any valid argument? Take any valid argument: once you see how it works, you may think that asserting or believing the premise is tantamount to asserting or believing the conclusion. The ontological argument remains as intriguing as ever.

4 Teleological arguments

Teleological arguments start from contingent premises that involve more specific features of the universe, features which in one way or another suggest that the universe has been designed by a conscious and intelligent being.

These arguments have often been developed in close connection with modern science; they have been endorsed by many of the giants of modern science, including Isaac Newton. Here is a classic statement of the argument by William Paley (§2):

> In crossing a heath, suppose I pitched my foot against a *stone*, and were asked how the stone came to be there, I might possibly answer that for any thing I know to the contrary, it had lain there for ever: nor would it perhaps be very easy to show the absurdity of this answer. But suppose I had found a *watch* upon the ground and it should be inquired how the watch happened to be in that place, I should hardly think of the answer which I had before given, that, for any thing I know the watch might have always been there. Yet why should not this answer serve for the watch, as well as for the stone? For this reason and for no other: viz., that, when we come to inspect the watch, we perceive (what we could not discover in the stone) that its several parts are framed and put together for a purpose.
>
> ([1802] 1804: 1-2)

Paley then points out that the universe and some of its parts - for example, living things and their organs - resemble a watch, in that they give the appearance of having been designed in order to accomplish certain purposes. An eye, for example, looks like an extremely subtle and sophisticated mechanism designed to enable its owner to see. But the only serious candidate for the post of designer of the universe is God.

Kant, who had little but contempt for the cosmological and ontological arguments, was much less dismissive of this one. He still rejected the argument, however, pointing out that at most it shows that it is likely that there is a designer or architect of the universe; and it is a long way from a designer to the God of the theistic religions, an almighty, omniscient, wholly good creator of the world, by whose power the universe sprang into being. Of course, a cosmic architect - a being who has designed our entire universe, with its elements ranging across many orders of magnitude from gigantic galaxies to the minutest things we know - is no mean conclusion, and it seems churlish to dismiss it with an airy wave in order to point out that there is something even stronger that the teleological argument does not show.

5 Teleological arguments (cont.)

Many people, however, have rejected the teleological argument even taken as an argument for a designer. The eighteenth-century proponents of the argument invariably mentioned the apparent teleology in the biological world; but (so say the critics) Darwin changed all that. We now know that the apparent design in the world of living things is *merely* apparent. The enormous variety of flora and fauna, those enormously elaborate and articulate mechanisms, and finely detailed systems and organs such as the mammalian eye and the human brain give a powerful impression of design; but in fact they are the product of such blind mechanisms as random genetic mutation and natural selection. The idea is that there is a source of genetic variation which produces mutation in the structure and function of existing organisms. Most of these mutations are deleterious; a few are adaptive and their lucky owners will have an adaptive edge, eventually coming to predominate in a population. Given enough time, so the story goes, this process can produce all the splendid complexity and detail that characterize the contemporary living world (see Evolution, theory of).

Of course there is little real evidence that these processes can in fact achieve this much: naturally enough, we have not been able to follow their operation in such a way as to observe them produce, say, birds or mammals from reptiles, or even human beings from simian precursors. And even if we did observe the course of animate history (even if we had a detailed record on film), this would by no means show that blind mechanisms are in fact sufficient for this effect; for of course there would be nothing in the film record to show that those random genetic mutations were not in fact guided and orchestrated by God.

Still, the critic of the teleological argument claims not that in fact evolution has been accomplished just by these blind mechanisms, but that it could have been; if so, there is a real alternative to design. That these mechanisms really could have produced effects of this magnitude is far from clear; we have little real reason to suppose that there is a path through the space of possible animal design plans, a path leading from bacteria to human beings, and such that each new step is both adaptive and reachable from the previous step by mechanisms we understand. Still, the suggestion does perhaps damage the teleological argument by suggesting a naturalistic candidate for the post of producer of apparent design.

But organic evolution addresses only one of the areas of apparent design. There is also the origin of life; even the simplest unicellular creatures (prokaryotes such as bacteria and certain algae, for example) are enormously complex and upon close inspection look for all the world as if they have been designed; it is fair to say that no one, so far, has a decent idea as to how these creatures might have come into being just by way of the operation of the regularities of physics and chemistry. There are also the various considerations connected with the so-called 'fine tuning' of the universe. First, there is the 'flatness' problem. The mass density of the universe is at present very close to the density corresponding to the borderline between an open universe (one that goes on expanding for ever) and a closed universe (one that expands to a certain size and then collapses). The ratio between the forces making for expansion and those making for contraction is close to one. But then shortly after the Big Bang this value would have to have been inside a very narrow band indeed. Thus Stephen Hawking (1974): 'reduction of the rate of expansion by one part in 10^{12} at the time when the temperature of the Universe was 10^{10} K would have resulted in the Universe's starting to recollapse when its radius was only 1/3000 of the present value and the temperature was still 10,000 K' - much too warm for the development of life. On the other hand, if the rate of expansion had been even minutely greater, the universe would have expanded much too fast for the formation of stars and galaxies, required for the formation of the heavy elements necessary for the development of life.

Another kind of fine tuning was also necessary: of the fundamental physical constants. If any of the four fundamental forces (weak and strong nuclear forces, electromagnetic force, electron charge) had been even minutely different, the universe would not have supported life; they too must have been fine-tuned to an almost unbelievable accuracy. And the suggestion, again, is that given the infinite range of possible values for the fundamental constants, design is suggested by the fact that the actual values fall in that extremely narrow range of values that permits the development of intelligent life.

But there is a naturalistic riposte. Since the 1970s, several different sorts of 'inflationary' scenario have shown up. These postulate the formation (at very early times) of many different universes or subuniverses, with different rates of expansion, and different values for the fundamental constants. These inflationary models are motivated, in part, by a desire to avoid singularities and the accompanying appearance of design. If all possible values for the fundamental constants and the rate of expansion are actually exemplified in different subuniverses, then the fact that there is a subuniverse with the values ours displays no longer requires explanation or suggests a Designer. Many of these scenarios are wildly speculative and unencumbered by empirical evidence, but (if physically acceptable) they do tend to blunt the force of a design argument from fine tuning. (Of course, someone who already believed in God and saw no need to eliminate suggestions of design might be inclined to reject these suggestions as metaphysically extravagant.) But there are also counterarguments here; the discussion goes on. It is hard to see a verdict, at present, on the prospects of this form of the argument. The teleological argument seems to have enormous vitality; its epitaph is often read, but the argument regularly reappears in new forms. As for a final evaluation, the best perhaps comes from Kant, who said that this argument 'always deserves to be mentioned with respect. It is the oldest, the clearest and the most accordant with the common reason of mankind' (1787: 520).

6 Other theistic arguments

We have examined the Big Three among theistic arguments, but there are many more. First, there are moral arguments of at least two sorts. These are arguments that the very nature of morality - the unconditioned character of the moral law - requires a divine lawgiver. You might find yourself utterly convinced that:

Morality is objective, not dependent upon what human beings know or think or do.

You may also be convinced that:

The objective character of morality cannot be explained in terms of any 'natural' facts about human beings (or other things), so there could not be such a thing as objective moral law unless there were a being like God who legislates it.

Then you will have a theistic argument from the nature of morality. This argument can go in either of two directions: some people think we can simply *see* that moral obligation is impossible apart from a divine will and lawgiver, while others think that the dependence of moral obligation upon the will of God is the best explanation for its objectivity and special deontological force.

A second main type of moral argument is due to Kant (1788), who argues first that virtue deserves to be proportionally rewarded with happiness: the more virtuous you are, the more happiness you deserve. But nature by itself does not seem able to guarantee anything like this sort of coincidence. If morality is to make sense, however, it must be supposed that there is such a coincidence; practical reason, therefore, is entitled to postulate a supernatural being with enough knowledge, power and goodness to ensure that we receive the happiness we deserve as a reward for our virtue. So taken, the argument is for the rationality of making the assumption that there is a being of this sort; it is not really an argument for the actual existence of such a being. This argument receives criticism from several sides: some hold that we do not have to assume that there is proportionality between virtue and happiness in order to carry out the moral life; others (for example, many Christians) argue that both happiness and the ability to live a moral life are gifts of grace and that if we really got what we deserve, we should all be thoroughly miserable.

There are many other theistic arguments - arguments from the nature of proper function, from the nature of propositions, numbers and sets, from intentionality, from counterfactuals, from the confluence of epistemic reliability with epistemic justification, from reference, simplicity, intuition, love, colours and flavours, miracles, play and enjoyment, morality, beauty, the meaning of life, and even from the existence of evil. There is no space even to outline all these arguments, so we will look at just three.

First, the argument from intentionality (or aboutness). Consider propositions - the things that are true or false, that are capable of being believed, and that stand in logical relations to one another. Propositions have another property: *aboutness* or *intentionality*. They represent reality or some part of it as being thus and so, and it is by virtue of this property that propositions (as opposed, for example, to sets) are true or false. Most who have thought about the matter have found it incredible that propositions should exist apart from the activity of minds. How could they just *be* there, if never thought of? Further, representing things as being thus and so - being about something or other - seems to be a property or activity of minds or perhaps thoughts. It is therefore extremely plausible to think of propositions as ontologically dependent upon mental or intellectual activity in such a way that either they just *are* thoughts, or else at any rate could not exist if not thought of. But propositions cannot be human thoughts; there are far too many of them for that. (For each real number *r*, for example, there is the proposition that *r* is distinct from the Taj Mahal.) Hence the only viable possibility is that they are divine thoughts, God's thoughts (so that when we think, we literally think God's thoughts after him).

Second, there is the argument from sets or collections. Many think of sets as displaying the following characteristics: (1) no set is a member of itself; (2) sets (unlike properties) have their extensions essentially - hence many sets are contingent beings and no set could have existed if one of its members had not; (3) sets form an iterated structure - at the first level, there are sets whose members are nonsets, at the second, sets whose members are nonsets or first level sets, …, at the *n*th level, sets whose members are nonsets or sets of index less than *n*, …, and so on.

It is also natural to follow Georg Cantor, the father of modern set theory, in thinking of sets as collections - that is, as things whose existence depends upon a certain sort of intellectual activity, a collecting or 'thinking together' as Cantor put it. If sets were collections, that would explain their having the first three features. But of course there are far too many sets for them to be a product of human thinking together; there are many sets such that no human being has ever thought their members together and many such that no human being *could* think them together. That requires an infinite mind - one such as God's.

For a third example, consider the argument from appalling evil. Many philosophers offer antitheistic arguments from evil, and perhaps they have some force. But there is also a *theistic* argument from evil. The premise is that there is real and objectively horrifying evil in the world. Examples would be certain sorts of appalling evil characteristic of Nazi concentration camps: guards found pleasure in devising tortures, making mothers decide which of their children would go to the gas chamber and which be spared; small children were hanged, dying (because of their light weight) a slow and agonizing death; victims were taunted with the claim that no one would ever know of their fate and how they were treated. Of course, Nazi concentration camps have no monopoly on this sort of evil: there are also Stalin, Pol Pot and a thousand lesser villains. These states of affairs, one thinks, are objectively horrifying, in the sense that they would constitute enormous evil even if we and everyone else came perversely to approve of them.

Naturalism does not have the resources to accommodate or explain this fact about these states of affairs. From a naturalistic point of view, about all one can say is that we do indeed hate them; but this is far short of seeing them as intrinsically horrifying. How can we understand this intrinsically horrifying character? After all, as much misery and suffering can occur in a death from cancer as in a death caused by someone else's wickedness. What is the difference? The difference lies in the perpetrators and their intentions. Those who engage in this sort of evil are purposely and intentionally setting themselves to do these wicked things. But why is that objectively horrifying? A good answer (and one for which it is hard to think of an alternative) is that this evil consists in defying God, the source of all that is good and just, and the first being of the universe. What is horrifying here is not merely going contrary to God's will, but consciously choosing to invert the true scale of values, explicitly aiming at what is abhorrent to God. This is an offence and affront to God; it is defiance of God himself, and so is objectively horrifying. Appalling evil thus has a sort of cosmic significance. But of course there could be no evil of this sort if there were no such being as God.

God, concepts of

We think of God as an ultimate reality, the source or ground of all else, perfect and deserving of worship. Such a conception is common to both Eastern and Western religions. Some trace this to human psychology or sociology: Freud regarded God as a wish-fulfilling projection of a perfect, comforting father-figure; Marxists see belief in God as arising from the capitalist structure of society. Believers, however, trace their belief to religious experience, revealed or authoritative texts, and rational reflection.

Philosophers flesh out the concept of God by drawing inferences from God's relation to the universe ('first-cause theology') and from the claim that God is a perfect being. 'Perfect-being' theology is the more fundamental method. Its history stretches from Plato and Aristotle, through the Stoics, and into the Christian tradition as early as Augustine and Boethius; it plays an important role in underwriting such ontological arguments for God's existence as those of Anselm and Descartes. It draws on four root intuitions: that to be perfect is perfectly to be, that it includes being complete, that it includes being all-inclusive, and that it includes being personal. Variously balanced, these intuitions yield our varied concepts of God.

Criticisms of perfect-being theology have focused both on the possibility that the set of candidate divine perfections may not be consistent or unique, and doubts as to whether human judgment can be adequate for forming concepts of God. Another problem with the method is that different accounts of perfection will yield different accounts of God: Ibn Sina and Ibn Rushd, for instance, appear to have held that God would be the more perfect for lacking some knowledge, while most Christian writers hold that perfection requires omniscience.

Views of God's relation to the universe vary greatly. Pantheists say that God is *the universe. Panentheists assert that God includes the universe, or is related to it as soul to body. They ascribe to God the limitations associated with being a person - such as limited power and knowledge - but argue that being a person is nevertheless a state of perfection. Other philosophers, however, assert that God is wholly different from the universe.*

Some of these think that God created the universe ex nihilo, *that is, from no pre-existing material. Some add that God conserves the universe in being moment by moment, and is thus provident for his creatures. Still others think that God 'found' some pre-existing material and 'creates' by gradually improving this material - this view goes back to the myth of the Demiurge in Plato's Timaeus, and also entails that God is provident. By contrast, deists deny providence and think that once God made it, the universe ran on its own. Still others argue that God neither is nor has been involved in the world. The common thread lies in the concept of perfection: thinkers relate God to the universe in the way that their thoughts about God's perfection make most appropriate.*

1 The logic of 'God'

We use the term 'God' in two main ways. We use 'God' to address God, as in prayer. So used, 'God' seems like a proper name. We also use 'God' like a general predicate. For we can and do ask whether there is more than one God: the concept of God allows this question a 'yes' answer. The concept of Moses does not allow a 'yes' answer to 'was there more than one Moses?' One cannot use proper names this way, for there cannot have been two Moseses. If 'two' people are identical with Moses, they are one person, not two. 'Was there more than one Moses?' makes sense only taken as 'was there more than one man called Moses?' or 'did one person do the deeds in the Moses story, or does the story conflate the deeds of many men?'

The ambiguity between name and predicate suggests that 'God' is a title-term, like 'Pastor' or 'Bishop'. Many people can be bishops; in this way title-terms are like general predicates. But one can also address the office-holder by the title ('Dear Bishop…'); one can use the title as a name for the person who holds the office. Thus, the concept of God is a concept of an individual holding a special office.

Thinkers have disagreed about what this office is. Aquinas (§9) suggests that to be God is to have providence over all (*Summa theologiae* Ia, q.13, a.8). But without obviously contradicting themselves, some philosophers (such as Aristotle (§16) and Plotinus (§§3-5)) deny that God provides for creatures. Some say that to be God is to deserve worship. But arguably one's act cannot be an act of worship if one does not take its object to be truly divine, and something cannot deserve worship if it is not divine. If either of these claims is true, 'to be God is to deserve worship' amounts to something like 'to be God is to deserve to be treated as God' - which is true but not helpful.

The suggestion that this entry will explore is that the role or office of God is that of ultimate reality, than which no reality is more basic. Consider some claims on which Eastern and Western religions agree:

(1) Nothing made God; anything that was made is not God.
(2) God is the source or ground of all that is not God.

Eastern and Western religions also agree that God is the Supreme Being. They use 'supreme' to speak of God's perfection and authority and so agree that:

(3) God rules all that is not God.
(4) God is the most perfect being.

(1)-(4) are necessary truths *de dicto*; they state requirements for counting as God. All express facets of God's ultimacy. (1) states that nothing is causally more basic than God. On (1), no account of why things exist can go beyond God; if God explains anything, God is an ultimate explainer. On (2), all explanations of existence do in fact terminate in God. On (3), God has ultimate control over all things; on (4), God is ultimate in perfection. If (1)-(4) are near the core of the concept of God, so is ultimacy.

Quite diverse religious contexts tie ultimacy and deity. Revelation 21: 12 calls God 'the Alpha and the Omega, the beginning and the end'. To be last is to be ultimate. That is first to which nothing is prior. So being first is also a way to be ultimate, and being first is a prerequisite of being taken as God. John Chrysostom comments that 'men most honour the eldest of beings which was before all, and account this to be God' (*Homilies on St John* [1994: 7]). Pantheists claim not to twist the meaning of 'God' in calling the universe 'God' because, as they see it, the universe is the ultimate reality; there is nothing beyond it. Even believers in many gods sometimes distinguish mere gods from God on grounds of ultimacy. Thus, Hindus see their many *devas* (gods) as finally just creations and manifestations of the one ultimate being, Brahman (see God, Indian conceptions of); and Proclus (§4), a Neoplatonic polytheist, writes that:

> God and the One are the same because there is nothing greater than God and nothing greater than the One…[Plato's] Demiurge is a god, not God. The god that is the One is not a god, but God simply.
>
> (*Commentary on Plato's Parmenides* 641-3)

Proclus' One counts as God precisely because it is, in Proclus' view, the ultimate reality. Tillich (§§2-3) sums it up: 'Only [an] ultimate reality can…be our unconditional concern [that is, a genuine God]. Faith in anything which has only preliminary reality is idolatrous' (1955: 59). Thus, concepts of God are concepts of what the ultimate reality is and how it is related to the rest of reality.

2 Data and methods

Human beings draw their views of God from religious experience, revealed or authoritative texts, and rational reflection. The third is, in a way, basic. Not all seeming experience of God is genuine. Texts and philosophical thought help sort the true from the illusory. Then, too, the genuine experiences of God, once found, do not wear their meanings on their sleeves. They need interpretation, which texts and reason provide. Finally, authoritative texts themselves need interpretation, and reason provides this. So religious experience and authoritative texts are data, which philosophical and theological reasoning work into fully articulate theories of the nature of God.

Some trace views of God to still other sources. For example, Freud argued that belief in God is a form of wish-fulfilment, in which human beings give themselves the protected, loved feeling of an idealized childhood by projecting into reality a vision of a perfect, benevolent father-figure who will make everything right in the end. Other psychologists take a still dimmer view of God, seeing him as not a comforting dream but the projection into reality of neurotic self-loathing; they see belief in divine judgment (for example) as a form of self-persecution. Durkheim(§4) (1915) regarded the concept of God as a symbol expressing society's role in our lives. Marxists see this role as oppressive, at least under capitalism, and so see concepts of God as reflecting and reacting to social evils. On their view, belief in God is doomed to wither away when society progresses.

These are all speculations, and beliefs may be true even if one can explain our holding them in purely psychological or sociological terms. But still, theists claim that reason, experience and authority yield *warranted*

belief. On some views, beliefs are warranted only if their sources are reliably truth-producing ways of forming beliefs. Wish-fulfilment and neurosis-expression are not reliably truth-producing ways of forming beliefs. So, on these views of warrant, a persuasive psychological or sociological explanation of apparent religious experience or the intuitions that guide theistic reasoning could undermine theists' claims to warranted belief. Again, some think a belief warranted only if one holds it for the right kind of reason. 'To feel good' is not the right kind of reason.

Still, the concept of God gives as much grist to wish-fulfilment as to self-persecution or Marxist theories. Consequently, the two sorts may cancel out: the facets of God which count *for* the one count *against* the other. Belief in God cannot both comfort and torment us. It can at most comfort one part of us and torment another part. But the more elaborate the genetic account of theism's attractions, the less plausible the account becomes. Furthermore, one can give equally unflattering accounts of the appeal of atheism, Freudianism and Marxism. If so, the genetic argument again cancels out.

Western philosophy works up theories about God in two main ways. *First-cause theology* draws out implications of God's relation to the universe. *Perfect-being theology* reasons out consequences of the claim that God is a perfect being. Each method gets at part of God's ultimacy. First-cause theology explores God's causal ultimacy. Perfect-being theology explores God's ultimacy in value. Most religious thinkers use both methods. Aquinas, for instance, sets up his basic descriptions of God by giving five ways to argue for God's existence (*Summa theologiae* Ia, q.2, a.3). The first three ways argue the existence of a first cause, the fourth that of a perfect being, and the fifth that of an intelligent designer of nature. Aquinas then argues that a first cause must be purely actual and so perfect and uses both perfect-being and first-cause theology to work out his concept of God.

Perfect-being theology is the more basic theological method. In the West, for instance, first-cause theology often explicates and/or argues the claim that God created the universe *ex nihilo* (see Creation and conservation, religious doctrine of §§1-2). But while Western Scriptures say that God created the universe, they do not so clearly state that God made it *ex nihilo*. The most famous biblical passage on creation is Genesis 1: 1-2: '[1]In the beginning God created the heavens and the earth. [2]Now the earth was formless and empty, darkness was over the surface of the deep, and the Spirit of God was hovering over the waters.' Verse 1 could assert a creation *ex nihilo*, with verse 2 describing that act's initial result. But verse 1 could just be a topic statement for the overall creation story, which might begin in verse 2. In that case, in the story, God finds some initial chaotic state of things, and creates a universe by forming or moulding that chaos into the structured world we now inhabit. This second reading does not involve creation *ex nihilo*. It is perfect-being theology that leads Western thinkers to take creation as *ex nihilo*; by doing so, they magnify things' dependence on God and God's importance for and superiority to the universe. We ought, then, to focus on perfect-being theology.

3 Perfect-being theology

Perfect-being theology has a long history. Plato (§14) assumes that gods are 'the…best possible' to argue that they are immutable (*Republic* II, 381c). To work out the nature of God, Aristotle takes as a premise that God is 'the best substance' (*Metaphysics* XII, 9, 1074b). Cicero (§3) records the perfect-being arguments of the early Stoic Zeno of Citium:

> That which is rational is better than that which is not rational. But nothing is better than the cosmos. Therefore the cosmos is rational. One can prove in a similar manner that the cosmos is wise, happy and eternal, since all of these are better than things which lack them, and nothing is better than the cosmos.
>
> (*On the Nature of the Gods* II, 21)

Zeno plainly envisages many applications of this basic argument form:

(5) Whatever is *F* is more perfect than whatever is not *F*.
(6) Whatever is most perfect is more perfect than everything else.
(7) So whatever is most perfect is *F*.
(8) *X* is most perfect.
(9) So *X* is *F*.

The project of filling out a concept of God by successive applications of (5)-(9) is a version of perfect-being theology. To many, Zeno's taking 'the cosmos' as a value of *X* in (8) will look odd. Cicero's case for Zeno is that

‘since the cosmos includes everything and since there is nothing which is not in it, it is perfect in all respects’ (*On the Nature of the Gods*). Cicero’s thought is perhaps this: the cosmos is composed of other objects, its parts. So the cosmos’ perfection is the sum of its parts’ perfections, and thus it is greater than the perfection of every object it contains. But the cosmos contains every object other than itself. So the cosmos is the most perfect actual being.

Cicero seems even to think that the cosmos is the most perfect *possible* being:

> Nothing at all is better…than the cosmos. Not only *is* nothing better, but nothing can even be conceived of which is better. And if nothing is better than reason and wisdom, it is necessary that these be present in that which we have granted to be the best.
>
> (*On the Nature of the Gods* II, 18)

Reasoning out the nature of a greatest *possible* being is another form of perfect-being theology. Taking the cosmos as the greatest *possible* being, Cicero applies to ‘reason’ and ‘wisdom’ a form of argument which, like (5)-(9), yields a general theological programme. Why might Stoics call the cosmos the most perfect possible being? Suppose that to be a cosmos is to be all-inclusive, a sum of all other things. If so, then no matter what, if anything exists, a cosmos also exists: there is a sum of all things, and this sum is the most perfect actual thing. Suppose we now add that no matter what objects made it up, the cosmos which existed would be the same individual cosmos as the one which now exists. It then follows that the cosmos is the greatest possible being, in the sense that no matter what possible things existed, our cosmos would be greater than any of them. Stoics may have thought this way (see Stoicism §§3-5).

The Christian tradition invokes perfect-being theology at least as early as Augustine (§7), who wrote: ‘When we think of…God…thought takes the form of an attempt to conceive something than which nothing more excellent or sublime exists’ (*Christian Doctrine* I, 7, 7). Augustine tells us to construct a concept of God by seeking a concept of the most perfect being there is. He adds two concrete rules. One is to deny God whatever attributes we think to be imperfections, the other is to affirm of God in the highest degree any attributes we find to be perfections (*On the Trinity* V, 1, 2; XV, 4, 6).

Boethius (§5) stated an axiom stronger than Augustine’s, that God is such that nothing greater than him is even conceivable (*The Consolation of Philosophy* III, 10). Anselm of Canterbury (§§3-4) at first based his perfect-being theology on Augustine’s axiom, that God is the greatest actual being (*Monologion*, chaps 1-3). To fill out the concept of God, Anselm directed, ascribe to God all attributes *F* such that whatever is *F* is better than whatever is not *F* (*Monologion*, ch. 15). Thus Anselm’s *Monologion* recaps Zeno’s theological programme. In his *Proslogion*, Anselm switches to Boethius’ axiom, and suggests filling out the concept of God by many arguments of this form:

(10) Nothing greater than God is conceivable.
(11) If God is not *F*, something greater than God is conceivable.
(12) So God is *F*.

Replacing ‘is conceivable’ with ‘is possible’ yields a form of argument theistic philosophers still respect. Replacing ‘*F*’ with ‘existent’ yields Anselm’s ontological argument for God’s existence (see God, arguments for the existence of §2).

4 Limits of perfect-being theology

Duns Scotus’ gloss on Boethius’ axiom calls God the greatest being conceivable without contradiction (*On the First Principle*, 4.65) (see Duns Scotus, J. §§7-11). So perhaps Duns Scotus saw a question Leibniz (§3) was to raise explicitly: what if some values of *F* are incompatible? What if nothing can have all values of *F*? Perfect-being theology replies: if so, God has a set of compatible attributes *S* which does not include all values of *F*, such that nothing can be greater than a thing with all members of *S*. This raises another question. Suppose that there is such a set. There may also be a second set *T* such that nothing can be greater than a thing with all members of *T*, but either an *S*-God would be just as great as a *T*-God or an *S*-God would be neither greater than, less great than nor as great as a *T*-God. What then? Perfect-being theology can say that God has any attributes common to *S* and *T* and can try to decide between *S* and *T* on further grounds, but may have to settle for saying that God has either *S* or *T*. There is no guarantee that perfect-being theology alone can fill out the concept of God.

The metaphysics one brings to perfect-being theology affects one's conclusions. The Stoics agreed with Christians that being an agent is a perfection. But the Stoics thought that only material things can act. They inferred that God must be material and so must be the most perfect material thing, the cosmos. Being perfect is being maximally good, and so thinkers' intuitions about what is perfect can differ and be as hard to reconcile as their intuitions about what is good. But perfect-being theology yields divergent results when those who do it do not share intuitions about what it is to be perfect. Anselm, a Christian, thought that a perfect being must be all-knowing (*Proslogion*, ch. 6). But Alcinous, a second-century Platonist, held that all God's ideas are 'eternal and perfect' and therefore denied that God has ideas - or therefore knowledge - of disease, artefacts, dirt or individuals as such (*The Handbook of Platonism*, 9.2, 7; 11.27-31). Ibn Sina and Ibn Rushd too seem to have thought that a perfect being has some but not all knowledge - that there is knowledge that is not good, so that God is more perfect without it (see Ibn Rushd §2). It is not clear that perfect-being theology can adjudicate such differences. So while it may help one work out one's own concept of God, perfect-being theology may have less promise as an avenue of theological agreement. This might in turn cast doubt on perfect-being theology's ability to give theological beliefs *warrant*.

Some theists reject perfect-being theology. Plotinus held with Plato that goodness is 'superior to being' (*Republic* VI, 509b). He thus refused to use perfect-being theology to explicate his view of the truly ultimate God, the One or Good; Plotinus' 'perfect being' is his second, subordinate god, *Nous*, the divine mind. For Plotinus, then, being truly ultimate is incompatible with being the subject of perfect-being theology. Theists who hold that God is utterly ineffable or entirely beyond our conceptual grasp doubt that perfect-being theology's development of human concepts of perfection can really explicate God's nature. As one's concept of perfection reflects one's concept of goodness, theists in the tradition of Augustine and Calvin (§§2-3), who emphasize the corrupting effects of sin on the human power to judge what is good, find perfect-being theology radically unreliable. Freudian views of religious belief can also question perfect-being theology, for it can look like explicit, conscious wish-fulfilment: is it not a way of ascribing to God a 'wish list' of perfections? Finally, those who criticize the ontological argument for God's existence may also criticize perfect-being theology. For perfect-being theology underwrote the ontological argument in Anselm and Descartes (§6), and its connection with that argument is not accidental. Perfect-being theology claims in effect that in God's case, 'ought' implies 'is', and one thing God ought to be is existent.

5 Intuitions about perfection

Four intuitions about what it is to be perfect are found in the history of philosophical theology. One is that to be perfect is perfectly to be, and so draws on an account of what it is to *be*. We find this account and its consequences in Parmenides (§6) and in Plato's account of his Forms. Augustine puts it this way:

> Something which changes does not retain its own being. A thing which can change, even if it does not change, cannot be what it had been. So only what does not only not change but also cannot at all change falls most truly…under the category of being.
>
> (*On the Trinity* V, 2-3)

A God perfect in this way must be wholly discrete from the universe: the universe changes, God does not.

The Latin root of 'perfect', *perficio*, has the sense of 'complete'. Thus, a second perfection-intuition has been that what is perfect lacks nothing, is fully self-sufficient, and so is independent of all else. If persons by nature change, are finite or incomplete in various ways, or require others for their full flourishing, a God whose perfection reflects these first two intuitions may be personlike, but is not in the ordinary sense a person. A third intuition is that what is perfect, being complete, is all-inclusive. Classical theism takes God to be all-inclusive in perfection. Thus, Aquinas argues that if a being lacks some perfection, it is not a God (*Summa theologiae* Ia, q.11, a.3). The Stoics and Parmenides took being perfect as being all-inclusive and reasoned that as all-inclusive, a perfect being must include the universe. One way to develop this thought holds that God is the universe, and so sees God as impersonal. A second way to develop this view sees God as including, but also as being 'more than', the universe, just as persons include but are more than their bodies. The last intuition takes persons as the standard of perfection, and so insists that any perfect being must know, will and (according to some philosophers) feel.

Below is a survey of some of the main concepts of God that these intuitions have yielded.

6 Classical theism

Classical theism's ancestry includes Plato, Aristotle, Middle Platonism and Neoplatonism. It entered Judaism through Philo of Alexandria (§4), reaching its apogee there in Maimonides (§3). It entered Christianity as early as Irenaeus and Clement of Alexandria and became Christian orthodoxy as the Roman Empire wound down. Though more and more challenged after 1300, it remains orthodox. Classical theism filtered into Islam as early as al-Kindi (§§1-2). Al-Ghazali attacked it as the view of Islamic Aristotelians, and it suffered in Islamic orthodoxy's successful reaction against Aristotle.

Much of classical theism's concept of God unfolds from the claim that God is the ultimate reality. According to classical theism, God is:

A se - wholly independent of all else. God is absolutely the first being. He exists before there is anything else for him to depend on. So he must need or depend on nothing in any way other than himself. (Classical theism sits well with intuitions that, as perfect, God is self-sufficient.)

Simple - completely without parts. Whatever has parts depends on them for its existence and nature; bricks make a wall and make it what it is. So a God wholly *a se* has no parts (see Simplicity, divine).

Having no parts, God is:

Immaterial - whatever is made of matter has parts, for the matter of which it is made has parts. So a partless God cannot be made of matter, or include matter in any way which makes its parts his.

Not spatially extended - whatever extends through space has parts covering the parts of the space through which it extends (or so most think).

Without accidents - lacking non-relational contingent attributes. If God has attributes distinct from himself, he depends on them for his nature and existence. So if he is entirely *a se*, he has no such attributes: God's attributes = God. Nothing can be identical with a contingent attribute. For if one has an attribute contingently, one can only be contingently identical with it. But all genuine identities are necessary. So God has no accidents.

If so, God is:

Immutable - or unable to undergo real, intrinsic change. For real, intrinsic change is change in accident (see Immutability).

If *a se*, God is also:

Impassible - unable to be affected by beings other than himself. For if we affected God - if, say, our suffering made him sorrowful - his emotional state would depend on us, and so God would not be wholly *a se*.

According to classical theism, God is also:

Eternal - in the sense of timeless, that is, alive without past or future, living a life neither containing nor located in any series of earlier and later events. Much traditional perfect-being theology converges on this claim. Boethius, for instance, argued that a perfect being must be timeless because timeless existence is superior to temporal existence. Temporal beings lose their pasts and lack their futures, and so enjoy only an instant-thin slice of their existences at any one time. Timeless life has no past or future. A timeless being enjoys its entire life in one timeless present. Thus Boethius saw timeless life as 'the all-at-once and perfect possession of interminable life' (*The Consolation of Philosophy* V, 6), and so most appropriate to a perfect being (see Eternity).

Necessarily existent - perfect-being theology yields divine necessity. To exist contingently is to be able not to exist. A being is more perfect if wholly immune to nonexistence (see Necessary being).

Omnipresent - present in all space and time, though not contained by either (see Omnipresence). This follows via perfect-being theology: a God not in some way everywhere and everywhen would be more limited and less perfect than a God with these attributes. As creator and sustainer, God is present everywhere and everywhen in the sense that he sustains in being and knows immediately every place and time and their contents.

Classical theism thinks God personal enough to have intellect and will. Perfect-being theology backs this if

nothing incompatible with intellect and will adds more value to the concept of God. If God has intellect and will, perfect-being theology ascribes to him also the perfect versions of these.

Perfect intellect includes *perfect wisdom and rationality* and *perfect knowledge*. It thus includes omniscience, variously defined as knowing all truths and/or all facts, or all that is knowable, or having the greatest amount of knowledge possible for a single individual (see Omniscience). Classical theism typically holds that God's knowledge includes knowledge of free creaturely actions that, with respect to us, are future; this raises the question of how such knowledge is compatible with creaturely freedom. Perfection in knowledge also includes having knowledge in the best possible way (perhaps immediately rather than inferentially, or by direct intuition of fact rather than through grasping some representation such as a proposition) and on the best possible grounds. As perfectly wise or rational, God makes optimal use of his knowledge.

Perfect will includes *perfect power* and *perfect goodness*. Perfect power includes omnipotence, defined roughly and with some qualifications as the power to actualize any broadly logically possible state of affairs (see Omnipotence). Perfect goodness includes always acting as moral norms dictate, doing great supererogatory good and having perfect versions of at least some moral virtues (justice, mercy, altruistic love). The claim that God is perfect in knowledge, power and goodness sets up the various versions of the problem of evil (see Evil, problem of). The simplest version is this: if God knows that and when each evil will occur if he does not intervene, and God has the power to prevent each evil, and God is perfectly good and so does not approve of evil, how then can evil occur?

Classical theism constrains what we make of God's personal attributes. For instance, if wholly *a se*, God cannot know creatures by observing them, since states of observational knowledge causally depend on the objects observed. If I know that Fido is here by seeing Fido, then as Fido helps cause my seeing, Fido helps cause my knowing. Perfect-being theism also affects our view of God's personal attributes. It would be better to be necessarily omniscient, omnipotent and so on than merely contingently so. So perfect-being theism pushes us to say that God has necessarily his personal perfections. This can raise questions about, for example, God's goodness: some argue that if God necessarily does no wrong, he does not qualify as a morally responsible agent (see Freedom, divine).

Classical theism holds God wholly discrete from the world in substance. Classical theists differ over God's relation to the world. Aristotle held that God is merely a final cause, a lure who draws the universe's efficient causes into action (*Metaphysics* XII, 6-7). But most classical theists hold that God efficiently causes the world to exist by creating it from no pre-existing material; classical theists often compare this with our thinking up imaginary worlds just as we choose (without implying that the universe is a figment of God's imagination).

Most classical theists hold that God created freely and directly rather than via an intermediary. Other classical theists demur. Plotinus, for instance, argued that his ultimate reality, the One, creates necessarily (*Enneads* II, 9, 3), and has as its direct effect only a second deity, the divine mind, which creates all 'lower' beings. Both claims have had later partisans in classical theism - for example, such Arabic Aristotelians as Ibn Sina and Ibn Rushd.

Most classical theists who hold that God creates also hold that God conserves the world - that is, they hold that the universe depends on God for its being not merely in its first instant of existence (if any), but equally throughout its duration. For classical theists, God would not have to do anything positive to annihilate the universe. He would merely have to stop doing what he is always doing to keep it in existence. As a book falls to the floor once a supporting hand is withdrawn, so the world would fall back into nothingness were God's supporting power withdrawn (see Creation and conservation, religious doctrine of §5). If God conserves the world, God also is provident for his creatures, at least in keeping in being the things they need. Creation and conservation raise again the problem of evil: if all things stem from God and God actively preserves them, how can God avoid responsibility for the evils things bring?

Classical theism's God is infinite or unlimited in not depending on other things, and in perfection, power, knowledge, goodness and creative responsibility. Thus, to some, the God of classical theism is personlike but not a person (as some say of Brahman, conceived as being, consciousness and bliss). Some have denied classical theism because they see God as limited in some of these ways and more like the persons we know. Some deists denied divine providence, and perhaps conservation (see Deism §§1-2). Plato held that the Demiurge 'found' a disordered

cosmos, and 'created' only by bringing it into better order (*Timaeus*, 30a), thus freeing him from responsibility for evil (*Republic* II, 379c). Theists such as John Stuart Mill and William James (§4) tried to free God of this responsibility by supposing that God has only limited power and/or knowledge.

7 Pantheism

Pantheism consists of two theses: that (a) all things are parts of, appearances of or really identical with some one being, and (b) this being is divine. Claim (a) is compatible with the view that all items not identical with this one being are unreal, or ultimately unreal, but does not entail it. Nor does (a) entail (b), for one who holds that there is just one really real or all-inclusive thing need not treat it as divine. Still, if there is just one thing, or an all-inclusive thing, that thing is the ultimate thing, and has a claim to be the most perfect thing. So given the tie between ultimacy and deity and the tradition of perfect-being theism, those who hold (a) naturally tend towards (b).

Reverence for nature and mystical experiences of the unity of all things are a perennial source of pantheism, the former persuasive to nineteenth-century Romantics, the latter to Eastern thinkers. Once tilted towards this view of God, pantheists sometimes argue that their Unity has some attributes classical theism calls distinctively divine. Stoics argue that the universe is conscious and wise, Spinoza (§§2-4) that the one universal substance is simple, Hegel that the world-spirit exercises a kind of providence, and some contemporary philosophers that the universe viewed tenselessly exists independently and is eternal. The universe is certainly omnipresent in the sense that every place is part of it, though not as in classical theism (in which God is present *as a whole* in every place and time). In pantheism, God = universe, and so the claim that God and universe are causally related is problematic. Spinoza tries to preserve an efficient-causal relation by distinguishing an active aspect of the universe (*natura naturans*) from a passive (*natura naturata*). Hegel sees God as the universe's final cause, claiming that full realization of its divine nature is the goal towards which the universe's development moves.

The line between pantheism and panentheism is narrow. Pantheism holds that God is the sum of, the reality behind or the true identity of all things, and nothing beyond this. If a being with awareness and/or will is in some way more than its body, then a view can remain pure pantheism only by denying that God is a person or personlike, and many thinkers usually called pantheists (for example, Spinoza, the Stoics, some Hindus) may actually have been panentheists. Many find pantheism's implications distasteful. If everything is part of God, or an aspect of him, and so forth, then God includes or really is the most unsavoury items, and (for example) whoever eats, chews on God. Thus 'pantheist' often serves as a term of theological abuse, and not everyone given the label deserves it.

8 Panentheism

Panentheism can be traced back at least to the Hindu thinker Rāmānuja (§3); its chief twentieth-century friends have been 'process philosophers' (see Process theism). Panentheism seeks a middle ground between classical theism and pantheism, preserving the former's claim that God has intellect and will and the latter's sense of intimate connection between God and universe. In panentheism, God is a person who includes the universe, or a soul whose body is the universe. Thus, God is larger than but also like the persons we know: physically embodied in a finite material object, growing older through time and changing as his material parts change. Panentheists claim that even so, God is perfect, because persons are the acme of perfection. Panentheists deny that God is immaterial; most also affirm that he has spatial extension, and offer their own distinctive slants on other traditional divine attributes.

The panentheist's God includes other things, and so depends on them. Such a God is thus not *a se* in the classical sense. But such a God may still be more independent than anything else. He depends only on things he includes, in contrast to depending on things that include him or that lie beyond him. Some panentheists (such as Charles Hartshorne) see some sorts of dependence as perfections. Compassion and sympathy are (they argue) moral perfections that involve having feelings that depend on others' fortunes, and all knowledge depends on the objects known. The panentheist's God has the complexity of the universe and changes as it does. But some panentheists (such as Hartshorne) maintain that God's abstract nature is simple, while Rāmānuja sites all complexity in God's body, the universe, holding that God's inner self, the pure Brahman, is partless. Hartshorne and Rāmānuja claim that God is immutable in certain respects, Hartshorne that his basic character (perfect benevolence, and so forth) cannot change, Rāmānuja that all change occurs in God's body, the universe, not in Brahman proper. Panentheists

hold that God is eternal in the sense of everlasting in time; Hartshorne defends a version of the ontological argument, contending that God exists necessarily. Process panentheists usually claim that God cannot know the future, as it is indeterminate and so unknowable, and that God's power, while greater than any other being's, is not literally omnipotence. In this they follow Plato, whose Demiurge seeks to mould the world into a better place, but is limited by the recalcitrant material with which he works.

God, Indian conceptions of

*In the Ṛg Veda, the oldest text in India, many gods and goddesses are mentioned by name; most of them appear to be deifications of natural powers, such as fire, water, rivers, wind, the sun, dusk and dawn. The Mīmāṃsā school started by Jaimini (*c. AD *50) adopts a nominalistic interpretation of the Vedas. There are words like 'Indra', 'Varuṇa', and so on, which are names of gods, but there is no god over and above the names. God is the sacred word (mantra) which has the potency to produce magical results. The Yoga system of Patañjali (*c. AD *300) postulates God as a soul different from individual souls in that God does not have any blemishes and is eternally free. The ultimate aim of life is not to realize God, but to realize the nature of one's own soul. God-realization may help some individuals to attain self-realization, but it is not compulsory to believe in God to attain the* summum bonum *of human life. Śaōkara (*c. AD *780), who propounded the Advaita Vedānta school of Indian philosophy, agrees that God-realization is not the ultimate aim of human life. Plurality, and therefore this world, are mere appearances, and God, as the creator of the world, is himself relative to the concept of the world. Rāmānuja (traditionally 1016-1137), the propounder of the Viśiṣṭādvaita school, holds God to be ultimate reality, and God-realization to be the ultimate goal of human life. The way to realize God is through total self-surrender to God. Nyāya theory also postulates one God who is an infinite soul, a Person with omniscience and omnipresence as his attributes. God is the creator of language, the author of the sacred Vedas, and the first teacher of all the arts and crafts.*

1 Mysticism in the *Ṛg Veda*

The Vedic texts (*c.*2000-1500 BC) suggest that divinity permeates the whole universe, the fields, the crops, animals, human speech, and so on. This conception involves many gods and goddesses, but it is not polytheism, for each god or goddess is praised as the supreme deity in the verses addressed to them. Max Müller has coined the term 'henotheism' to denote systems where the position of supreme deity is occupied now by one god or goddess, then by another, and so on (see Chatterjee and Datta 1984). No more than one god is ever worshipped at a time. There is also an emphasis on monotheism, pantheism and mysticism; the different gods and goddesses are said to be different only in name.

It is often claimed that the *Ṛg Veda* (*c.*200 BC) represents nature worship, polytheism and a rather crude imagery of gods and goddesses. This claim is certainly unjustified, for all through the *Ṛg Veda* there is a sense of all-pervasive divine presence, immanent in humanity and nature, unifying the universe and illuminating it. To the seers (*ṛṣis*) of the *Ṛg Veda*, nature is a living divine presence with which they can have communion and be existentially united. They worship the sun, the moon, the dawn, the night, the firmament, fire, water, rivers, seasons, herbs, trees, forests, the grass, furrows, agriculture, mountains, stones, wind and so forth not as mere natural forces, not as anthropomorphic gods and goddesses, but as the various expressions of one divine foundational reality. 'The real is one, the learned call it by various names: Agni, Yama, Mātariśvan' (*Ṛg Veda* 1.164.46). The only mode of worship is performing sacrifices to gods and goddesses. It is not merely that the gods are one, but that the whole of the universe in its physical, material and natural aspects is permeated by one divine presence. Even in the description of the horse sacrifice (1.162), the entire sacrifice, the apparent victim, all the implements used and actions performed are united in the all-comprehending divine presence. The result of this sacrifice, too, is all-pervasive, mundane as well as spiritual.

The whole of *Ṛg Veda* 1.164 is permeated with a sense of divine unity in all creation. The human being has a body and a soul, which is the principle of consciousness. This consciousness has two levels. At the surface level, the human subject knows objects, performs actions and experiences pleasure and pain. Then there is the deeper level of consciousness, where the subject is simply the witness of the empirical self, unaffected by its pleasures and sufferings, by wants and needs, by motives and intentions. This deeper consciousness is the same as the divinity of the whole universe. This the predominant tradition in the *Ṛg Veda*, but there is a second tradition, which is found in one hymn of the tenth chapter (10.136). This is the tradition of the Munis, who are completely different from the members of mainstream society. Physically, the Munis have long hair, are dirty and wear yellow clothes. They are wanderers, not living in societies or performing any social function and not performing any sacrifices. The Munis claim that spiritual realization brings magical powers - a doctrine that is otherwise absent in the *Ṛg Veda*. According to Sāyana (after *c.*AD 780) the Munis 'become gods by the might of their penance'. This is also the first

time we find a reference to penance in the *Ṛg Veda*. The Munis have the power to transmit spiritual excellence and power to others: 'Exhilarated by the sanctity of the Munis, we have mounted upon the winds' (10.136.3). The plurality of gods and goddesses does not make any difference to the spiritual realization of the Muni, who is equally attached to all of them, 'the friend of each deity' (10.136.4). All persons also regard the Munis as their true friends, 'sweet and most delightful friends' (10.136.6).

2 The Pūrva-Mīmāṃsā conception

God is supposed to be known from the revealed scriptures (Vedas). Pūrva-Mīmāṃsā philosophers reject this theory. The revealed texts are only the source of knowing our duty, which is to perform sacrifices. There are names of gods and goddesses, but they do not have any reference beyond these names; there is no divinity beyond the names. There is nothing real beyond the texts. The revealed texts are eternal; they do not have any author. So God is not their author. The universe, too, is eternal and self-sustaining; God cannot, therefore, be postulated as the creator, sustainer and destroyer of the world. So gods and goddesses are just names that have magical powers to produce merit. When performing sacrifices one has to utter the sentences very carefully; as a result, one goes to heaven after death. Neither God-realization nor self-realization is the ultimate aim. In heaven, there are no gods or goddesses, for they are only names. To be in heaven is to enjoy bliss eternally; there can be no fall from heaven (see Mīmāṃsā).

3 The Vedānta conception

According to Śaōkara (*c.* AD 780), who propounded the Advaita Vedānta school of Indian philosophy, God-realization is not the ultimate aim of human life. God is one; he is the creator, sustainer and destroyer of the world, and is therefore omnipotent and omniscient, and the object of worship. But God is not the ultimate reality. For plurality, and therefore this world, are mere appearances (*māyā*), and God, as the creator of the world, is himself related to appearance. Ultimate reality (Brahman), on the other hand, is beyond all relations to objects, to humanity, to thought and to language. Ultimate reality is pure, impersonal, universal consciousness, devoid of any internal or external difference. This consciousness is identical with the self of the individual, which is different from other selves and material objects only at the surface level. At the deepest level, every person, as also every material object, is identical with Brahman. All reality is Brahman. One cannot worship Brahman, for worshipping presupposes a distinction between the subject and object of worship. Brahman is pure subject and can never become an object of worship or even of knowledge. One can only *be* Brahman, that is, realize that one is pure, impersonal, universal consciousness (see Brahman; Vedānta).

In the Vedānta system, God is conceived under two aspects: God pervades the world, and is also beyond it. God is both immanent and transcendent. The world of material objects and living beings contains a plurality of innumerable objects. The question which arises here is: how can the immanent unity be reconciled with the phenomenal plurality? The two major schools of Vedānta, the Advaita Vedānta of Śaōkara and the Viśiṣṭādvaita of Rāmānuja, answer this question differently. According to Śaōkara, manyness or plurality is inconsistent with unity, and as the inner reality is one, the surface reality, that is, the phenomenal world, is only apparent. This apparent world, the world-show, cannot be really related to the inner unity which is God. The relation between God and the world is like the relation between a piece of rope and the illusory snake for which it is mistaken. The piece of rope is, of course, necessary as the foundation of the illusory snake. So also God is the foundation of the illusory world. The cause of this illusory appearance is *māyā*, which has the dual function of covering reality and projecting illusory objects. The world projected by *māyā* is not real, but it is not wholly unreal. Thus the illusory object, the appearance, is neither real nor unreal. It is not real, for when one has spiritual illumination the world-show vanishes, just as, in good light, the illusory snake vanishes and the piece of rope is seen (see Error and illusion, Indian conceptions of §1). Nor is it wholly unreal, for a wholly unreal thing (such as a barren woman's son) cannot be perceived. The world is not unreal, for it is perceived to be real; the world is not real, for it is contradicted by spiritual realization of the universal unity. The bare identity of consciousness is the only reality; this consciousness is universal, impersonal, eternal. If the conception of God is necessarily that of a Person, then this universal consciousness cannot be called God; it is Brahman. So, according to Śaōkara, Brahman is not the creator of the world, for the world is not eternal, and whatever follows from Brahman must partake of its eternal reality. Brahman is the foundation of the world in the sense in which a real object is the foundation of an illusory object. There cannot be any illusion unless there is a real object which is mistaken for an illusory object. Thus illusion

differs from hallucination. Identity cannot tolerate any difference; so Brahman is pure identity devoid of all internal and external difference. Being aware of identity with Brahman, the illumination of the real self, is the ultimate aim of life.

Rāmānuja, on the other hand, argues that the empirical world of plurality cannot be illusory, for it is reality related to God, who is infinite. The world is, of course, not created by an antecedently existing God; God and the world are necessary for each other. Rāmānuja, in his Viśiṣṭādvaita philosophy, conceives the relation between God and the world on the analogy of the self and body of a human being. Just as a human being is an embodied consciousness, so also God is the self and the world is his body. The entire empirical universe is the body of God, who, as the indwelling spirit, is immanent in the universe. But even though both God and the world are real, still God as the soul of the world has supremacy over the world. Thus unity and plurality are both real; the ultimate reality - God - is unity in difference. To see God through self-surrender, not to be identical with him, is the ultimate aim of human life. Going to heaven cannot be the *summum bonum*, for one can stay in heaven only so long as one's merit is not exhausted. So there is necessarily a fall from heaven.

4 The Yoga conception

Patañjali, founder of the Yoga system, postulates God as a soul different from individual souls in that he does not have any blemishes and is eternally free. God is omniscient and omnipresent and is the creator of the world, which arises from ultimate matter (*prakṛti*) because of its association with individual souls due to nescience. All souls, individual as well as divine, are of the nature of consciousness not really affected by pain and suffering. The ultimate aim of life is not to realize God, but to realize the nature of one's own soul, which is wrongly believed to be associated with the body. But God-realization may help some individuals to attain self-realization. It is not compulsory to believe in God to attain the *summum bonum* of human life.

Patañjali did not feel the necessity of God for solving any theoretical problem of philosophy. For him, God has more a practical than a theoretical value. Devotion to God is considered to be of great practical value, inasmuch as it forms part of the practice of yoga and is one of the many means for the final attainment of concentration leading to yoga, defined as 'restraint of the mind'. The ultimate aim of human life is self-realization; God-realization is an optional means.

According to the Yoga system, God is the Supreme Person who is above all individual selves and free from all defects. He is the Perfect Being, eternal, all-pervading and omniscient. All individual selves are more or less subject to the afflictions (*kleśa*) of ignorance, egoism, desire, aversion and dread of death. They have to do various kinds of works (*karma*) - good, bad and indifferent - and reap the consequences (*vipāka*) thereof. They are also infected and influenced by the latent impressions of their past experiences (*āśaya*). Even if the liberated self is released from all these troubles, it cannot be said that it was always free from them. It is God and God alone who is eternally free from all defects. God is a perfect immortal spirit who remains ever untouched by afflictions and actions, and their effects and impressions. He possesses a perfect nature and also the fullest possible knowledge of all acts; he is, therefore, capable of maintaining the whole world by his mere wish or thought. He is the Supreme Ruler of the world and has infinite knowledge, unlimited power and the wisest desires, which distinguish him from all other selves.

5 The Nyāya conception

According to Nyāya, both old and new, God is a self-substance which has special qualities that distinguish God from individual selves. God as Supreme Self (*paramātman*) has eight qualities: number, magnitude, separateness, conjunction, disjunction, consciousness or knowledge, desire or will, and inner effort. God does not have pleasure, pain, aversion, memory traces, merit or demerit. This conception of God is fundamentally different from the Advaita Vedānta theory of Brahman, which identifies Brahman with existence, consciousness and bliss. The Nyāya conception of God, on the other hand, is of a substance which has existence, consciousness, will and inner effort, but not bliss, as special qualities. Moreover, God is one real object among many. There are several qualities that make God the Supreme Self. So far as omnipresence is concerned, God and individual selves have this quality in the same sense; both God and individual selves (or souls) are ubiquitous substances. It does not make sense to say that God is in the world or in humanity, or immanent in any sense. This is because ubiquitous substance cannot be in anything. On the other hand, all substances of finite magnitude are in contact with ubiquitous substances;

they are in these substances, but these substances are not in anything.

The difference between individual selves and God consists primarily in his not having any body. God is the Supreme Self without any body. The supremacy of the Supreme Self consists in his omniscience and omnipotence. But these qualities are conceived very differently in new Nyāya (Navya-Nyāya) than in other Indian philosophical systems. God's knowledge of all things and events, past, present and future, is one cognition and is eternal. Although God knows all objects, he does not know them in different cognitive states. He has only one cognition, which is eternally there. Moreover, this eternal knowledge can only be perceptual; it cannot be inferential, for any mediate cognition has to be produced by another cognition. But as God does not have a plurality of cognitions, and as his knowledge is eternal, his knowledge cannot be produced at all; for whatever is produced cannot be eternal.

The omnipotence of God is also conceived very differently in Navya-Nyāya than in other Indian philosophical systems. God creates everything through his will guided by his knowledge. Again, the will of God is one act of will and is eternal: God does not have to perform more than one act of will to create the world. Furthermore, God does not create everything that there is. According to Navya-Nyāya, there are eternal objects of various categories, such as the self, atoms, space, time, the mind (*manas*) and ether (*ākāśa*), all of which are substances. Also eternal are universals, the relation of inherence (*samavāya*) and the individuality (*viśeṣa*) that belongs to each eternal substance (see Nyāya-Vaiśeṣika §§4-5). These objects are all coeternal with God and cannot be created by him. Thus God's omnipresence and omnipotence are very much restricted in that he cannot be present in any ubiquitous substance such as space or time, nor in our souls. However, he does have unrestricted, eternal perception of all things past, present and future, as also of all eternal substances and objects.

Gödel, Kurt (1906-78)

The greatest logician of the twentieth century, Gödel is renowned for his advocacy of mathematical Platonism and for three fundamental theorems in logic: the completeness of first-order logic; the incompleteness of formalized arithmetic; and the consistency of the axiom of choice and the continuum hypothesis with the axioms of Zermelo-Fraenkel set theory.

A Sudeten German born in Brno, Moravia, Gödel received his doctorate in 1930 at the University of Vienna. His dissertation, extending earlier work by Skolem, demonstrated that first-order predicate calculus is semantically complete, that is, that every logical truth is provable. His incompleteness paper (1931, subsequently his *Habilitationsschrift*) showed that every ω-consistent recursively axiomatizable formalization of Peano arithmetic yields statements that are formally undecidable (neither provable nor refutable) within the theory. Rosser later showed that 'ω-consistent' could be weakened to 'consistent'. One of the undecidable sentences expresses the theory's own consistency. Hilbert's goal of reducing the consistency of arithmetic to that of weaker systems (see Hilbert's programme and formalism) thus cannot be realized.

While *Privatdozent* at the University of Vienna (1933-9) Gödel published several papers bearing on the decision problem (see Proof theory) and the relation between classical and intuitionistic logic (see Intuitionism). He also attended some meetings of the Vienna Circle, but disagreed with its philosophy (see Logical positivism).

Gödel spent the academic year 1933-4 at the Institute for Advanced Study in Princeton. Then, after recovering from an incapacitating bout of depression, he turned to set theory. In his address to the International Congress of Mathematicians in 1900, Hilbert had asked for a proof that every infinite set of real numbers is equinumerous either with the integers or the set of all reals (Cantor's continuum hypothesis). Gödel showed in 1938 that that assumption cannot be disproved within Zermelo-Fraenkel set theory, since it and the axiom of choice hold within a particular model thereof (see Set theory).

In 1940 Gödel emigrated to the United States. He returned to the Princeton Institute and remained there until his death from malnutrition - the result of further psychiatric disturbance - in 1978.

After 1942, frustrated by his failure to prove that the negation of the continuum hypothesis is also consistent with the axioms of set theory (a result finally established by Paul Cohen in 1963 - see Cohen 1966), Gödel worked primarily in philosophy and cosmology. Among the philosophical works published during his lifetime his commentary on 'Russell's Mathematical Logic' (1944) and his essay 'What is Cantor's Continuum Problem?' (1947, revised 1964) are notable for their mathematical Platonism. In the former, Gödel maintained that 'classes and concepts may…be conceived as real objects' whose existence is as tenable as that of physical bodies; in the latter that 'despite their remoteness from sense experience, we…have something like a perception also of the objects of set theory', whose 'axioms force themselves upon us as being true'. Posthumous philosophical works include a modal formalization of Leibniz's ontological proof.

Gödel's theorems

Utilizing the formalization of mathematics and logic found in Whitehead and Russell's Principia Mathematica (1910), Hilbert and Ackermann (1928) gave precise formulations of a variety of foundational and methodological problems, among them the so-called 'completeness problem' for formal axiomatic theories - the problem of whether all truths or laws pertaining to their subjects are provable within them. Applied to a proposed system for first-order quantificational logic, the completeness problem is the problem of whether all logically valid formulas are provable in it.

In his doctoral dissertation (1929), Gödel gave a positive solution to the completeness problem for a system of quantificational logic based on the work of Whitehead and Russell. This is the first of the three theorems that we here refer to as 'Gödel's theorems'.

The other two theorems arose from Gödel's continued investigation of the completeness problem for more comprehensive formal systems - including, especially, systems comprehensive enough to encompass all known methods of mathematical proof. Here, however, the question was not whether all logically valid formulas are provable (they are), but whether all formulas true in the intended interpretations of the systems are.

For this to be the case, the systems would have to prove either S or the denial of S for each sentence S of their languages. In his first incompleteness theorem, Gödel showed that the systems investigated were not complete in this sense. Indeed, there are even sentences of a simple arithmetic type that the systems can neither prove nor refute, provided they are consistent. So even the class of simple arithmetic truths is not formally axiomatizable.

The idea behind Gödel's proof is basically as follows. Let a given system T satisfy the following conditions: (1) it is powerful enough to prove of each sentence in its language that if it proves it, then it proves that it proves it, and (2) it is capable of proving of a certain sentence G (Gödel's self-referential sentence) that it is equivalent to 'G is not provable in T'. Under these conditions, T cannot prove G, so long as T is consistent. For suppose T proved G. By (1) it would also prove 'G is provable in T', and by (2) it would prove 'G is not provable in T'. Hence, T would be inconsistent.

Under slightly stronger conditions - specifically, (2) and (1′) every sentence of the form 'X is provable in T' that T proves is true - it can be shown that a consistent T cannot prove 'not G' either. For if 'not G' were provable in T it would follow by (2) that 'G is provable in T' would also be provable in T. But then by (1′) G would be provable. Hence, T would be inconsistent.

The proof of Gödel's second incompleteness theorem essentially involves formalizing in T a proof of a formula expressing the proposition that if T is consistent, then G. The second incompleteness theorem (that is, the claim that if T is consistent it cannot prove its own consistency) then follows from this and the first part of the proof of the first incompleteness theorem.

The two incompleteness theorems have been applied to a wide variety of concerns in philosophy. The best known of these are critical applications to Hilbert's programme and logicism in the philosophy of mathematics and to mechanism in the philosophy of mind.

1 Background

Interest in questions of completeness dates from quite early on in the history of logic and the foundations of mathematics. Aristotle (*Posterior Analytics* 87b) described the goal of science as the complete identification of the laws pertaining to its various areas. Much later, Kant expressed concern with completeness when he described human reason as inevitably disposed to pose questions to itself that it cannot answer. Clearer still, perhaps, are various statements in letters by Gauss (1817, 1829), in which he asserted that it may in principle be impossible for us to give a complete specification of the laws of geometry a priori owing to the fact that its object, space, is at least partially 'external' to our minds. (See Kronecker ([1887] 1932: 265) for an expression of the same view.) Finally, we find something approaching modern formulations of the notion in Hilbert ([1900] 1930: 242), where it is said to be a duty to show that a set of axioms for geometry capture every geometric law, and in Huntington (1905: 17), where a set of postulates for real algebra is said to form a 'complete' axiomatic basis for the subject.

However, it was not until the appearance of Hilbert and Ackermann's *Grundzüge der theoretischen Logik* (1928: 42-3) that the completeness problem received its first fully explicit, precise and general formulation. Hilbert and Ackermann believed that the formal-symbolic approach of modern mathematics had contributed greatly to its remarkable development, and they therefore advocated taking the same approach to logic. Such an approach would, they believed, pave the way for a mathematically precise study of both logical and mathematical thinking, and would make it possible to settle in a mathematical way various of the methodological and foundational questions pertaining to them. Among these was the question of 'completeness' - that is, whether the full class of truths or laws properly pertaining to a given domain of thought can be proved in a given system purporting to formalize it. Whitehead and Russell (1910) presented a formalism (PM) for logic and mathematics, and this became the focus of the early investigations of the completeness problem.

The first results were obtained (independently) by Bernays, in his unpublished *Habilitationsschrift* of 1918 (see Bernays 1926), and Post, in his doctoral dissertation of 1920 (see Post 1921). They isolated the propositional part of Whitehead and Russell's PM and showed that it proved all valid sentences of the propositional variety. Post indeed proved the stronger result (known as 'Post-completeness') that no sentence of the propositional variety can be added to PM without creating an inconsistency.

Hilbert and Ackermann observed that the broader logical system known as the 'restricted', or 'first-order' predicate calculus is not Post-complete (1928: 92). With this as his point of departure, Gödel, in his doctoral dissertation (1929), then took up the ordinary completeness problem for this system. Using ideas introduced by Löwenheim (1915) and Skolem (1923), he obtained the basic positive result that every valid formula of the first-order quantificational variety is provable in PM. Indeed, he proved the somewhat stronger result that every first-order quantificational formula is either refutable in PM or is satisfiable in a denumerable domain. He then extended the basic result to first-order logic with identity and the stronger result from single formulas to denumerable systems of formulas. In this latter extension, he made use of a 'compactness' result (namely, that a denumerably infinite set of formulas is satisfiable if and only if each of its finite subsets is) that he proved by semantic means.

In the introduction to his dissertation (deleted from the version published in 1930), Gödel expressed awareness of the possibility that the completeness problem for other areas of mathematical thought might not result in the same positive type of result as the completeness problem for PM. It was therefore not surprising that in 1930 he turned his attention to the completeness problem for the architectonic systems of Whitehead and Russell and Zermelo and Fraenkel (see Gödel 1930, 1931). These systems interested Gödel precisely because of their comprehensiveness. Such comprehensiveness might, he noted, lead some to conjecture that they can decide all mathematical questions formulable in their languages. What Gödel showed was that this is mistaken. There are problems - indeed, relatively elementary problems of the arithmetic of the integers - that even the most comprehensive systems cannot decide. Gödel's investigation of the completeness problem thus ended with a negative result.

There is a relationship between Gödel's 1929/1930 and 1931 studies that seems worth noting, even though he himself did not note it. It stems from the fact that every formal system is composed of both a logical and a non-logical part, deficiencies in either of which can lead to incompleteness. A defect of the first sort would mean that though the non-logical part might itself be perfect in content, the logical part would not be able fully to extract that content.

Gödel ([1929] 1930) can be seen as showing that incompleteness in systems whose logic is rightly taken to be first-order is due to deficiencies in the non-logical part, and his 1931 paper can then be seen as showing that such deficiencies extend to a wide range of systems. The latter also points to *logical* deficiencies in another class of systems, however - namely, systems whose non-logical parts are composed of the second-order Peano postulates and whose logical part is some formalizable scheme of second-order logical principles. This is a result of the categoricity of the second-order Peano postulates (first established in Dedekind 1888). Being categorical, they are in a certain sense perfect in their content. Still, Gödel (1931) establishes that any formal system based on them must be incomplete. Hence, any formalizable scheme of second-order logical consequence must fail to capture some of the content latent in them. In other words, any formal system of second-order logic must fail to capture some valid second-order logical principle. The 1931 paper can thus be seen as rounding out the logical investigations of the 1930 paper by providing a negative solution to the completeness problem for second-order

logic.

2 The completeness theorem

Gödel's original completeness proof was based on a normalization of quantificational formulas developed by Löwenheim (1915) and Skolem (1923). According to this normalization, there is an effective way of finding, for each formula ϕ of a first-order quantificational language L, a formula $\sigma(\phi)$ such that ϕ is satisfiable iff $\sigma(\phi)$ is, and $\sigma(\phi)$ is of the form $U–E–QF$, where *U* is a (non-empty) string of universal quantifiers, *E* a (possibly empty) string of existential quantifiers and *QF* a quantifier-free formula. Gödel showed how to construct conjunctions $K_n = QF_1 \,\&\ldots\&\, QF_n$ of instances QF_i of *QF* such that either for every *n*, K_n is truth-functionally satisfiable, or, for some *n*, K_n is not. Like Skolem, he then showed that if the first alternative holds, $\sigma(\phi)$ is satisfiable in the domain of the natural numbers. Finally, he was able to show - and this was his distinctive contribution - that if the second alternative holds, $\sigma(\phi)$ is refutable (that is, $\vdash_{\mathrm{PM}} \neg\sigma(\phi)$). With this came the crucial link between satisfiability and derivability in PM needed to prove PM's completeness.

It follows that $\sigma(\phi)$ is either denumerably satisfiable or refutable, and from this and the fact (also used by Gödel) that $\sigma(\phi)$ is refutable only if ϕ is, it then follows that for any formula ϕ of the language of the pure predicate calculus either ϕ is (denumerably) satisfiable or ϕ is refutable.

Gödel's proof was given for a specific logical calculus having a countable language (that is, a language containing countably many individual constants). Since then, completeness proofs have been devised both for a wider variety of calculi having countable languages (see, for example, Henkin 1949; Hasenjäger 1953; Hintikka 1955) as well as for calculi with uncountable languages (see Maltsev 1936). From this work, the following general method for constructing models for consistent sets of sentences of infinite cardinality has emerged.

To construct a model of infinite cardinality α for a consistent set S of sentences of language L of cardinality not exceeding α, one begins by adding α-many constants to L to form the language L^*. One then extends S to a maximal consistent and term-complete set S^*. (A consistent set is 'maximal consistent' iff no set properly containing it is consistent. A set is 'term-complete' just in case for every formula ϕ and all terms $t_1, \ldots, t_i, \ldots, t_\alpha$ of L^*, if $\phi(t_1), \ldots, \phi(t_i), \ldots, \phi(t_\alpha)$ are all elements of the set, then so is $\forall x\phi(x)$.) Next one constructs a model for S^* whose domain is the class of constants of L^*. And finally, one restricts this model to L and automatically obtains a model for S.

The proof that this construction yields a model *M* proceeds roughly as follows. (1) For every closed term *c* that appears in S^*, let *M* assign *c* itself as value. In this way, every element of the domain of *M* becomes the referent of a term of L^*. (2) For each basic *n*-ary predicate P^n of L^*, let *M* assign the *n*-tuple $\langle t_1, \ldots, t_n\rangle$ to the extension of P^n iff $P^n(t_1, \ldots, t_n)$ is an element of S^*. In this way, all atomic sentences and all denials of atomic sentences that are elements of S^* become true in *M*. This is so because S^*, being consistent, does not contain any atomic sentence that is denied by another element of S^*.

This completes the basis clause. In the induction step one calls upon the fact that, owing to its maximal consistency (and, in the case of quantified sentences, its term-completeness), S^* contains, for each of its compound elements σ_c (of complexity greater than that of the denial of an atomic sentence), a set of less complex elements whose joint truth suffices for the truth of σ_c. These less complex sentences fall under the hypothesis of the induction. The truth of the sentences of the basis clause thus 'induces' the truth of all elements of S^* of the next higher degree of complexity, and this process continues through all degrees of complexity. The truth-in-*M* of the sentences covered in the basis step thus eventually 'oozes up' to each element of S^*.

Every consistent set of sentences thus has a model. From this, both 'weak' completeness (every valid sentence is derivable) and 'strong' completeness (every sentence validly implied by a set of sentences is derivable from it) follow for systems admitting the usual types of derivations.

3 The first incompleteness theorem

Gödel made use of a formalization of mathematics in his 1931 paper that was related to that given in Whitehead and Russell (1910). But he added a new device - the 'arithmetization' of formal systems. This was based upon a division of the objects of a formal language into three basic categories: (1) the basic symbols of the language; (2)

finite sequences of these symbols; and (3) finite sequences of finite sequences of them. In order to express properties and propositions concerning these objects as predicates and sentences of arithmetic, Gödel defined a correlation (now called a 'Gödel-numbering') between the objects of these three types and the natural numbers. He coded the individual symbols of the systems by distinct odd numbers. To each finite sequence $\sigma_1, \ldots, \sigma_n$ of symbols he then assigned the number

$$2^{g(\sigma_1)} \cdot 3^{g(\sigma_2)} \cdot \ldots \cdot p_n^{g(\sigma_n)},$$

where p_n is the *n*th prime number and $g(\sigma_i)$ $(1 \leq i \leq n)$ the Gödel number of σ_i. Finally, to each finite sequence of finite sequences of symbols $\Sigma_1, \ldots, \Sigma_k$, he assigned the number

$$2^{g(\Sigma_1)} \cdot 3^{g(\Sigma_2)} \cdot \ldots \cdot p_k^{g(\Sigma_k)},$$

where p_k is the *k*th prime number and $g(\Sigma_i)$ $(1 \leq i \leq k)$ the Gödel number of Σ_i.

Infinitely many others schemes would be possible. The essential features are that distinct expressions are assigned distinct numbers and that there are effective procedures for encoding expressions and for decoding numbers to find which expression (if any) they represent.

Under such an encoding, certain formulas express not only arithmetic statements about numbers but also metamathematical statements about such objects as formulas, axioms and proofs. Using this observation, Gödel exploited an analogy with the Richard and liar paradoxes (see Paradoxes of set and property §6). (In passing he also observed that any other 'epistemological antinomy' could be put to similar use. See Gödel (1931: 598).) The analogy runs as follows.

Suppose that a theory *T* proves only true sentences and that a sentence *G* 'says' of itself that it is not provable in *T*. Neither *G* nor $\neg G$ is then provable in *T*. For if *G* is true then it is not provable in *T*, and if *G* is false then it cannot be provable because *T* proves only true sentences. So *G* is not provable in *T* and hence true. Its denial, $\neg G$, is thus false and hence unprovable in *T* since *T* proves only true sentences.

Gödel's proof follows this reasoning with one exception that he himself emphasized (1931: 599): it replaces the assumption that *T* proves only true sentences with the weaker assumption of ω-consistency (see below). The core of the proof is the construction of the 'self-referential' sentence *G* in the so-called 'diagonal lemma'. In its general form, this lemma states that for every formula F of L_T (that is, the language of *T*) of one free variable, there is a sentence D of L_T such that $\vdash_T D \leftrightarrow F(\ulcorner D \urcorner)$ (the term '$\ulcorner D \urcorner$' stands for the numeral of L_T whose referent under the standard interpretation of L_T is the Gödel number of *D*). We need only the following specialization of the diagonal lemma to *G*:

(DL) For every theory *T* that contains a certain fragment of arithmetic, there is a sentence *G* of L_T such that $\vdash_T G \leftrightarrow \neg\,\mathrm{Prov}_T(\ulcorner G \urcorner)$.

This lemma is also referred to as Gödel's 'fixed point theorem', *A* being a 'fixed point' in *T* of a formula $\phi(x)$ just in case $\vdash_T A \leftrightarrow \phi(\ulcorner A \urcorner)$. The formula $\mathrm{Prov}_T(x)$ 'expresses' the notion of a formula's being provable in *T* in the limited sense that the set of *A* such that $\vdash_T \mathrm{Prov}_T(\ulcorner A \urcorner)$ is the set of theorems of *T*. In the standard terminology, $\mathrm{Prov}_T(x)$ 'weakly represents' the set of Gödel numbers of theorems of *T* in *T*; that is

(WR) For every sentence *A* of L_T, $\vdash_T A$ iff $\vdash_T \mathrm{Prov}_T(\ulcorner A \urcorner)$.

From DL and WR, the proof of Gödel's first incompleteness theorem (G1) proceeds in two parts.

Part 1. If *T* is a consistent theory and $\mathrm{Prov}_T(x)$ satisfies both WR in the 'only if' direction and DL, then $\nvdash_T G$.

Proof. Suppose that

(1) $\vdash_T G$.

From this and WR in the 'only if' direction, we get

(2) $\vdash_T \mathrm{Prov}_T(\ulcorner G \urcorner)$.

But by (1), DL and the assumption that the logic of *T* allows *modus ponens* inference, we get

$\vdash_T \neg\mathrm{Prov}_T(\ulcorner G \urcorner)$,

which together with (2) implies the inconsistency of *T*.

Part 2. If *T* is consistent and $\mathrm{Prov}_T(x)$ satisfies both WR in the 'if' direction and DL, then $\nvdash_T \neg G$.

Proof. Suppose that

(3) $\vdash_T \neg G$.

From (3), DL and the fact that the logic of *T* allows both *modus tollens* inference and inference from $\neg\neg A$ to *A*, it follows that

$\vdash_T \mathrm{Prov}_T(\ulcorner G \urcorner)$.

But this and WR in the 'if' direction imply that

$\vdash_T G$,

which together with (3) implies the inconsistency of *T*.

Together, parts 1 and 2 establish

(G1) If *T* is consistent and $\mathrm{Prov}_T(x)$ satisfies DL and WR, then $\nvdash_T G$ and $\nvdash_T \neg G$.

It should be noted that WR in the 'if' direction is a different condition from that of the consistency of *T*. It forces all theorems of *T* of the form $\mathrm{Prov}_T(\ulcorner A \urcorner)$ to be true. Equivalently, given the decidability in *T* of the arithmetized proof relation of *T*, it forces *T* to be ω-consistent (that is, it forces *T* not to prove, for any formula ϕ, both all instances of $\phi(n)$ and also $\exists x \neg\phi(x)$). ω-consistency, which was explicitly used as a condition in Gödel's original proof, thus figures in our proof as well. Using a more complicated fixed point formula than *G* and a more complicated proof than the one just given, Rosser (1936) proved a version of G1 that does not require ω-consistency.

Parts 1 and 2 reveal the basic structure of the proof for G1. The details that remain are proofs of DL and WR. These can be found in many standard logic texts (for example, Enderton 1972; Boolos and Jeffrey 1974). Since Gödel's proof in 1931, a mathematically more interesting case of a purely combinatorial sentence undecidable in first-order Peano arithmetic (PA) has been given, in Paris and Harrington (1977). In the early 1980s, Friedman gave a still more striking case (involving Kruskal's theorem) of an arithmetical sentence undecidable in fragments of second-order Peano arithmetic considerably stronger than PA.

4 The second incompleteness theorem

Gödel arrived at the idea for his second incompleteness theorem (G2) by noting that, using the provability expression $\mathrm{Prov}_T(x)$ of part 1 of the proof of G1, one can define a consistency formula Con_T for *T* and that the proof of part 1 can then be carried out in *T*. In other words, one can prove '$\mathrm{Con}_T \rightarrow G$' in *T*. Together with part 1, this then implies the unprovability in *T* of Con_T.

The proof of '$\mathrm{Con}_T \rightarrow G$', however, requires conditions on $\mathrm{Prov}_T(x)$ that are different from those (namely DL and WR) required for the proof of G1. What exactly these conditions are becomes clear from the proof of '$\mathrm{Con}_T \rightarrow G$' given below.

The details of this proof require that we choose a specific definition of the consistency expression, Con_T. The definition we choose is the basic one, the formula '$\forall x(\mathrm{Prov}_T(x) \rightarrow \neg\mathrm{Prov}_T(\mathrm{neg}(x)))$' (where $\mathrm{neg}(x)$ stands for the function that sends the Gödel number of a formula to the Gödel number of its negation). We could define Con_T differently without altering the conditions on $\mathrm{Prov}_T(x)$ that are required for the proof of '$\mathrm{Con}_T \rightarrow G$' in *T*. The present definition, however, has the virtues of being both familiar and basic. We therefore proceed with the proof of

$\vdash_T \text{Con}_T \rightarrow G.$(G2 lemma)

Its core element is the construction of a derivation in *T* of $\neg\text{Con}_T$ from $\neg G$. We begin by stating five schemata whose provability in *T* will be assumed in the proof:

(a) $\text{Prov}_T(\ulcorner A \urcorner) \rightarrow \text{Prov}_T(\ulcorner \text{Prov}_T(\ulcorner A \urcorner) \urcorner)$
(b) $\text{Prov}_T(\ulcorner A \leftrightarrow B \urcorner) \rightarrow \text{Prov}_T(\ulcorner \neg B \leftrightarrow \neg A \urcorner)$
(c) $\text{Prov}_T(\ulcorner A \leftrightarrow B \urcorner) \rightarrow \text{Prov}_T(\ulcorner A \rightarrow B \urcorner)$
(d) $\text{Prov}_T(\ulcorner A \rightarrow B \urcorner) \rightarrow (\text{Prov}_T(\ulcorner A \urcorner) \rightarrow \text{Prov}_T(\ulcorner B \urcorner))$
(e) $\text{Prov}_T(\ulcorner A \urcorner) \rightarrow \text{Prov}_T(\ulcorner \neg\neg A \urcorner)$.

The proof proper begins by taking $\neg G$ as a hypothesis in *T*. We then reason in *T* as follows. Applying DL (whose content '$G \leftrightarrow \neg\text{Prov}_T(\ulcorner G \urcorner)$' is available in *T*), we get

(4) $\text{Prov}_T(\ulcorner G \urcorner)$.

From (4) and an instance of (a), we get

(5) $\text{Prov}_T(\ulcorner \text{Prov}_T(\ulcorner G \urcorner) \urcorner)$.

We now add a *T*-theoretic 'formalization' of DL; that is,

$\text{Prov}_T(\ulcorner G \leftrightarrow \neg\text{Prov}_T(\ulcorner G \urcorner) \urcorner)$.

This together with an instance of schema (b) gives

$\text{Prov}_T(\ulcorner \neg\neg\text{Prov}_T(\ulcorner G \urcorner) \leftrightarrow \neg G \urcorner)$,

which together with an instance of (c) then yields

$\text{Prov}_T(\ulcorner \neg\neg\text{Prov}_T(\ulcorner G \urcorner) \rightarrow \neg G \urcorner)$.

From this and an instance of (d) we get

$\text{Prov}_T(\ulcorner \neg\neg\text{Prov}_T(\ulcorner G \urcorner) \urcorner) \rightarrow \text{Prov}_T(\ulcorner \neg G \urcorner)$,

which with an instance of (e) gives us

$\text{Prov}_T(\ulcorner \text{Prov}_T(\ulcorner G \urcorner) \urcorner) \rightarrow \text{Prov}_T(\ulcorner \neg G \urcorner)$.

This and (5) via *modus ponens* in *T* imply

(6) $\text{Prov}_T(\ulcorner \neg G \urcorner)$.

(6) together with (4) then gives us

$\neg(\text{Prov}_T(\ulcorner G \urcorner) \rightarrow \neg\text{Prov}_T(\ulcorner \neg G \urcorner))$.

This and the definition of Con_T imply $\neg\text{Con}_T$. This is what was to be proved in *T* from our hypothesis $\neg G$. Discharging this hypothesis, we then get

$\neg G \rightarrow \neg\text{Con}_T$,

and from this, by contraposition in *T*, we conclude

$\text{Con}_T \rightarrow G$.

Inspecting this proof we see that it makes various common assumptions concerning the logic of *T*; for example, that it allows *modus ponens* inference, classical contraposition and universal instantiation. It also utilizes various conditions on $\text{Prov}_T(x)$ - specifically, schemata (a)-(e) and the 'formalized' version of DL. All of these, we will now show, can be obtained from the following 'derivability conditions'.

(DC1) For every sentence *A* of L_T, $\vdash_T A$ only if $\vdash_T \mathrm{Prov}_T(\ulcorner A \urcorner)$.
(DC2) For all formulas *A* and *B* of L_T,
$\vdash_T \mathrm{Prov}_T(\ulcorner A \to B \urcorner) \to (\mathrm{Prov}_T(\ulcorner A \urcorner) \to \mathrm{Prov}_T(\ulcorner B \urcorner))$.
(DC3) For every sentence *A* of L_T, $\vdash_T \mathrm{Prov}_T(\ulcorner A \urcorner) \to \mathrm{Prov}_T(\ulcorner \mathrm{Prov}_T(\ulcorner A \urcorner) \urcorner)$.

The sufficiency of DC1-3 can be seen as follows. Schema (a) is simply DC3 and schema (d) is DC2. The 'formalized' version of DL used above is obtained immediately by applying DC1 to DL. Schema (b) is obtained by applying DC1 to the logical truths of the form $(A \leftrightarrow B) \to (\neg B \leftrightarrow \neg A)$ to get the several instances of $\mathrm{Prov}_T(\ulcorner (A \leftrightarrow B) \to (\neg B \leftrightarrow \neg A) \urcorner)$, and then applying DC2. The remaining schemata are similarly obtained. Schema (c) is obtained by applying DC1 to the logical principle $(A \leftrightarrow B) \to (A \to B)$ to get $\mathrm{Prov}_T(\ulcorner (A \leftrightarrow B) \to (A \to B) \urcorner)$, which then, by DC2, yields (c). Schema (e) is obtained by application of DC1 to $A \to \neg\neg A$ to get $\mathrm{Prov}_T(\ulcorner A \to \neg\neg A \urcorner)$, and then application of DC2.

We thus arrive at the following generalized version of Gödel's second incompleteness theorem.

(G2) If *T* is consistent, Con_T is defined as $\forall x(\mathrm{Prov}_T(x) \to \neg \mathrm{Prov}_T(\mathrm{neg}(x)))$ and $\mathrm{Prov}_T(x)$ satisfies DC1-3, then $\nvdash_T \mathrm{Con}_T$.

5 The derivability conditions

DC1-3 represent a streamlining of the original 'Ableitbarkeitsforderungen' used in Hilbert and Bernays (1939: 285-6) to give the first full proof of G2. The improvements are due mainly to Löb (1955), though his aim was to identify a set of conditions on $\mathrm{Prov}_T(x)$ sufficient to solve a problem of Leon Henkin's and not to provide a general set of conditions under which G2 holds.

Jeroslow (1973) produced a further streamlining of the derivability conditions by showing how to eliminate DC2. The key idea was a new fixed-point or diagonalization construction - referred to as a 'literal' fixed point. It states that

For every formula $\psi(x)$ of L_T of one free variable, one can effectively find a formula ϕ and a closed term τ of L_T such that ϕ is $\psi(\tau)$, and $\vdash_T \tau = \ulcorner \phi \urcorner$.

What Jeroslow proved was a version of G2 lemma with a literal Gödel sentence G_{Lit} - that is, a sentence of the form $\neg \mathrm{Prov}_T(\tau)$, where $\vdash_T \tau = \ulcorner G_{\mathrm{Lit}} \urcorner$, and not merely a sentence provably equivalent in *T* to the sentence $\neg \mathrm{Prov}_T(\ulcorner G_{\mathrm{Lit}} \urcorner)$ - in place of the usual Gödel sentence *G*. His proof relies only upon the literal diagonal lemma, DC1 and DC3. Likewise, the relevant part of Jeroslow's version of G1 - namely, that if *T* is consistent, then $\nvdash_T G_{\mathrm{Lit}}$ - relies only upon the literal diagonal lemma and DC1. Together these two results yield a version of G2 that requires only the literal diagonal lemma, DC1 and DC3. We thus see that G2 can hold even when the formula expressing provability does not satisfy DC2. Among other things, this appears to distinguish G2 from Löb's theorem (that is, the theorem that for any sentence *A* of L_T and any formula $\mathrm{Prov}_T(x)$ satisfying DC1-3, if $\vdash_T \mathrm{Prov}_T(\ulcorner A \urcorner) \to A$, then $\vdash_T A$), since the known proofs of the latter demand satisfaction of DC2 (see Kreisel and Takeuti 1974: 7-8).

The approaches of Hilbert and Bernays (1939), Löb (1955) and Jeroslow (1973) are what might be called 'derivability conditions' approaches since they all rely for their application upon the satisfaction of some set of abstract conditions on $\mathrm{Prov}_T(x)$. Feferman (1957, 1960) has criticized such approaches on the ground that, for a given theory *T* and a given formula $\mathrm{Prov}_T(x)$ weakly representing the theorems of *T*, it is often difficult to determine whether or not such a set of conditions holds. He therefore sought a condition on provability expressions whose satisfaction or non-satisfaction is easier to determine, but which is still sufficient for G2.

By requiring that provability expressions preserve the logical and inductive structures of the usual definitions of formal provability, Feferman was able to reduce his condition to one governing the choice of expressions for the axioms of a system. That requirement is that the axiomhood formula be RE, where, roughly, this means that it preserves the way in which the axioms are 'presented'. An RE ('recursively enumerable') formula is one which transparently defines a recursively enumerable set of axioms. An RE formula representing an infinite set of axioms (which is the difficult case) imitates the inductive character of the metamathematical definition of that set (see

Smullyan 1961; Kreisel 1965; Feferman 1982, 1989). The advantage of using the RE criterion for G2 is that the RE representations form a primitive recursive set. Because of this, the question of whether a given expression of provability is RE is generally easier to answer than the question of whether it satisfies a given set of derivability conditions.

Using his new condition, Feferman proved the following version of G2 (1960: theorem 5.6).

If *T* is a system containing a minimal amount of arithmetic, $Ax_T(x)$ is an RE formula representing the axioms of *T* in *T*, and Con_T is built up from $Ax_T(x)$ in a way that corresponds to any of the usual ways in which the definition of consistency is related to the definition of axiomhood for *T*, then $\nvdash_T \mathrm{Con}_T$.

He also showed (theorem 5.9) that the restriction to RE cases of $Ax_T(x)$ is important since there are theories *S* and non-RE representations of their axioms $Ax^*_S(x)$ such that consistency formulas Con^*S - built up from $Ax^*_S(x)$ in exactly the same way that Con_T is built up from $Ax_T(x)$ - *are* provable in *S*. See Feferman (1982, 1989) for further development of his search for a general, readily applicable characterization of the representations of metamathematical notions with respect to which G2 holds.

Derivability conditions approaches have generally been enhanced by the recent development of provability logics (see Provability logic). The choice between the two types of approaches is complicated by the fact that Jeroslow’s criterion for G2 appears to apply to theories to which Feferman’s does not (namely, various cut-free systems of analysis - see Kreisel and Takeuti 1974). Thus, though Feferman’s G2 criterion may generally be easier to apply than those of the derivability conditions approaches, it does not appear to be as broad in scope (see Feferman’s remark 1 in Gödel (1990: 282-7) for a related discussion).

6 Philosophical applications

There have been many attempts to apply Gödel’s incompleteness theorems to philosophical concerns. For the most part, these have to do with issues in the philosophy of mathematics and the philosophy of mind, though there have also been attempts in other areas of philosophy, and also in areas of intellectual life not lying wholly within philosophy (see Thomas 1995). Here we consider some of the better-known and/or better-developed applications.

In the philosophy of mathematics the chief application is to Hilbert’s programme which is widely believed to have been refuted by G2. This is so because G2 is seen as prohibiting the finitary consistency proof that Hilbert demanded for classical mathematics (see, for example, Gödel 1958; Kitcher 1976; Kreisel 1958; Prawitz 1981; Resnik 1974; Smorynski 1977, 1985; Simpson 1988; for a dissenting view see Detlefsen 1986, 1990). G1 has been presented as having a similar effect through its exhibition of a recognizedly true real sentence of classical mathematics (namely, *G*) that is not finitarily provable (see Smorynski 1977, 1985; Hilbert’s programme and formalism §4).

Gödel’s theorems have also been used to argue against logicism. One example of this is in Hellman (1981), which maintains that G2 implies that no finitely axiomatizable logicist system exists. For non-finitely axiomatizable systems, the claim is weaker: such systems may exist, but G2 prohibits our being able to know of any particular system that it is one of them. A major attraction of Hellman’s argument is that, unlike other arguments against logicism, it does not require that one know where to draw the line between logic and non-logic.

Gödel’s theorems have also figured in philosophical discussions concerning the nature of proof. Among the more interesting of these are Myhill (1960) and Reinhardt (1985, 1986). Myhill argues that G1 and G2 establish that for any correct system containing arithmetic there are ‘correct’ inferences - inferences to whose acceptability the user of the system is rationally committed - that cannot be captured in it. There is thus, he says, an absolute epistemic notion of provability (neither syntactic, nor semantic nor psychological in character), according to which Gödel’s undecidable sentences are provable. Hence, this notion of absolute provability is not formalizable. Reinhardt (1985, 1986) refines aspects of this argument and also argues that if ‘humanly provable’ means ‘formally provable’ there must be absolutely undecidable sentences of arithmetic. He urges the view that G2 is an epistemic phenomenon - one that arises from the epistemic properties of that type of belief that mathematical proof is supposed to sponsor. These properties, it turns out, lead to something tantamount to the derivability conditions.

In a related vein, Dummett (1963) has used G1 to argue that mathematical proof (including that which lies within a

well-circumscribed subject area) is an 'indefinitely extensible concept' and cannot therefore be identified with derivation in any formal system. Since, he believes, the meanings of mathematical statements are to be given in terms of a concept of proof, this means that the notion of proof that determines the meanings of mathematical statements must be an essentially vague and unformalizable one. In this he sounds a theme similar in certain respects to one associated with the intuitionist, Brouwer.

Chaitin (1974, 1975, 1982) offers an analysis of Gödel's theorems that links them to limits on the extent to which information in a given mathematical field can be 'compressed' into a formal system. They thus, according to Chaitin, point up the need for a continuing search for new axioms (see Computability and information). This view of the relationship between Gödel's theorems and algorithmic information theory is challenged in van Lambalgem (1989).

In the philosophy of mind and metaphysics, the main application of the theorems is to the question of mechanism ('Do human-like minds have only such capabilities as are simulable by computational devices?' - see Mind, computational theories of §5) and, more generally, to the question of materialism ('Are all objects, events and/or forces in the world reducible to physical matter and its physical properties?' - see Materialism; Materialism in the philosophy of mind). Gödel himself (1951) presented such an application, arguing that either the mind of the human mathematician cannot be codified by any formal system or that there exist absolutely unsolvable arithmetical problems of an elementary sort. On the former alternative, supposing Church's thesis, mechanism clearly fails. On the latter, Gödel argued, materialism fails. For if there are mathematical problems that are absolutely unsolvable, then mathematics is not our own creation; and if this is so, its objects must exist independently of us, in which case a materialist view of reality fails. See Wang (1993) for a useful discussion of Gödel's argument.

The most well-known anti-mechanist argument is that of Lucas (1961), modified by Benacerraf (1967) and repeated in Penrose (1989, 1994). In outline, the argument is as follows. (1) If human minds were mechanizable (or, in some versions, if they could be known to be identical to some particular machine), then, by G2, they could not know that their beliefs are consistent. But (2) human minds can know that their beliefs are consistent; therefore, (3) they are not mechanizable (or, as in Benacerraf's variant, they cannot be known to be identical to any particular machine).

Lucas' argument has been widely criticized (see, for example, Boolos 1968; Chihara 1972; Dennett 1978; Putnam 1960 (before the fact); Smart 1961; Wang 1974; Webb 1968, 1980). Its chief difficulty is perhaps one that is partially concealed by the unclarity of premise (2). It is true that humans are capable of examining various of their sets of beliefs and arriving at credible judgments regarding their consistency. It does not follow from this, however, that among the sets of beliefs they can judge to be consistent are some that contain that very consistency judgment itself. Indeed, if fixing a set of beliefs is a typical precondition for its evaluation, it would seem that consistency judgments do not typically belong to the sets to which they are applied; for at the time the beliefs are fixed such judgments would not yet have been made and so would not exist as elements of the set being evaluated. For consistency evaluations not requiring such prior fixing of beliefs, on the other hand, it is not clear that G2 applies. Either way, Lucas-type arguments face serious difficulties (see Detlefsen 1995).

Godfrey of Fontaines (*c*.1250-*c*.1306/9)

Godfrey of Fontaines studied philosophy and theology at the University of Paris and subsequently taught theology there. A theologian by profession, he developed a highly interesting philosophy, especially a metaphysics. For Godfrey, metaphysics studies being as being. Being itself is divided into cognitive being and real being, and real being is divided into being in act and being in potency. In finite beings, essence and existence are neither really distinct nor intentionally distinct; they are identical. Human reason can prove that God exists, and reach some imperfect knowledge concerning what God is, but cannot prove that the world began to be. For Godfrey, corporeal entities in this world are composed of matter and form, but heavenly bodies probably lack prime matter. On philosophical grounds, he favours the theory that there is only one substantial form in human beings - the intellective soul - but for theological reasons leaves this question open. His philosophy is somewhat more Aristotelian and less Neoplatonic than that of most of his contemporaries.

1 Life and works

Born in the principality of Liège in modern Belgium, probably shortly before 1250, Godfrey of Fontaines studied philosophy at the Faculty of Arts of the University of Paris, presumably before 1274, and then completed the lengthy programme in the theology faculty, eventually becoming regent master in theology in 1285. He continued to teach theology at Paris until about 1298-9, and then returned to the same position around 1303-4. He died around 1306, or perhaps in 1309.

His major contributions to philosophical and theological literature were his fifteen *Quodlibeta (Quodlibetal Questions)*. These originated from public disputations which were open to anyone who might wish to pose questions about any reasonable topic, and which were again disputed and 'determined' (resolved) by the presiding master on some following day. Godfrey also conducted other 'ordinary' disputations, and some of these have been preserved. His philosophy, especially his metaphysics, is highly interesting, and he often turned to it in deciding theological issues.

2 Theory of being

With Aristotle, Godfrey holds that metaphysics has being as being as its subject. Being is the most general notion the human mind can discover, and is affirmed primarily of substance and of everything else as in some way ordered to substance. Godfrey divides being into cognitive being (being in the mind of a knower, whether human or divine), and real being (being outside the mind). Real being is divided into being in potency and being in act. For a thing to have being in potency is for it to exist in one or more causes which have the capacity to bring it into actual being. A thing may have potential being by reason of an intrinsic cause, for example, pre-existing matter which would enter into that thing's structure when it receives actual being, or by reason of an extrinsic cause (or causes) which can bring it into actual being. For a thing to have actual being is for it to exist in its own right with its own complete form or nature (see Being).

3 Theory of essence and existence

Much debated during Godfrey's time was how essence is related to existence in created entities. It was generally conceded that they are identical in God. Godfrey strongly rejects the view that essence and existence are really distinct in creatures. He directs special attention to the way this theory was defended by Giles of Rome, who had referred on some occasions to this as a distinction between two 'things'. However, Godfrey also rejects, at least by implication, the more nuanced distinction of essence and act of being (*esse*) defended by Thomas Aquinas. He also rejects Henry of Ghent's claim that they are intentionally distinct, that is, by a distinction that is less than real but more than purely mental (see Henry of Ghent). For Godfrey, essence and existence are really identical, so strictly so that whatever is true of one is true of the other, and whatever is known of one is known of the other. He denies (against Thomas and Giles, but also against Henry) that one can know what something is (its essence) without knowing that it is (its existence). He tries to account for our awareness of nonexistent possible entities simply by appealing to the distinction between our knowing something as only potentially existing and our knowing it as actually existing. Neither real nor intentional distinction of essence and existence is needed to account for this (see Existence).

To account for the non-simple character of created entities, especially purely spiritual entities such as angels, Godfrey maintains that such beings fall short of God, the supreme or first ‘One’, by possessing an intermediary nature. In comparison with God they may be regarded as potential, but in comparison with less perfect created beings they may be regarded as actual. This is enough for him to defend their act-potency ‘composition’ and thereby distinguish them from God. This solution blends Aristotelianism (act-potency composition) and Neoplatonism (Proclus’ notion that what participates in the ‘One’ or God, is both one and not one) (see Aristotelianism, medieval; Platonism, medieval).

4 Philosophical knowledge of God

Godfrey accepts the prevailing view of his time that in this life human beings do not enjoy direct or intuitive knowledge of God. In addition to the knowledge of God afforded believers by divine revelation, Godfrey defends the human mind’s ability to reason from knowledge of effects to knowledge of God as their first cause. He assigns some role in this process to argumentation based on motion which concludes to a First Mover in accord with Aristotle’s procedure in the *Physics*, but reserves more precise knowledge of God to metaphysics.

Godfrey does not fully accept Aquinas’s view that by reasoning philosophically we can know that God is and what God is not (with which Godfrey agrees) but not what God is. Godfrey maintains that through appropriate metaphysical reasoning we can also know something about what God is, though such knowledge will always be incomplete and imperfect. In discussing God’s knowledge and production of created entities, Godfrey appeals to a theory of divine ideas. For him these are simply different ways in which God understands his essence as capable of being imitated by creatures. The divine ideas are not really distinct either from one another or from the divine essence. Even so, Godfrey does postulate a plurality of divine ideas to correspond to different specific classes of creatures but, against the prevailing view of his time and in agreement with Henry of Ghent, he denies that divine ideas are multiplied to correspond to different individuals within species (see God, concepts of).

5 Eternal creation

Sharply contested during Godfrey’s time was the issue concerning whether or not philosophical argumentation can demonstrate that the world began to be. All participants in this discussion acknowledged that, on the strength of Scripture, we can be certain that the world began to be, but some, such as Henry of Ghent, maintained that human argumentation can demonstrate this conclusion. Others, including Thomas Aquinas, Siger of Brabant and Boethius of Dacia denied that human reason can prove this. In addition some, including Aquinas near the end of his career in his *De aeternitate mundi (On the Eternity of the World)*, went so far as to maintain that human reason can establish the possibility of an eternally created world. Godfrey holds that human reason cannot prove that the world began to be, but, while he is heavily dependent on Aquinas’ *De aeternitate mundi*, he refuses to go so far as to claim that human reason can prove that an eternally created world is possible (see Eternity of the world, medieval views of).

6 Substance and accidents

Godfrey accepts the usual Aristotelian distinction between substance and accidents, but rigidly applies the equally Aristotelian theory of act and potency to their relationship. If accidents inhere in their appropriate substances as secondary actualities in an underlying potential subject, can a substance efficiently cause any of the accidents that inhere in it? For Godfrey this is impossible, for it would mean that a substance would be active (as efficiently causing its accidents) and passive (as receiving them) at one and the same time with respect to the same thing. He is especially critical of Henry of Ghent’s claim that a substance may be regarded as the proximate efficient cause of its proper accidents and operations. One particular point of disagreement had to do with the causal explanation of human activities, especially volition. In such cases Henry maintains that a human agent, because of the spiritual nature of the will, can reduce itself from what he calls virtual act to formal act, and that this happens in acts of choice (see Henry of Ghent). For Godfrey this would violate the Aristotelian view that whatever is moved is moved by something else and that nothing can reduce itself from potency to act. The human will is not the efficient cause of its acts of choice since they inhere in the will itself: their efficient cause is rather the object of choice insofar as this is presented to the will by the intellect. Not surprisingly, Godfrey’s highly intellectualist account of human choice was criticized by some as leading to determinism. Closely connected with Godfrey’s position concerning this is his defence of a real distinction between the soul and its powers, including the intellect and the

will.

7 Matter and form

Godfrey accepts the Aristotelian view that corporeal entities are composed of prime matter and substantial form, and that they unite as potency and act to constitute the essence of such entities. He strongly insists that prime matter is pure potency, and denies, especially against Henry of Ghent, that it enjoys some minimum degree of actuality in itself that would be sufficient for God to keep it in existence without any form. In arguing for the matter-form composition of material entities to account for the change of one material substance into another, Godfrey is ultimately inspired by Aristotle's procedure in *Physics* I. Against the view defended by some thirteenth-century thinkers, Godfrey rejects any kind of matter-form composition of purely spiritual entities such as human souls and angels. He also rejects the view proposed by some, such as Aquinas, that because of their incorruptible character, heavenly bodies are composed of a special kind of prime matter and their appropriate substantial forms. Because he also accepts the prevailing view that heavenly bodies are not subject to corruption, Godfrey is forced into a difficult position. Drawing upon Averroes, he proposes that it is better to say that there is no matter in the proper sense in the heavenly bodies; for if there were, they would be subject to corruption (see Ibn Rushd). Godfrey refers to this position as being 'more probable'.

Closely related to Godfrey's views on matter and form is his consideration of another contested issue: unity versus plurality of substantial forms in corporeal substances, especially in human beings. Aquinas had argued that in human beings the intellective soul is their single substantial form, but his position had been condemned after his death by two Archbishops of Canterbury, Robert Kilwardby in 1277 and John Pecham in 1284 and 1286. Godfrey's philosophical argumentation leads him to favour unicity of substantial form in all corporeal entities, including human beings. However, theological concerns, especially the need to explain how the body of Christ could continue to retain its identity as his body during the three days in the tomb, perplex him. Hence, while he insists upon the theologian's right to defend unicity of substantial form, Godfrey styles this theory as more probable but does not adopt it definitively.

Godfrey devotes considerable effort to determining the respective roles of form, prime matter, and quantity in the individuation of material entities. He concludes that a thing's substantial form is its formal principle of individuation, and that quantity plays the role of material dispositive cause by rendering matter divisible into numerically distinct parts which can therefore receive different substantial forms of the same kind. His philosophy is somewhat more Aristotelian and somewhat less Neoplatonic than that of most of his contemporaries.

Godwin, William (1756-1836)

William Godwin is considered the founder of philosophical anarchism. His An Enquiry Concerning Political Justice (1793) contends that although government is a corrupt force in society, perpetuating dependence and ignorance, it will increasingly be rendered impotent by the gradual spread of knowledge. Politics will be displaced by an enlarged morality as truth conquers error and mind subordinates matter. He predicts the end to cooperative activities (which restrain individual freedom), the abandonment of marriage and private property, and increasing longevity and ultimate immortality.

Godwin's moral theory is often described as utilitarian, but he understands pleasure to be inseparable from the development of truth and wisdom through the full and free exercise of private judgment and public discussion. As such, his position is better understood as perfectionist.

1 Life

William Godwin was born 3 March 1756, the son of a Dissenting minister, and was educated for the ministry at the Hoxton Dissenting Academy. When his vocation failed he turned to political journalism. Caught up in the wave of enthusiasm which greeted the French Revolution in 1789, he took an active interest in the controversy which followed Edmund Burke's attack (see Burke, E.) on the revolutionaries and their English supporters (notably Richard Price and the Dissent-dominated London Revolution Society). Godwin's *Enquiry Concerning Political Justice*, written between September 1791 and January 1793, was intended as a summary of recent developments in moral and political philosophy. It begins with evident debts to the *philosophes* (especially Baron d'Holbach, Claude-Adrien Helvetius and Jean-Jacques Rousseau), to Thomas Paine's *Common Sense* (1775) and *Rights of Man* (1791-2; see Paine, T.) and to Price's Platonism. But as the work develops, Godwin's own position emerges, the *philosophe* influence is displaced by a secular interpretation of several central themes of rational dissent: notably the importance of candour, the doctrine of philosophical necessity, the irresistible power of truth, and the sanctity of private judgment. From these materials Godwin forges a resounding attack on contemporary political institutions and a philosophical anarchism which rejects all government interference.

Political Justice brought Godwin widespread renown, which *Caleb Williams* (1794), his most successful novel, confirmed. By the end of the decade, however, he had fallen victim to the loyalist reaction - a fate he partly invited by his frank memoir of his deceased wife, Mary Wollstonecraft (1798). While he continued to write until his death, he never regained his reputation.

2 Ethics

Godwin's moral position as expressed in *Political Justice* is complex because he endorses two potentially conflicting moral principles. In the chapter 'Of Justice' (II.2), he uses his most famous moral example, 'The Famous Fire Cause'. He argues that when faced with a situation in which I can save either Fenelon (see Fenelon, F.), the illustrious Archbishop of Cambrai, or his chambermaid, I should save Fenelon, even if the chambermaid is my mother. This is justified not on grounds of desert, but because of the benefit which Fenelon will confer on humankind. This argument encapsulates Godwin's more general claim that we should act to maximize utility, motivated wholly by disinterested benevolence, and unaffected by familial or other attachments.

Godwin's argument involves a most demanding conception of personal rectitude (albeit softened by changes in later editions of *Political Justice* and elsewhere). His position rests on three elements: that we can all come to recognize the same or similar moral or ethical principles upon which to base our conduct; that we will act on the basis of these principles without incentives from self-interest or coercion; and that we will order every aspect of our lives, public and private, in accordance with these principles. The first premise derives from Godwin's background in rational dissent, coupled with a more general enlightenment optimism, which assumed convergence in matters of belief. The second rests on an understanding of necessitarianism derived initially from David Hartley, Jonathan Edwards and Joseph Priestley, which held that when feeling contends with moral truth the understanding experiences this as a contention of ideas, and will resolve in favour of the more general and powerful (a view also indebted to Price's Platonism). The third has its origins both in Godwin's classical reading, with its ideal of the virtuous citizen, and in his theological training, in which subordination to God is equally demanding of public and

private life.

Godwin's endorsement of the utility principle is qualified by two arguments: that the happiness of another can best be promoted indirectly, by enlightening the understanding; and that pleasures differ qualitatively, with wisdom and benevolence affording infinitely superior pleasure to sensual gratification. His utilitarianism is, then, indirect and ideal (see Utilitarianism).

Godwin's second basic moral principle is the right of private judgment. Morality requires that we act wholly upon the dictates of the understanding. We have a duty to justice, but our only route to justice is through the full and free exercise of private judgment. Private judgment is best seen as a right for Godwin, despite his rejection (most forcefully in the first edition of *Political Justice*) of the language of rights. It is not reducible to utility because its exercise is both an indefeasible duty and the highest form of existence we can attain. Clearly, there is utility to be gained from respecting private judgment, but we cannot abrogate an individual's judgment for the sake of utility - not least because there is no infallible standard for what utility demands. This suggests that Godwin's position is best characterized as perfectionist: the true end of moral action is the progressive improvement of our moral and intellectual faculties.

Godwin's position is distinctive because he combines an act-centred conception of moral duty - act so as to maximize overall benefit - with an agent-centred, perfectionist conception of moral agency and virtue - according to which action is only fully moral when intention and outcome are brought together in a fully rational will. Neither government nor individuals may legitimately transgress another's private judgment. We have a right to remonstrate with them, but we have a duty to respect their considered judgment. Behind this account lies a deeper theory, driven by the doctrine of necessity and by the belief that mind is potentially sovereign over desire and feeling, which sees the apex of human perfection as a life lived in the light of truth. It is not difficult to recognize here the residual effect of Godwin's Dissenting inheritance.

Godwin's philosophical position underwent a number of changes at the end of the 1790s and after: his rationalism ebbed, and he endorsed a sentiment-based theory of moral judgment and moral motivation. Yet, even while making the changes, Godwin insisted that they did not touch the central tenets of his position. This is not an easy claim to assess. The later editions of *Political Justice* (1796, 1798) advance a more tepid doctrine of progress than the first. In *The Enquirer: Reflections on Education, Manners and Literature* (1797) sympathy is clearly rehabilitated, as is feeling more generally. It is also possible to identify a more nuanced doctrine of moral motivation, in which the love of fame or distinction is accorded a more positive role than in *Political Justice*. The emphasis on stimulating the imagination, rather than on reason, and the suggestion that the imagination is the basis for moral sense can be recognized in both *The Enquirer* and the later *Letter of Advice* (1818). Moreover, *Thoughts on Man* (1831) contains arguments which seem wholly at odds with his earlier egalitarianism.

3 Anarchism and liberalism

There is, nonetheless, a consistent core to Godwin's work. His philosophical speculations are best understood as speculations, not foundations. What is foundational is his basic conviction that private judgment and public discussion are the essential means to the development of moral and political truth, and that we become fully human only by coming to live wholly in accord with the dictates of the understanding. To do less is to be less - less rational, less individual, less worthy and less human. Godwin's novels, and much of his other writing, explore how we come to be less than we might be; and it is in these accounts, and in the swingeing attack on monarchical and aristocratic regimes in *Political Justice*, that he takes to task the world of aristocratic power and privilege in which he lived. His religious writings perform much the same role with respect to the other central institution of imposture and fraud, the Christian Church. Indeed, the separation of his works into disciplinary categories misses the point that in nearly everything he wrote Godwin was concerned to further the moral and intellectual development of his fellow men and women, and to reveal to them the extent to which they have been misled and imposed upon by the political, social and religious institutions of their society.

Political Justice remains Godwin's most forceful expression of this position. Despite its eccentricities and occasional extremism, it is a work of considerable philosophical originality and power. Sixty years before John Stuart Mill's *On Liberty* (1859), Godwin synthesized an indirect and ideal utilitarianism with a conception of individual wellbeing and a rights-based doctrine of private judgment, which is in many respects more compelling

than Mill’s. Moreover, where Mill hedges liberty against the masses, Godwin shares the eighteenth-century view that the greatest threat is from government. His anarchism simply takes this distrust to its ultimate conclusion. Liberals have tended to dismiss Godwin as an extremist and utopian, yet by combining his commitment to utility as a principle of justice with an equal commitment to private judgment as an indefeasible adjunct principle of right, he offers us a radical vision set within impeccably liberal constraints.

Goethe, Johann Wolfgang von (1749-1832)

*Goethe was a statesman, scientist, amateur artist, theatrical impresario, dramatist, novelist and Germany's supreme lyric poet; indeed he provided the Romantic generation which followed him with their conception of what a poet should be. His works, diaries and about 12,000 letters run to nearly 150 volumes. His drama Faust (1790-1832) is the greatest long poem in modern European literature and made the legend of Dr Faust a modern myth. He knew most of the significant figures in the philosophical movement of German Idealism (though he never met Kant), but he was not himself a philosopher. His literary works certainly addressed contemporary philosophical concerns: Iphigenie auf Tauris (Iphigenia in Tauris) (1779-86) seems a prophetic dramatization of the ethical and religious autonomy Kant was to proclaim from 1785; in his novel Die Wahlverwandtschaften (The Elective Affinities) (1809) a mysterious natural or supernatural world of chemistry, magnetism or Fate, such as '*Naturphilosophie*' envisaged, seems to underlie and perhaps determine a human story of spiritual adultery; in Faust, particularly Part Two, the tale of a pact or wager with the Devil seems to develop into a survey of world cultural history, which has been held to have overtones of Schelling,Hegel or even Marx. But whatever their conceptual materials, Goethe's literary works require literary rather than philosophical analysis. There are, however, certain discrete concepts prominent in his scientific work, or in the expressions of his 'wisdom' - maxims, essays, autobiographies, letters and conversations - with which Goethe's name is particularly associated and which are capable of being separately discussed. Notable among these are: Nature and metamorphosis (*Bildung*), polarity and 'intensification' (*Steigerung*), the 'primal phenomena' (*Urphänomene*), 'the daemonic' (*das Dämonische*) and renunciation (*Entsagung*).*

1 Life and works

Johann Wolfgang Goethe was born on 28 August 1749 in Frankfurt am Main, then a self-governing free city within the Holy Roman Empire. His father lived off his capital and his mother was the daughter of the city's principal official. He studied law in Leipzig, where he met J.C. Gottsched, the literary reformer and interpreter of Leibniz, and then in Strasbourg, where he met J.G. Herder, who opened his eyes to the merits of folk poetry andShakespeare. Goethe's first great literary success was the Sentimentalist novel in letters, *Die Leiden des jungen Werthers (The Sorrows of Young Werther)* (1774). Its story of a young intellectual who falls in love with a married woman and commits suicide made him a European celebrity. The mid-1770s were a period of great fertility for Goethe, and in about 1773 he began *Faust*, the work which was to occupy him throughout the rest of his life. In 1775 he accepted an invitation from the young Duke of Weimar, a sovereign prince, to visit his court and then to become a Privy Councillor of the duchy. Goethe did not return to Frankfurt and remained permanently in the Weimar administration. At first he had a heavy load of official work and his responsibility for the (unproductive) Weimar silver mines led him to an interest in geology and other branches of natural history. In 1782 he was ennobled, becoming 'von Goethe', but his literary powers seemed to be languishing. However, after he had spent a sabbatical period from 1786-8 in Italy (where he met the aesthetician K.P. Moritz), the Duke allowed him to concentrate on writing and on managing the Weimar theatre. A fragmentary version of *Faust* was published in the first authorized edition of his collected writings (1787-90), which also contained some other noteworthy plays, such as *Iphigenie auf Tauris (Iphigenia in Tauris)*, *Egmont* and *Torquato Tasso* (believed to be the first tragedy with a poet as its hero), and the first collection of his lyric poems. In 1790 he published a brief general theory of botany, *Versuch, die Metamorphose der Pflanzen zu erklären (Essay in Elucidation of the Metamorphosis of Plants)*.

Already in 1776 Goethe had arranged for Herder to come to Weimar as the head of the Lutheran Church in the duchy, and in 1789 he recommended Friedrich Schiller for a chair in history at the local university of Jena. After his return from Italy, Goethe became increasingly involved in the affairs of the university, paying particular attention to the appointments in the natural sciences and in philosophy, where he followed a policy of encouraging young talent and especially the new Kantian school (already established in Jena by Reinhold). He had some part in the successive appointments of Fichte, Schelling and Hegel, and after he had established a close friendship in 1794 with Schiller, who was just completing the major aesthetic essays of his Kantian period and with whom he undertook various joint editorial ventures, Goethe spent as much time in the university world of Jena and in the circle of Romantic writers centred on F. Schlegel as in the court world of Weimar. During this period he published

a long novel, *Wilhelm Meisters Lehrjahre (Wilhelm Meister's Years of Apprenticeship)*, which had been in the making for twenty years, and his interests in natural history were displaced by a passion for the theory of colour, of which he had become convinced Newtonian optics gave a perversely false account (see Colour and qualia). His reactions to the French Revolution, which threatened to overturn the world he had grown up in, were expressed in the play *Die Natürliche Tochter (The Natural Daughter)* (1803). From 1799 Schiller's mature plays provided the Weimar theatre with the centrepiece of a programme for raising theatrical and literary standards throughout Germany, but the German Romantic movement was already well under way and Goethe's Italianate and Hellenizing tastes already seemed old-fashioned. In 1805 Schiller died, and the following year Napoleon put an end to the old German order and the Holy Roman Empire itself at the battle of Jena. The university of Jena had already begun to decline with the controversial departure of Fichte and then Schelling, and after a period of closure could not recover its position as a centre of philosophical innovation.

Goethe marked the new epoch in his life that began in 1806 by marrying Christiane Vulpius, with whom he had lived since 1788 and who had borne him several children, of whom only one survived infancy. (Having ceased to be a communicant Christian at the age of 21, Goethe gave his refusal to undergo a church ceremony as his reason for postponing marriage so long.) 1806 also saw the completion of *Faust. Part One*, though publication was delayed until 1808. *Die Wahlverwandtschaften (The Elective Affinities)* (1809) was a kind of reckoning with a decade of Romantic culture, and in 1810, after a long gestation, *Zur Farbenlehre (On the Theory of Colour)* appeared. Much of the next ten years Goethe devoted to autobiographical writings, notably *Dichtung und Wahrheit (Poetry and Truth)* and *Italienische Reise (Italian Journey)*, but from 1814 to 1817 there came a remarkable resurgence of lyric poetry, in imitation of the medieval Persian poet Hafiz, *West-östlicher Divan (The West-Eastern Divan)*. A more sober atmosphere prevailed after the death of Christiane in 1816, and Goethe began to publish, rewrite and reinterpret his earlier studies in natural science. He remained hostile to the Christianizing tendencies in Romantic literature and art, resisted Schelling's proposed election to a chair in philosophy in Jena in 1816, since Schelling wished to combine it with a chair in theology, and favoured instead the appointment of Fries. Schopenhauer and his mother, who had settled in Weimar, were both close friends at this time.

For twenty years Goethe was a regular visitor to the Bohemian spas. At the age of 74, when in Marienbad, he proposed marriage to Ulrike von Levetzow, then 19 years old, and on being refused by her family gave up travelling and spent the last nine years of his life in Weimar preparing the final collected edition of his works. A stream of visitors - including Victor Cousin and Hegel - kept him in touch with European culture, and his list of correspondents - Byron and Carlyle among them - became immense. His last works, in which the theme of renunciation is increasingly prominent, show a concern with problems of world-historical dimensions: the nature of education and culture, the relation of America and Europe, the impending industrial revolution, 'world-literature' (*Weltliteratur*, a term he invented) and the preservation of humane values in a changing world. In addition to rounding off his autobiographical works he wrote a sequel to his major novel, *Wilhelm Meisters Wanderjahre (Wilhelm Meister's Years of Wandering)*, and in his last five years wrote most of *Faust. Part Two*, which was not published until after his death. At his own suggestion, many aphoristic remarks scattered among his papers were collected together as his *Maximen und Reflexionen (Maxims and Reflections)* and published posthumously by his amanuensis J.P. Eckermann, whose *Gespräche mit Goethe in den letzten Jahren seines Lebens (Conversations with Goethe in the Last Years of his Life)* were described by Nietzsche as 'the best German book there is'.

2 Goethe and the philosophers

The philosophical orthodoxy prevailing at all German universities in Goethe's youth was the Wolffian version of Leibnizianism, and throughout his life it is possible to find in his literary and scientific works characteristically Leibnizian traits: in a conversation of 1813 he expressed a preference for 'the Leibnizian term' monad as a description of 'the ultimate primal components of all beings' (see Leibniz, G.W. §§4,5). None the less it was long fashionable to regard Spinoza as the main philosophical influence onGoethe, despite Goethe's own admission thatSpinoza - whom he found 'abstruse' - had an effect on him like Shakespeare and Linnaeus, that is, he showed him the way he could not himself follow. A fragmentary essay of 1784-5, dubbed by its editors 'Studie nach Spinoza' ('Spinozan Study') has little in it that is certainly Spinozan and much that is probably Leibnizian.

Asked by Eckermann in 1827 who was pre-eminent among the modern philosophers, Goethe replied

'Kant…without any doubt'. He first sought help from Reinhold in studying the new system in 1789, and made an attempt at reading the first *Critique*. In 1790, immediately after its publication, he made a careful study of the *Critique of Judgment*, which he ever after regarded as Kant's most important work, particularly the 'Critique of Teleological Judgment' (see Kant, I. §12). In 1794, when his closer acquaintance with Schiller was only beginning, he read Fichte's first systematic writings and could summarize them to their author's entire satisfaction (see Fichte, J.G.). Goethe was aware of, and to a great extent accepted, the Copernican revolution which founded the Idealist period of German philosophy - no one in the world of learning, he wrote in 1805, could ignore it with impunity.

From 1797, after Schiller had turned back to drama, Schelling and F.I. Niethammer were Goethe's main informants about contemporary philosophical developments, and for a while it seemed to Goethe that Schelling might be the man to heal the division between mind and nature which the new philosophy had opened up. Despite some admiration for J.W. Ritter, however, Goethe's attitude to '*Naturphilosophie*' was consistently sceptical. He had less personal contact with Hegel than with Schelling, but had a high opinion of his character and abilities. Given the rapidly changing nature of scientific understanding, though, he doubted whether it was prudent for Hegel to incorporate so much empirical material into his philosophy, and objected to Hegel's continual recourse to the categories of the Christian religion (see Hegel, G.W.F. §8). Goethe thought world history 'the most absurd thing there is', but his relations with Hegel in the last years of his life were genial.

3 Some Goethean ideas

A poem Goethe wrote in 1826 ends:

> What greater gain can a human being have from life than that God-or-Nature should reveal herself to him? - how she dissolves firm material into spirit; how she firmly preserves what spirit has produced.
>
> (1988: 1, 367)

Goethe early became familiar with the Spinozan tag '*Deus sive natura*', and throughout his life 'Nature' was to him an expression of what is most perfect and most worthy of veneration. The content of the concept changed considerably: at first, in Rousseauist manner, it was an antithesis to the 'artificial' and was referred to an almost personal, creative and arbitrary power; later, as Goethe's scientific studies began, Nature was distinguished from the human world by being 'unfeeling', an impersonal repository of passionless order, contrasted with the turmoil of human emotions; later still, once Goethe had absorbed the implications of the Kantian revolution, he regarded the works of the human mind, which to his contemporaries seemed to transcend Nature, as, rather, her supreme product. In so far as this is the position of what Fichte called a 'realist', Goethe could be said never to have deviated from a Kantian belief in the independent reality of things in themselves, though, as he remarks in the essay 'Einwirkung der neueren Philosophie' ('Influence of Modern Philosophy'), his views appeared to Kant's disciples to be 'an analogy of Kantian conceptions, but a strange one'.

The most important single concept in Goethe's understanding of natural processes was that of 'metamorphosis'. (The term 'formation', '*Bildung*', probably borrowed from J.F. Blumenbach, is largely synonymous, but more indeterminate and multivalent.) Early in his botanical studies Goethe gave up the notion that all plants could be related to an ideal type, or 'primal plant' ('*Urpflanze*'), and substituted for it the notion that all vegetable shapes could be understood as the consequences of an ordered but unending series of transformations of a single fundamental organ, called 'the leaf'. An attempt to transfer this concept to vertebrate zoology was abandoned in 1795, under the influence of Kantian criticism, but Goethe's name remained associated with 'metamorphosis' - seen as an early form of evolutionary theory - in nineteenth-century biological textbooks. In Goethe's later years this (Leibnizian) conception of transformation in accordance with an innate rule was associated with two concepts for which he was particularly, though not wholly, indebted to Schelling: 'polarity' (*Polarität*) and 'intensification' (*Steigerung*). Not only is polar opposition held to be fundamental to the natural order (in colour theory, for example, the opposition of blue and yellow), but through 'intensification' opposites have a tendency to transform themselves jointly into a third term on a higher level (in colour theory: red).

However, at least from the time when he began reading Kant, Goethe thought of science not simply as speculation about the order of things, but as the attempt to understand human experience. Natural science was not concerned with an unobservable, mathematically constructed substratum to things (as Newton's optics seemed to imply), but

with the material offered to us in and by our senses. The theories of natural science simply sought to make explicit an order already implicitly present in our observations. Experiments therefore were not devices for confirming or disproving hypotheses, but were the very material of science, and should consist of a large series of observations arranged so as to manifest all aspects of the phenomenon concerned. The ultimate constituents of our knowledge (never completely isolated in practice) are therefore 'primal phenomena' (*Urphänomene*), which are utterly simple manifestations to our senses of what is, and of which no explanation is possible (for any explanation would take us away from our senses into a merely imagined world). An example of the approach to such a 'pure' or 'primal' phenomenon would be the revelation of colour when a prism is held up against a boundary between light and dark.

Writing to Hegel, Goethe called the 'primal phenomena' 'daemonic' (*dämonisch*), which he later glossed as meaning 'which cannot be resolved by the understanding or the reason'. In the Kantian terms of this definition, the 'daemonic' is identical, therefore, with things as they are in themselves. The word, however, which has been the subject of much scholarly controversy, is also applied to personal individuality, especially when strongly marked, and to the operations of chance, of an unfathomable providence (benign or malign) and of some animals (notably, bats and parrots). Although therefore Goethe might at first sight seem to share Hegel's principle that the noumenon is present to us in our experience, he also clearly refuses to identify the noumenon with our own spirit and insists that it is something *given*: human experience - and so human history - is not to be interpreted simply as the realm of the rational. The achievements of Hellenic civilization, for example, are extraordinary gifts of good fortune, not part of some inevitable process - not least because that might imply that their loss was inevitable too. But for Goethe the combination of ethical and sensual perfection in the Greek world can always in principle be recovered in uncovenanted moments of fulfilment, of which works of art are the principal monuments. Our normal lot, of course, is to do without such fulfilment, and to suffer our deprivation, and the absurd disorder of most of what is called world-history, in a spirit of renunciation (*Entsagung*). But that is the mirror-image of our tacit but never abandoned hope that the perfect order will one day be restored.

List of works

Goethe's main works have been mentioned in the text, and most, it will be plain, are at least indirectly relevant to philosophy. The following is a selection of non- or semi-fictional works of more directly philosophical interest (the titles are often editorial, and may be misleading).

Goethe, J.W. von (1887-1919) *Goethes Werke, herausgegeben im Auftrage der Großherzogin Sophie von Sachsen (Weimarer Ausgabe)*, Weimar: Hermann Böhlaus Nachfolger.(Other, more fully annotated, editions exist, or are in progress, but this is, and is likely to remain, the only historical-critical edition. It is available on CD-ROM as *Goethes Werke auf CD-ROM*, Cambridge: Chadwyck-Healey, 1995, supplemented by Goethe's conversations and the letters not included in the edition of 1887-1919.)

Goethe, J.W. von (1988) *Johann Wolfgang von Goethe. Werke. Hamburger Ausgabe in 14 Bänden*, Munich: C.H. Beck, 1988.(A popular students' edition, with commentary. Volume 14 has a comprehensive bibliography; for Goethe and philosophy, see 618-19. Four volumes of selected letters, and two of letters to Goethe, are uniform with the works.)

Goethe, J.W. von (1983-9) *Goethe: Collected Works*, Cambridge, MA: Suhrkamp Publishers Inc., Suhrkamp Edition, 12 vols.(An extensive collection of modern translations, with some notes, and including two volumes of essays, maxims and scientific writing.)

Goethe, J.W. von (1772) 'Brief des Pastors zu *** an den neuen Pastor zu Čast;Čast;Čast;' ('Letter from the pastor of *** to the new pastor of Čast;Čast;Čast;'), in Goethe (1988), vol. 12, 228-39.(Theology of toleration.)

Goethe, J.W. von (1784) 'Über den Granit' ('On Granite') in Goethe (1983-9), vol. 12, 131-4.(Goethe's geological study.)

Goethe, J.W. von (1784-5) 'Studie nach Spinoza' ('A Study Based on Spinoza'), in Goethe (1983-9), vol. 12, 8-10.(Goethe's theory of knowledge.)

Goethe, J.W. von (1790a) *Versuch, die Metamorphose der Pflanzen zu erklären (Essay in Elucidation of the Metamorphosis of Plants)*, in Goethe (1983-89), vol. 12, 76-97. (Goethe's principal work on botany.)

Goethe, J.W. von (1790b) 'Versuch einer allgemeinen Vergleichungslehre' ('Toward a General Comparative Theory'), in Goethe (1983-9), vol.12, 53-6.(His first attempt at a general morphology.)

Goethe, J.W. von (1792) 'Der Versuch als Vermittler von Objekt und Subjekt' ('The Experiment as Mediator

between Object and Subject'), in Goethe (1983-9), vol. 12, 11-17.(Titled in 1823; despite the title the thinking is almost pre-Kantian)

Goethe, J.W. von (1795) 'Plato als Mitgenosse einer christlichen Offenbarung' ('Plato as Party to a Christian Revelation'), in Goethe (1983-9), vol. 3, 200-3.(Against Christian exclusivism.)

Goethe, J.W. von (1798a) 'Einleitung in die Propyläen' ('Introduction to the *Propylaea*'), in Goethe (1983-9), vol. 3, 78-90.(Art theory in a historical context.)

Goethe, J.W. von (1798b) 'Erfahrung und Wissenschaft' ('Empirical Observation and Science'), in Goethe (1983-9), vol. 12, 24-5.(His theory of 'empirical' and 'pure' phenomena.)

Goethe, J.W. von (1799) 'Der Sammler und die Seinigen' (The Collector and his Circle), in Goethe (1983-9), vol. 3, 121-59.(Aesthetic theory in a fictionalized form.)

Goethe, J.W. von (1805) 'Letzte Kunstausstellung. 1805' ('Final Art Exhibition, 1805') in Goethe (1887-1919), part 1, vol. 36, 265-7.(Retrospect on Weimar art competitions.)

Goethe, J.W. von (1817) 'Geistesepochen' ('Stages of Man's Mind'), in Goethe (1983-9), vol. 3, 203-4.(Goethe's philosophy of history.)

Goethe, J.W. von (1817-20) 'Einwirkung der neueren Philosophie' ('The Influence of Modern Philosophy'), in Goethe (1983-9), vol. 12, 28-30.(Goethe's assessment of the influence on him of contemporary philosophers.)

Goethe, J.W. von (1827) 'Nachlese zu Aristoteles' Poetik' ('On interpreting Aristotle's *Poetics*'), in Goethe (1983-9), vol. 3, 197-9.(Goethe's interpretation of 'catharsis'.)

Goethe, J.W. von (1828) 'Erläuterung zu dem aphoristischen Aufsatz "Die Natur"' ('A Commentary on the Aphoristic Essay "Nature"'), in Goethe (1983-9), vol. 12, 6-7. (General theory of Nature - the essay 'Die Natur' ('Nature') is not by Goethe but by G.C. Tobler.)

Good, theories of the

'Good' is the most general term of positive evaluation, used to recommend or express approval in a wide range of contexts. It indicates that a thing is desirable or worthy of choice, so that normally, if you have reason to want a certain kind of thing, you also have reason to prefer a good *thing of that kind.*

A theory of the good may consist in a general account of the good, which is meant to apply to all good things; or in a definition of 'good', an account of how the term functions in the language. Theories of the good have metaphysical implications about the relations of fact and value. Many ancient and medieval philosophers believed in the ultimate identity of the real and the good. Modern philosophers reject this identification, and have held a range of positions: realists, for example, hold that the good is part of reality, while certain moral sense theorists hold that when we call something good we are projecting human interests onto reality; and emotivists hold that we use the term 'good' only to signify subjective approval.

Theorists of the good also categorize different kinds of goodness and explain how they are related. Good things are standardly classified as ends, which are valued for their own sakes, or means, valued for the sake of the ends they promote. Some philosophers also divide them into intrinsic goods, which have their value in themselves, and extrinsic goods, which get their value from their relation to something else. Various theories have been held about the relation between these two distinctions - about whether an end must be something with intrinsic value. Philosophers also distinguish subjective goods - things which are good for someone in particular - from objective goods, which are good from everyone's point of view. Views about how these kinds of goodness are related have important implications for moral philosophy.

Usually, a theory of the good is constructed in the hope of shedding light on more substantive questions, such as what makes a person, an action, or a human life good. These questions raise issues about the relation between ethical and other values. For example, we may ask whether moral virtue is a special sort of goodness, or just the ordinary sort applied to persons. Or, since actions are valued as 'right' or 'wrong', we may ask how these values are related to the action's goodness or badness. We may also pose the question of whether a life that is good in the sense of being happy *must also be a* morally good *or virtuous life. This last question has occupied the attention of philosophers ever since Plato.*

1 History and metaphysics of the good

Almost anything may be assessed as 'good' or 'bad'. This ubiquity of 'good' and its cognates in other languages has suggested nearly opposite conclusions about the metaphysics of goodness to different philosophers. At one extreme we find Plato's view that the good is the fundamental principle of reality. Through works such as the *Republic*, Plato expounded his view that the reality of an object consists in its 'participation' in a 'Form'. A Form is both an archetype or pattern, and an ideal, a perfect version, of the things of which it is the Form. Each Form, because it is perfect, in turn participates in the Form of the Good. A thing is real, then, to the extent that it participates in the Form of the Good.

In *Nicomachean Ethics*, Aristotle criticizes Plato's account for not telling us anything about particular kinds of goodness (see Aristotle §§21-6). Yet Aristotle's own metaphysics retains a version of the equation of goodness and reality. The essential nature of each thing, according to Aristotle, consists in its characteristic activity or function, and it is both most perfect and most real when it performs that function well (see Perfectionism).

These metaphysical views may seem remote from our everyday employment of the idea of goodness. Yet most philosophers agree that the basic insight behind Aristotle's account throws important light on many uses of 'good'. To say that a thing is good is to say that it is a well-functioning thing of its kind, and its well-functioning is related to its reality: a good heart is one that pumps blood well, and a heart that ceases to pump blood altogether ceases to be a heart. This functional account of goodness applies most clearly to things that have purposes - instruments and tools, biological organs, parts of machines, crafts and professions - and it has the advantage of making it clear why we care about having things that are good. But when we say that happiness, or beauty, or freedom, is good, we do not seem to be talking about the performance of a function. Efforts have therefore been made to extend the basic idea of the functional account to things which are not clearly purposive, like people and lives. In *A Theory of*

Justice (1971), Rawls proposes that ‘a good x’ means ‘an x that has the properties it is rational to want in an x’. A good life, for example, has the properties it is rational to want in a life. The goodness of pleasure, freedom, or beauty may then be interpreted in terms of the role these things play in good lives.

The relinquishment of the view that the good coincides with the real marks the transition from the ancient and medieval to the modern world. Modern thinkers confront a value-neutral world, the world of matter and motion described by physics. Modern ‘realists’, although they reject the general equation of the real and the good, still believe that goodness is an objective property of certain objects (see Moral realism). Other modern philosophers believe that goodness is not a property that exists independently of the human mind, but rather some sort of projection or construction out of the needs, desires, and interests of human or sensate beings.

Philosophers of the seventeenth and eighteenth centuries distinguished between the ‘naturally good’ and the ‘morally good’. The naturally good is what is pleasant or desirable or makes us happy. Some early modern philosophers believed that the morally good is constructed out of the naturally good. For example, natural law theorists like Hobbes and Pufendorf thought that naturally good actions become morally obligatory when we are commanded to perform them by God or a sovereign (see Natural law), while sentimentalists, such as Hutcheson and Hume, held that naturally good dispositions - pleasant or useful character traits - are rendered moral virtues by the fact that we approve of them (see Moral sense theories). Rationalists such as Clarke and Price, on the other hand, believed that certain actions have a special kind of moral value which is independent of natural goodness, namely rightness.

By the late eighteenth century the distinction between natural and moral goodness began to blur, but from two opposed directions. Kant (1788) argued that moral goodness is the necessary condition of natural goodness. Happiness purchased by immoral action, for example, is not good at all (see Kantian ethics; Kant, I§§9-11). The utilitarians, by contrast, made natural goodness the source of all value, arguing that morally right actions are simply those that produce the maximum amount of the natural good, happiness or pleasure (see Utilitarianism).

The claim that happiness or pleasure *just is* the good puzzled Moore, who, in the early years of the twentieth century, pointed out that ‘good’ certainly does not *mean* ‘pleasant’ (see Moore, G.E. §1). Moore argued (1903) that any attempt to identify ‘good’ with a natural property is an instance of the ‘naturalistic fallacy’, and that we must therefore suppose that ‘good’ is a ‘non-natural’ property (see Naturalism in ethics §3). This attempt to establish value-realism on linguistic grounds set off a discussion of what the word ‘good’ means, or how it is used. Does it describe some property of objects, or is it used just to prescribe or recommend? The most extreme view is that of the emotivists, who stand in diametric opposition to Plato. Emotivists believe not only that goodness is not the fundamental principle of reality, but that strictly speaking the word ‘good’ does not refer to anything real at all. Its ubiquity, they think, can be explained only by the supposition that ‘good’ is used merely to express the speaker’s subjective approval, like a squeal of delight (see Emotivism).

2 Distinctions in goodness

The most obvious distinction in goodness is that between things which are valued as means, or instrumental goods, and things which are valued as ends, or final goods (see Values). This distinction is often confused with the distinction between intrinsic and extrinsic value. To say that something is intrinsically good is to say that it is good in virtue of what it is - in virtue of its own intrinsic nature; while to say that something is extrinsically good is to say that it is good in virtue of the relations in which it stands to things outside of itself. Means, for instance, are obviously extrinsically valuable, because their goodness springs from the fact that they promote other good things. Ends, by contrast, are often characterized as intrinsically good. In fact, however, it is an open question whether in order to be an end - to be valued or valuable for its own sake - an object must have intrinsic value.

Early twentieth-century moral philosophers debated this question. Empiricists argued that for something to be a final good is just for it to be desired for its own sake; philosophers in the idealist tradition, in contrast, believed that to be a final good is to be the object of a rational will. On both accounts, final goods are extrinsically valuable, deriving their value from the desires or volitions of human beings. But Moore argued that because ‘good’ does not mean ‘desired’ or ‘willed’, it is always an open question whether something desired or willed is good. Final goods, he thought, must therefore be intrinsically valuable. Moore suggested that in order to ascertain whether something is intrinsically good we should use a test of isolation: we consider whether the object has value apart from its

relations to other things. He claimed that when we used this method, we would discover that value belongs to complex states of affairs which he called ‘organic unities’, such as a person’s contemplating a beautiful object, or two friends enjoying each other’s company.

One of Moore’s aims in advancing this theory was to oppose hedonism, the view that pleasure is the good (see Hedonism). Yet the theory that final goods must be intrinsically valuable may push one towards hedonism, as we can see by applying Moore’s isolation test. A beautiful painting must surely be a good thing, yet if we imagine it existing in isolation from all viewers who might enjoy it, it seems to be without value. So we may decide that the value belongs instead to an organic unity consisting of someone’s enjoying the beautiful painting. This line of thought led Moore to conclude that human experiences, especially pleasant ones, are an element in most intrinsically valuable organic unities. But the same idea - that a thing’s goodness cannot be completely independent of its relation to human or sensate experiences and concerns - led utilitarians to suppose that pleasure must be the good.

The categories of value which Kant adopted suggest a different way of thinking about the relation between value and human concerns. Kant distinguished unconditional and conditional value, a distinction that resembles the intrinsic/extrinsic distinction. According to Kant (1785), a thing has unconditional goodness if we value it under any and all conditions, whereas it is conditionally good if the value we accord it depends on circumstances. The only thing we value unconditionally, he argued, is a good will, and human beings as the possessors of the capacity for good will. Yet the things people desire and care about do have conditional value - they are valuable because they matter to people, who have value. In this way, all values are related to human concerns.

If value must be related to human concerns, then we might think that anything that is good must be good *for* someone. Goodness for someone is sometimes characterized as ‘subjective’ or ‘agent-relative’ goodness, as opposed to ‘objective’ or ‘agent-neutral’ goodness, which pertains to everyone. If something is subjectively good for me, then I have reason to promote it and care about it; while if something is objectively good, then everyone has reason to promote it and care about it.

Twentieth-century philosophers have debated the question of the relation between these two kinds of goodness. Some think that goodness is inherently subjective, and people have reason to pursue common objects only when their interests happen to coincide. Others think that subjective values always give rise to objective ones, so that if it is (subjectively) good *for* me to have something, then it is objectively good *that* I should have it. Still others think that some subjective values - say, the ones associated with needs - give rise to objective ones, while others do not. And finally, at the other extreme, there are philosophers who think that subjective values are derived *from* objective ones. According to these philosophers, I cannot claim that something is good for me ‘because it makes me happy’, unless I consider my happiness to be, independently of my personal interest in it, an objectively good thing.

3 The goodness of people

When we call a person ‘good’ are we using ‘good’ in the ordinary sense? Sometimes it seems clear that we are. A person may be good *at* things - talented at sports or crafts, or master of an intellectual discipline. A person may also be good in certain roles - a good mother or teacher, for instance. Aristotle’s functional account of goodness, or something like it, seems to apply to these cases: a good teacher is good at carrying out the functions of a teacher, or has the qualities that it is rational to want in a teacher. But what about when we say that a person is good, just as a person?

In fact there are two different ways in which people are said, just as people, to have value. Ordinarily, when we say of a particular person that they are ‘a good person’, we mean that they are morally good or virtuous. Aristotle applied his functional account of goodness to moral virtue in a straightforward way. He identified reason as the human function, meaning that what is distinctive of human beings is the use of reason to govern our activities. Virtues are qualities that foster the good performance of this function. Both Plato and Aristotle compared moral virtue to health: it is a way of being in good psychological condition. The functional account has also been used in a more broadly social way to explain moral goodness. On this view you are morally good if you are good at the performance of all of your various social roles, or if you have the qualities it is rational for your friends and fellow citizens to want in a friend and fellow citizen; or, as in certain sentimentalist theories, if you are an object of moral

approval because you have these qualities (see Virtues and vices §§2-3).

Those accounts identify moral goodness with the possession of certain dispositions - character traits - that influence a person's conduct. Philosophers who favour such accounts usually suppose that your actions issue directly from your character. But other philosophers claim that human beings have a power distinct from and more directly related to actions than character traits are, namely the will (see Will, the). The will enables you to act freely, even to the point of doing what is 'out of character'; and it makes you responsible for your actions, even when they seem to be determined inevitably by your character. Kant, accordingly, recognized a form of moral goodness distinct from virtue or the goodness of character traits, namely goodness of the will or *moral worth*, which pertains to the well-functioning of the will itself, either as it is exercised in particular actions, or as a standing disposition. Kant famously claimed that you may achieve moral worth even if you have temperamental qualities which make it hard for you to do what duty demands (see Self-control). This claim raises important questions about how the will and character are related.

The second way in which people are considered to be valuable just as people, enshrined in many religious and philosophical systems, involves the thought that every human being as such has a fundamental value which it is wrong to deny or overlook. The religious view that we are all God's children, the political view that all human beings are created equal, and the Kantian moral view that every human being is an end-in-itself are all expressions of this idea. There are various views about what makes people valuable in this way - freedom of the will, rationality, consciousness, the possession of identifiable interests, the capacity for pleasure and pain, or simply life itself - and so what treatment is called for. Some of these options raise the question whether other living things should also be accorded such value (see Moral standing §§1-3). This kind of value is different from that which we attribute to particular people when we say they are morally good, for one need not be an especially good person to lay claim to the political rights or the moral respect due to every human being. But the two ideas are sometimes related by the thought that it is the capacity for moral goodness, or the capacity that makes us capable of moral goodness, that gives us this fundamental value (see Respect for persons).

4 The right and the good

Good is a ubiquitous term, applying to almost any sort of thing, but actions, policies and laws are also praised as being 'right' or 'just'. Right actions are those which are required by morality or, more extensively, those not forbidden by morality, not 'wrong'. So a question arises about the relation between these two kinds of value, the right and the good. Consequentialists think that the relation is simple: right actions are those which tend to maximize good results, so that rightness is actually a form of instrumental goodness (see Consequentialism). Yet we sometimes seem to care about doing the right thing independently of, or even in the teeth of, the consequences that it produces. We may decide that we will uphold someone's rights, or obey the law, or keep a promise, though we know the results will be bad, because, as we say, 'it is the principle of the thing'. Consequentialists think this attitude is either an acknowledgement of the especially important consequences that result from the observance of certain rules, or else a misguided form of rule-worship. But 'deontologists' believe there is something valuable about doing the right thing apart from the good results it may or may not produce (see Deontological ethics).

Since deontologists deny that rightness is merely an instrumental value, we might be tempted to say they think of rightness as either a final good or a special kind of intrinsic value, characteristic of actions. But this does not completely capture the deontological intuition. Final and intrinsic values, as they are often conceived, may be weighed in with other values, so on this view we might sometimes endure wrongdoing, as we sometimes endure pain, for the sake of the larger benefits it brings. But deontologists deny that such values as freedom, justice, or fidelity may be traded off for other goods. They also believe that the way in which right actions serve these values is not by producing or causing them, but instead is direct or constitutive. For example, a deontologist may think that it is right to keep a promise, not because fidelity to promises is thereby efficiently produced (for we can imagine circumstances in which one person's keeping a promise will induce others to break theirs), but because it is an act of fidelity. And we respect human rights, not because this produces freedom, but because this is what freedom consists in - living in a world in which human rights are respected.

The question of the relation between the right and the good therefore gives rise to deep questions about the relations between actions and the values they serve. But these questions belong more properly to a discussion of the right (see Right and good).

5 The good life

One of the oldest questions of moral philosophy is what the best life is for a human being. A standard view in ancient Greek philosophy was that there are three types of life: a contemplative or philosophical life; a life of virtuous political activity; and a hedonistic or money-making life. Plato and Aristotle agreed that the contemplative life is best and the political life second best; in their view, only those who do not know the true pleasures of contemplation and virtuous action resort to hedonistic pursuits (see Eudaimonia; Hedonism).

The idea that so specific a life can be identified as best may seem paradoxical. If there is a best life for human beings, does that mean it is the best life for any human being, regardless of personal endowments or natural tastes? On this view, lives are like looks: there may be a best way for each person to look, but the best way for you to look may not, unfortunately, be the best way to look. Some philosophers argue that this makes no sense: how can a certain way of life be better for you, if there is no way in which you could enjoy, appreciate, or be interested in such a life and still be *yourself*?

What sorts of arguments might be used to show that one type of life is best? Plato favoured a test of experience: we should take as authoritative the preferences of those people who have experienced the kinds of activities central to all three types of life. John Stuart Mill (1861) suggested that this test could be used to identify those pleasures whose ‘quality’ is so high as to outweigh considerations of ‘quantity,’ and so which belong in the best life (see Mill, J.S. §9). Aristotle appealed to his own idea of function: if human beings have a function, the person who performs the human function well must lead the best life. But Aristotle also thought we could identify certain criteria which any good life must meet, and rate lives by the extent to which they fulfil these criteria: the pursuits central to a good life must be active, pleasant, self-sufficient, and done for their own sake alone. Moore’s theory suggests a simpler account: the good life is one that consists of intrinsically valuable states and activities, such as appreciating beauty, having friends, and seeking knowledge.

Perhaps the most common strategy is to appeal to human psychology, to what people actually care about. Classical utilitarians argued that human beings care about only two things: getting pleasure and avoiding pain. The best life must therefore be the one with the greatest balance of pleasure over pain. Others claim that the goodness of your life is a function of how many of your desires are satisfied and the strength of those desires. But the content of your desires and their strength may be determined in unfortunate ways by the limitations of your knowledge or imagination, and this has led some philosophers to adopt an idealized version of this account: the good life for you is the one you *would* choose under conditions of perfect knowledge and imaginative reflection.

But we must also ask whether the *good* life and the *happy* life are the same. The early modern philosophers’ distinction between moral and natural goodness brought this question sharply into focus. They thought of happiness as a natural good and many of them believed that reason demands the pursuit of happiness just as obviously as it demands the practice of virtue. Yet virtue does not always bring happiness. Are human beings then subject to conflicting demands of reason? Ancient Greek philosophers had raised a parallel question, whether being virtuous is a good thing for the virtuous person. But ancient and modern solutions are different in an important way. For the Greeks, the answer lay in demonstrating that the qualities we ordinarily regard as moral virtues really are qualities that make us good at the performance of the human function - qualities without which we would be incapable of choosing and acting well. Once this is established, it is evident that a virtuous person will necessarily have a better life. Modern philosophers, however, are more inclined to believe that happiness and virtue are independent. Many modern philosophers have therefore tried to produce what Rawls calls ‘congruence’ arguments: arguments that show that the pursuit of virtue will also bring happiness, and so that the two kinds of good, although independent, come together in practice. But others have drawn a more austere conclusion, namely that a life which is both morally good and happy is open to us only in favourable circumstances - circumstances which must be secured by divine arrangements or, more optimistically, by political action.

Goodman, Nelson (1906-)

Nelson Goodman is an American philosopher who has written important works in metaphysics, aesthetics and epistemology. Throughout his work runs a concern with the ways that the symbols we construct inform the facts that we find and structure our understanding of them. Different symbol systems yield irreconcilable structures. So there is no one way things really are. There are, he concludes, many worlds if any. Moreover, worlds are made rather than found, for the categories we construct fix the criteria of identity for the individuals and kinds we recognize. Thus they determine what objects and kinds constitute a world.

Goodman argues that the arts as well as the sciences make and reveal worlds. Aesthetics as he construes it is a branch of epistemology. He analyses a variety of modes of symbolization, literal and metaphorical, and shows how they contribute in the arts and elsewhere to the advancement of understanding.

Goodman's 'new riddle of *induction' reveals that the problem of induction runs deeper than philosophers had thought. He defines the predicate 'grue' as 'examined before future time* t *and found to be green or not so examined and blue.' All emeralds examined to date have been both green and grue. What justifies our expecting future emeralds to be green rather than grue? Inductive validity, the new riddle shows, turns not only on the constitution of an evidence class, but also on its characterization. The question then is what favours one characterization over its rivals. The fact that 'green' has been used far more often than 'grue' in induction, Goodman contends, provides the answer - not because it increases our odds of being right, but because of its pragmatic advantages.*

1 Metaphysics

Nelson Goodman has made groundbreaking contributions to aesthetics, epistemology, metaphysics and the philosophy of science. In his youth he ran an art gallery. Throughout his life he has been an avid and eclectic collector of art. He founded the Harvard Summer Dance programme and Project Zero, an ongoing research programme in arts education at the Harvard Graduate School of Education. As graduate students at Harvard, he and Henry Leonard developed a version of mereology that they dubbed 'the calculus of individuals'. Elaborated in *The Structure of Appearance*, it forms the basis for Goodman's nominalism. As Goodman construes it, the difference between mereology and set theory lies in the sorts of constructions they permit. Set theory admits infinitely many distinct entities - sets of sets of sets of sets … - all composed of the same basic elements. Mereology holds that the same basic elements are parts of but a single whole. Goodman's nominalism consists in a refusal to recognize more than one entity comprised of the same basic elements. It says nothing about the metaphysical constitution of the elements. The decision of whether to countenance abstract or concrete, immaterial or material, mental or physical entities requires more than a commitment to nominalism.

The constructionalism Goodman espouses in *The Structure of Appearance* is a methodology for systematizing a body of pretheoretical beliefs. Such beliefs tend to be inchoate, vague, even inconsistent. By devising an interpreted formal system that derives them from or explicates them in terms of a suitable base of primitives, we can bring them into logical contact with each other, eliminate inconsistencies and disclose unanticipated logical and theoretical connections. Were such a system required to reflect all our relevant pretheoretical beliefs exactly, it would simply replicate received errors and confusions. But, Goodman argues, the regimentation constructionalism countenances involves judicious correction, refinement and even repudiation of presystematic convictions in the interests of simplicity, coherence, theoretical tractability and the like.

Multiple, divergent systems do justice to the same range of pretheoretical beliefs. One system might identify a geometrical point with the intersection of two non-parallel lines. Another might identify it with the limit of a sequence of nested spheres. Neither invalidates the other, for each provides a geometrically acceptable definition of a point. Here lies the root of Goodman's relativism. Relative to each acceptable system, the constitution of a point is determinate. But absolutely and independently of the systems we construct, it is indeterminate.

In *Ways of Worldmaking*, Goodman provides a less formal treatment of the same themes. Worlds and the objects that comprise them are made, he contends, not found. The members of any group are alike in some respects, different in others. So mere inspection cannot settle whether two manifestations are of the same thing or of the

same kind. To answer such questions we require a category scheme or system of classification that distinguishes differences that matter from differences that do not. Such schemes are not dictated by nature, but are human constructs. We draw the lines. Lines can be drawn in various places, resulting in divergent but equally viable world versions. One person might count a newspaper with a new publisher and a radically revised editorial stance as the same newspaper it always was. Another might count it as a different newspaper. One might classify a black hole as a star, another as the residue of an extinguished star. Relative to its own world version, each is right. Relative to its rival's, each is wrong. Neither is absolutely right or wrong.

If all overlapping world versions were reducible to or supervenient on a single base, such divergences would be insignificant. But, Goodman insists, such is not the case. In *The Structure of Appearance* he develops a phenomenalist constructional system whose primitives are qualia - phenomenal individuals out of which enduring perceptibles are constructed. He does not claim that this is the only viable form of phenomenalism and he recognizes that it neither underwrites nor reduces to a physicalist system. But it is none the worse for that. Rather, he urges that physicalist and phenomenalist systems are distinct, valid constructions of independent interest and importance. Neither is parasitic on the other.

If the proliferation derives from the availability of clashing category schemes, why not take it to show simply that there are multiple conceptualizations? Then we could retain our pretheoretical conviction that there exists exactly one world underlying them. Were the analytic/synthetic distinction tenable, such a strategy might work. But as Goodman, W.V. Quine, and Morton White demonstrated, it is not. Although statements depend on both meaning and fact, the dependence on meaning cannot be separated from the dependence on fact. There is thus no way to make sense of the claim that the difference between clashing world versions derives from different ways of conceptualizing the same facts. Category schemes dictate the criteria of identity of their objects, so mutually irreducible schemes do not treat of the same things. Since a world is the totality of things that comprise it, irreducible schemes define distinct worlds. There are, Goodman concludes, many worlds if any.

Still, it is not the case that just anything goes. Goodman describes his position as relativism under rigorous restraints. Consistency, coherence, suitability for a purpose, as well as accord with past practice and antecedent convictions are among the restraints he recognizes. Fitting and working are the marks of a successful version. A world version must consist of components that fit together; it must fit reasonably well with our considered judgments about the subject at hand, and must work to further our cognitive objectives. A version that is internally incoherent, is inconsonant with our antecedent considered judgments or impedes the advancement of understanding is unacceptable. Worldmaking need not be deliberate. *Ways of Worldmaking* discusses how, with only sparse cues, the visual system constructs the apparent motion it discerns. Nor is worldmaking exclusively the province of science - the arts as well as the sciences make worlds.

2 Aesthetics

Works of art, Goodman contends, are symbols. As such, they require interpretation. The aesthetic attitude, then, is not one of passive contemplation, but of active cognitive engagement; its main goal is understanding, not pleasure. Aesthetics, as Goodman conceives it, is a branch of epistemology.

Languages of Art characterizes a range of symbol systems used in the arts and elsewhere, and identifies the syntactic and semantic structures that give rise to their powers and limitations. The basic modes of reference are denotation and exemplification. Denotation is the relation of a name to its bearer, a predicate to the members of its extension, a picture to its subject. 'Charles I', 'the father of Charles II' and a Van Dyck portrait all denote Charles I. Fictional symbols lack denotata. Their significance, Goodman maintains, derives from symbols that denote them. Although the term 'unicorn' fails to denote, the terms 'unicorn-description' and 'unicorn-picture' denote a variety of symbols that collectively constitute the meaning of the term 'unicorn'. Many works of art - abstract art, most instrumental music and much dance - do not even purport to denote. They refer, Goodman maintains, by means of exemplification. In exemplification, a symbol points up and hence refers to features it serves as a sample or example of. Thus, a commercial paint sample exemplifies its colour and sheen; a late Mondrian painting exemplifies squareness. Exemplification is widespread not only in the arts but also in science, commerce and pedagogy - indeed wherever samples and examples are used.

Denotation and exemplification are not mutually exclusive. Denoting symbols in the arts typically also exemplify.

A portrait by Whistler denotes his mother and exemplifies a seemingly infinite spectrum of shades of grey. Seventeenth-century Dutch still lifes denote opulent arrangements of flowers and fruit and exemplify ambivalence about worldly success. Symbols, particularly aesthetic ones, often perform a variety of interanimating referential functions.

Symbols normally do not operate in isolation. They belong to schemes that collectively sort the objects in a realm. In metaphor a scheme that normally sorts one realm is imported to effect a re-sorting of another. New groupings emerge as items that belong to disjoint literal categories are classed together under a single metaphorical label and affinities between literal and metaphorical referents of a term are brought to light. In calling a plumber a virtuoso, for example, we import a scheme that literally sorts musicians to effect a sorting of craftsmen. New patterns and distinctions emerge as we recognize the delicacy, dexterity and skill displayed by some few members of the several crafts. Because they draw their lines where no literal label does, metaphors resist paraphrase. No literal label quite captures what all and only the virtuosi in the building trades have in common with one another or with literal virtuosi.

Figurative reference is real reference, Goodman maintains, and figurative truth is real truth. ‘Feline cunning’ genuinely if metaphorically denotes some scheming politicians. ‘The walls of the Alhambra are made of lace’ is genuinely if metaphorically true, and Michelangelo’s *Pietà* genuinely if metaphorically exemplifies incalculable sorrow.

Expression, he contends, is metaphorical exemplification by a work of art functioning as such. The *Pietà* then expresses the incalculable sorrow it metaphorically exemplifies. But expression is not limited to emotions. A work of art, functioning as such, expresses any feature it metaphorically exemplifies. Thus, for example, Brancusi’s *Bird in Space* expresses fluidity and flight. There is, evidently, no limit on the range of features that works of art can express.

Reference is not always direct. In indirect reference, one symbol refers to another by means of a chain consisting of denotational and exemplificational links. Rembrandt’s *Night Watch* alludes to the history of the militia it depicts by portraying its subjects wearing costumes that exemplify important periods of the militia’s history. In *Reconceptions* Goodman construes variation as a form of indirect reference, where a variation must in some respects resemble its theme and must differ from it in others. But every two passages do that, and not every passage is a variation on every other. A symbol functions as a variation on a theme when it uses the resemblances and differences as routes of reference to the theme. It exemplifies features it shares with the theme, contrastively exemplifies features it does not share with the theme, and effects reference back to the theme via both exemplification and contrastive exemplification. On Goodman’s analysis, variation is not restricted to music. Nor need a variation occur in the same work as the theme on which it is a variation.

Scientific symbols tend to be attenuated, symbolizing along comparatively few dimensions, whereas aesthetic symbols are relatively replete. For example, the same configuration might serve as an electrocardiogram or a line drawing. In an electrocardiogram, only its shape is significant, whereas in a line drawing, the exact colour and thickness of the line, the precise shade of the background, the size and shape of the paper, the position of the line on it and even the texture of the paper may be significant. The electrocardiogram is referentially austere denoting a pattern of heartbeats and perhaps exemplifying a certain symptomatology. The drawing, however, is apt to perform a variety of interanimating referential functions.

Whether the symbol is an electrocardiogram or a drawing depends on its function. It counts as a work of art as long as it functions as an aesthetic symbol. And it may do so intermittently. The crucial question for Goodman is not ‘What is art?’ but ‘When is art?’, that is, ‘Under what circumstances does an object function as an aesthetic symbol?’ He gives no criterion, but identifies five symptoms of the aesthetic: syntactic density, semantic density, relative repleteness, exemplification and complex and indirect reference. A symbol system is syntactically dense when the finest differences between signs constitute a difference between symbols, that is, when it can mark the finest differences between items in its domain. Symptoms, Goodman acknowledges, are neither necessary nor sufficient conditions. But they are good, if defeasible, indications of the presence of a condition.

Interpretation requires discovering what symbols constitute a work, how they function, what they refer to and what they achieve. The richness and complexity of aesthetic symbols means that the task may be interminable and that

multiple, irreconcilable interpretations may be correct. But not every interpretation is correct. Only those that make maximally good sense of the work's symbolic functions are to be accepted. Goodman's pluralism consists in his recognition that more than one interpretation can often do so.

3 Induction

Symbol systems are artefacts. Their syntactic and semantic features are not dictated by the domain but result from decisions about how the domain is to be organized, which can be done in an enormous number of divergent ways. Acceptability of a symbol system depends on its suitability for the purposes at hand.

In empirical science and elsewhere the purpose is often inductive - a matter of projecting from limited evidence to a wider class of cases. The traditional problem of induction is to say when and to what extent a limited evidence-class warrants such an inference. How many emeralds need be examined and from what sources need they be drawn before we are justified in inferring that all emeralds are green? In *Fact, Fiction, and Forecast*, Goodman shows that the problem runs deeper. It is a matter not just of the composition of the evidence class, but also of its characterization. He defines novel predicates 'grue' and 'bleen' as follows:

x is 'grue' = *x* is examined before future time *t* and is found to be green, or *x* is not so examined and is blue.
x is 'bleen' = *x* is examined before future time *t* and is found to be blue, or *x* is not so examined and is green.

All emeralds examined to date have been grue as well as green, for the extensions of the two predicates do not yet diverge. Yet we confidently expect emeralds found after *t* to be green, not grue. What, if anything, is our justification?

We can't dismiss 'grue' as derivative from 'green', for 'green' can be defined in terms of 'grue' and 'bleen', just as 'grue' is defined in terms of 'green' and 'blue':

x is 'green' = *x* is examined before future time *t* and found to be grue, or *x* is not so examined and is bleen.

Which predicate is basic and which is derivative depends entirely on where we start. Nor can we dismiss 'grue' on the grounds that it makes essential reference to a specific time *t*. For whether 'grue' or 'green' makes reference to *t* again depends on which is taken as primitive. One might argue that 'green' marks a more natural kind than 'grue' does. Then it is, in some sense, essentially more primitive. But in the absence of an acceptable standard of naturalness that does not presuppose the very differences in projectibility we are trying to account for, this claim rings hollow. For we neither know what it means, nor how to tell whether one predicate is more natural than another.

The solution, Goodman maintains, lies in entrenchment. What favours 'green' over 'grue' is the brute fact that 'green' and its cognates have been successfully projected far more often than 'grue'. The fact that up to now 'grue' would have worked as well is irrelevant. The decision favours the predicates that were actually successfully used.

Induction provides no guarantees. Goodman recognizes that we currently have no way of knowing whether future emeralds will be grue, green or something else entirely. The problem as he sees it is how to proceed in the absence of such knowledge. He argues that entrenched predicates are to be preferred, not because they have any lien on the future, but because they have served us well so far, and their continued use enables us to make efficient use of available cognitive resources and habits of thought. But the presumption in favour of entrenched predicates evaporates as soon as counterexamples emerge. When the first non-green emerald is found, 'All emeralds are green' loses its claim on our epistemic allegiance.

The emphasis on entrenchment does not preclude innovation. Novel predicates can be projected when entrenched hypotheses are violated. Thus, for example, the Michelson-Morley experiment, by violating Newtonian generalizations, opened the way for the projection of novel, relativistic predicates. New predicates can also be introduced at interstices where no entrenched predicate prevails. A term like 'quark' can be introduced to denote phenomena that previously lacked a label. Such terms, Goodman maintains, derive their projectibility from related terms such as 'subatomic particle'. Novel predicates thus become projectible by fitting into working inductive systems or into replacements for systems that do not work.

Goodness, perfect

The concept of perfect goodness had a central place in ancient Greek and medieval philosophy, and is still frequently discussed in contemporary natural theology. Medieval philosophers adopted the idea from the philosophies of Plato and Aristotle, with the difference that they identified perfect goodness with a personal God. In ancient and medieval philosophy the concept is primarily a metaphysical one, since goodness was thought to be extensionally equivalent to being, but it is secondarily a moral concept referring to the distinctive sort of goodness appropriate to those beings that have wills. Thus it is fundamental to a long tradition on the metaphysical basis of value which lasted from Plato until at least the sixteenth century.

In Plato, perfect goodness is the Form of the Good, upon which everything that has being is ontologically and causally dependent. In Aristotle, the good is identified with the end or purpose of a natural being. The good is that towards which all things move for the fulfilment of their natures. By the time of Aquinas, medieval philosophers had identified the good in both the Platonic and Aristotelian senses with the Christian God and had argued that God is both the perfectly good creative source and the perfectly good end of all beings other than himself.

The concept of a perfectly good being in Christian philosophical theology faces two major kinds of difficulty. One is the problem that perfect goodness appears to be incompatible with the divine attributes of omnipotence and freedom of the divine will. And if a perfectly good being does not have a will that is free in a morally significant sense, that being seems to lack goodness in the moral sense of goodness. The second kind of problem is that the existence of a being who is both omnipotent and perfectly good seems to be incompatible with the existence of evil. In spite of these problems, there is a strong attraction to the idea of a perfectly good God in contemporary philosophical theology. The category of perfect goodness is therefore one of the most persistent of the concepts in the Platonic legacy.

1 Perfect goodness in Greek and medieval philosophy

In Plato’s metaphysics it is the Form of the Good, not the Form of Being, which is at the pinnacle of the realm of the Forms (see Plato §14). Since any object of kind *K* is real to the extent that it approximates perfect *K*-ness, the better an object is as a *K*, the more real it is. The source of the being of any individual object of kind *K* is the Form *K*, and the individual Forms themselves derive their being from the Form of the Good. In Plato, then, perfect goodness is ultimately the source of the being of everything else. In the *Republic*, Plato asserts the dependency of everything on the Form of the Good by the relation of participation. In the *Timaeus*, Plato develops the Theory of Forms into a cosmological theory according to which all things in the physical world are caused to be by emanation from the Form of the Good, and ultimately return to it.

Aristotle (§§9, 16-17) introduced the connection between the idea of the good and the notion of an end. Each thing of kind *K* has an end or purpose (*telos*) which is the fulfilment of the nature of things of kind *K*, and an individual is good to the extent to which its nature is actualized. Since desires are related to ends, the notion of an end gives desire a role in achieving an end. Aristotle’s teleological theory of nature therefore includes a teleological view of human psychology. Aristotelian natural teleology had a significant impact on the treatment of the concept of the good in later philosophy.

One of the most important features of the concept of goodness arising from Greek philosophy was the identification of goodness with being. The idea that everything is good in so far as it exists leads to the position taken explicitly by Augustine (§§7, 9) in the *Confessions* that evil is only the privation of being. This means that good and evil are not ontologically on a par and, with certain other assumptions deriving from Greek metaphysics, it led to the view that perfect goodness can and, in fact, must of necessity be actualized, whereas perfect evil cannot be. Furthermore, on the view that everything is good in so far as it has being and evil is only a privation of being, it seems to follow that evil is metaphysically necessary if anything exists besides a perfect being. The doctrine that evil is only a privation of being, therefore, suggests a way out of the problem of evil (see §3 below).

Boethius (§2) defended the thesis that everything is good in so far as it exists in the first of his five theological treatises, which became known as *De hebdomadibus*. There he explains how substances can be good in virtue of the fact that they have being even though they are not good in virtue of their substance or nature. Goodness does

not constitute the substance of created substances, but constitutes the substance only of God, from whom all things proceed. Every created substance is therefore good in that it flows from the first and perfect good.

Thomas Aquinas (§§2, 9) synthesized a number of elements of the pre-existing tradition on perfect goodness. Like Plato, he believed that creatures are good by virtue of participation in divine perfect goodness; the created universe is an outpouring of the goodness of God. As Aquinas reads Aristotle, in every genus there is something highest that is the cause of the other members of the genus. Aquinas employs this view in his ‘Fourth Way’ of proving the existence of God:

> That which is said most of all to be such and such in some genus is the cause of all the things that belong to that genus. In this way fire, which is hot to the highest degree, is the cause of all hot things, as is said in *Metaphysics*, Bk II. Therefore there exists something that is the cause of being and goodness and any perfection in all things; and this we call God.
>
> (*Summa theologiae* Ia, q.2, a.3)

In another work he says, ‘Therefore, the highest good [*summum bonum*], which is God, is the cause of goodness in all things’ (*Summa contra gentiles* III, 17: 2). Aquinas follows Aristotle in identifying the good of a thing with its complete being and its end as the achieving of its complete being. And he follows Aristotle’s view of the will as naturally directed towards the proper end of the willer, which is the good for the willer. He follows Augustine and Boethius in identifying good with being and perfect goodness with pure being, in which there is no potentiality unactualized.

After its high point in late medieval philosophy, there was a decline of interest in the concept of perfect goodness. But in the later twentieth century there has been both a resurgence of interest in medieval philosophy and a renaissance in the philosophy of religion. Part of the work in these areas has focused on an approach to theology in which the concept of a perfectly good being occupies the centre of attention. Some of this work aims at reworking medieval philosophy into the contemporary milieu. Other work aims at defending the concept of perfect goodness from the kinds of objection many contemporary philosophers find compelling. Some of the puzzles most commonly addressed will be the subject of the next two sections.

2 The possible incompatibility of perfect goodness with other divine attributes

The idea of a God who is the personification of perfect goodness creates problems when combined with some of the other traditional attributes of the deity. In particular, three problems of compatibility have been discussed in the recent literature, and some of them have a long history.

First, there is the alleged incompatibility of perfect goodness and omnipotence. A perfectly good being was traditionally understood to be one whose will is so fixed in goodness that he is actually incapable of willing anything other than good, a property sometimes called ‘impeccability’. An omnipotent being is one who has maximal power, and while there are many different accounts of what maximal power entails, it has often been understood to involve the power to do anything possible (see Omnipotence §§1, 5). But since sinning or doing evil is a possible thing to do, if a perfectly good being lacks the power to do evil, such a being lacks the power to do something possible and hence is not omnipotent. This puzzle has recently been articulated by Pike (1969), but it was also known to Aquinas and other medieval philosophers.

Aquinas’ way out of this problem was to deny that the power to do evil is a power in the true sense (*Summa theologiae* Ia, q.25, a.3, ad.2), and many philosophers subsequently have taken some version of this approach. To be successful, this approach must elucidate a plausible concept of power which includes what is intuitively desired in the powers of the deity but excludes what is not desired. A different approach is to argue that God *can* do evil, but simply does not. Reichenbach (1982) maintains a position of this kind. Clearly, this move uses a different notion of the nature of perfect goodness from one in which perfect goodness is entailed by God’s very nature. Taking this approach involves weakening the metaphysical connection between God’s nature and being, on the one hand, and his goodness, on the other. A third solution to the problem is to claim that God has the power to do anything possible, including the things which are, in fact, evil, but if he were to do such things, they would not be evil. This approach utilizes the ‘divine command’ theory, according to which God’s will and God’s nature are prior to morality, although perhaps not prior to good in the metaphysical sense of good as pure being (see Religion

and morality §1; Voluntarism). Divine command theories claim that what is morally right (or good) is made to be right (or good) by God’s will. A frequently mentioned problem with this approach is that it makes God’s will appear to be arbitrary. This is because God cannot have a moral reason for willing as he does, since it is his will that determines what counts as a moral reason. In addition, a divine command theory seems to make the concept of perfect goodness vacuous. That is, there is no content to the property of goodness other than this: goodness is whatever it is that God is, and rightness is whatever it is that God wills.

The reasoning behind the alleged incompatibility of perfect goodness and omnipotence leads to a second difficulty. Under the assumption that a perfectly good being is incapable of doing wrong or willing anything but good, the will of such a being does not appear to be free in any morally significant sense (see Freedom, divine). On a common interpretation of the conditions for moral praise and blame in the human case, persons are morally praised because they choose good when they could have chosen evil instead, and they are morally blamed because they choose evil when they could have chosen good instead. The understanding of the conditions of moral praise and blame as entailing the ability to do otherwise was not stressed prior to the modern era, but it is also one which many philosophers think important (see Free will; Praise and blame §4). But then, on the understanding of perfect goodness as involving the inability to will evil, a perfectly good being is not free in a morally significant sense. And it then seems to follow from that that a perfectly good being cannot be praised in the moral sense of praise because he lacks morally significant freedom, and so cannot be good in the moral sense of good. This leads to a third and even more serious problem. If the concept of perfect goodness is intended to include moral goodness and yet the concept of perfect goodness is inconsistent with the concept of moral goodness, as allegedly demonstrated by the foregoing argument, it seems to follow that the concept of perfect goodness is self-inconsistent.

An interesting attempt has been made to use the Thomistic doctrine of divine simplicity (see Simplicity, divine) to resolve the above puzzles about the compatibility of perfect goodness with other divine attributes. According to Aquinas’ concept of simplicity, there is no composition in God at all, so God does not even have attributes, even though it is necessary for us to think of God as having attributes because of the limitations of our finite minds. As this doctrine is described by Stump and Kretzmann (1985), the actual referent of such terms as ‘divine omnipotence’, ‘divine goodness’ and ‘divine being’ is the (simple) divine nature, and so there can be no conflict in reality between any pair of attributes.

3 Perfect goodness and the problem of evil

Even if the problem of the alleged inconsistency of perfect goodness and omnipotence can be resolved, there is still another difficulty. The combination of these two attributes leads to one of the most intractable of all theological problems, the problem of evil (see Evil, problem of). This problem has a number of forms, but it most directly threatens the concept of perfect goodness by way of the following argument: (1) a perfectly good being would be motivated to eliminate all evil; (2) an omnipotent being would be able to eliminate all evil; (3) if a being is both motivated to eliminate evil and is able to do so, he would do so; (4) so if there was a perfectly good and omnipotent being, evil would not exist; (5) but evil does exist; therefore, (6) there is no being who is both perfectly good and omnipotent.

Defences of the compatibility of evil with divine omnipotence and perfect goodness generally focus on modifying either premise (2) or premise (3) of the above argument, or on interpreting them in such a way that (4) does not follow. It is virtually always taken for granted that a perfectly good being is motivated to prevent or to eliminate evil, and so premise (1) is usually accepted by all sides of the discussion. Theists looking for ways out of the dilemma then typically look for reasons why a perfectly good God would permit evil for the sake of some good - often the good of free will or, in general, the good of the world and its creatures. The idea is that a certain kind and amount of evil is a logically necessary prerequisite for obtaining such good.

But there are ways of understanding the concept of perfect goodness which are both faithful to the tradition of reflection on the concept and which lead to the denial of (1) in the sense intended in this dilemma. One is suggested by the divine command theory mentioned in §2. Since divine command theories maintain that what is right or good is determined to be right or good by the will of God, they maintain (1) only in the trivial sense that since good just is what God wills, and since it is trivially true that God is motivated to will what he wills and is not motivated to will what he does not will, then God is motivated to will good and not to will evil. Such an interpretation of (1) does not generate the problem of evil. A modification of this approach is to attempt to ground

God's perfect goodness in those conditions of his nature out of which his will arises, but without making his will primary. One way this might be done is to make motivations the primary good. If God's motivations are an intrinsic feature of his nature and hence good in the primary sense, it follows that good is not something against which the motivations of a good being are to be measured. Instead, the dependency goes the other way. What is good is good because a perfectly good being is motivated to bring it about. It is not the case that a being is good in part because his motivations are to do or to bring about good. On this approach there is no independent conception of good for the sake of which a perfectly good being derives its motivations and for the sake of which he permits some independent conception of evil. This approach could be called a 'divine motivation' theory rather than a divine command theory.

Another way out of the problem of evil raises one of the deepest questions on the metaphysics of value. This is the view that evil does not exist at all. This approach has been favoured at various times in the history of philosophy, but the present era is not one of them. Both inside and outside professional philosophy, many persons believe that the twentieth century has been especially evil and that it is no longer tenable to maintain that evil is a subjective reaction to the undesirable rather than an active and virulent force in history and human life. This attitude threatens the viability of the concept of perfect goodness to the extent that on the traditional conception, a perfectly good being does not *compete* with evil or evil beings. Unlike some of the religions of the East, Western philosophy and religion have never understood good and evil to be on the same level, either ontologically or practically (see Evil). For this reason the concept of perfect goodness has been able to exert a hold on the philosophical imagination far greater than it would have done if evil had been supposed to be an equal combatant.
